XiVO is an application suite developed by [Avencall](#) Group, based on several free existing components including [Asterisk](#), and our own developments to provide communication services (IPBX, Unified Messaging, ...) to businesses.

XiVO is [free software](#). Most of its distinctive components, and XiVO as a whole, are distributed under the *GPLv3 license*.

You may also check the [XiVO blog](#) for more information.

XiVO documentation is also available as a downloadable HTML, EPUB or PDF file. See the [downloads page](#) for a list of available files or use the menu on the lower right.

---

## Table of Contents

---

### 1.1 Introduction

XiVO is a PABX application developed by the [Avencall Group](#) based on several free existant components including Asterisk and our own developments. XiVO provides a solution for enterprises who wish to replace or add telephone services (PABX).

XiVO is free software. Most of its distinctive components, and XiVO as a whole, are distributed under the GPLv3 license.

#### 1.1.1 XiVO History

XiVO was created in 2005 by Proformatique.

[XiVO 1.2](#) was released on February 3, 2012.

### 1.2 Installation

#### 1.2.1 Installing the System

Please refer to the section [Troubleshooting](#) if ever you have errors during the installation.

There are two official ways to install XiVO:

- using the official ISO image
- using a minimal Debian installation and the XiVO installation script

---

**Note:** For other unsupported ways of install XiVO please consult the bottom of the page

---

XiVO can be installed on both virtual (QEMU/KVM, VirtualBox, ...) and physical machines. That said, since Asterisk is sensitive to timing issues, you might get better results by installing XiVO on real hardware.

#### Installing from the ISO image

- Download the ISO image. ([latest version](#)) ([all versions](#))
- Boot from the ISO image, select `Install` and follow the instructions. You must select a locale with charset UTF-8.
- At the end of the installation, you can continue by running the [configuration wizard](#).

## Installing from a minimal Debian installation

XiVO can be installed directly over a **32-bit** or a **64-bit (beta)** Debian Wheezy. When doing so, you are strongly advised to start with a clean and minimal installation of Debian Wheezy. The latest installation image for Debian Wheezy can be found at <https://www.debian.org/releases/wheezy/debian-installer>.

### Requirements

The installed Debian must:

- use the architecture `i386` or `amd64`
- have a default locale with charset UTF-8

---

**Note:** the use of `amd64` debian image is experimental

---

### Installation

Once you have your Debian Wheezy properly installed, download the XiVO installation script:

```
wget http://mirror.xivo.io/fai/xivo-migration/xivo_install_current.sh
```

And run it:

```
bash xivo_install_current.sh
```

---

**Note:** For testing purposes, you can alternatively install the release candidate or development version of XiVO. Beware that there is no guarantee that these versions will work nor upgrade correctly.

To install the release candidate version:

```
bash xivo_install_current.sh -r
```

To install the development version:

```
bash xivo_install_current.sh -d
```

---

At the end of the installation, you can continue by running the *configuration wizard*.

### Unsupported installation methods

Unofficial ways of installing:

- By PXE. More details available on our [XiVO blog](#)

## 1.2.2 Running the Wizard

After the system installation, you must go through the wizard before being able to use your XiVO. Open your browser and enter your server's IP address in the navigation bar. (For example: <http://192.168.1.10>)

### Language

You first have to select the language you want to use for the wizard.

Fig. 1.1: Select the language

## License

You then have to accept the *GPLv3 License* under which XiVO is distributed.

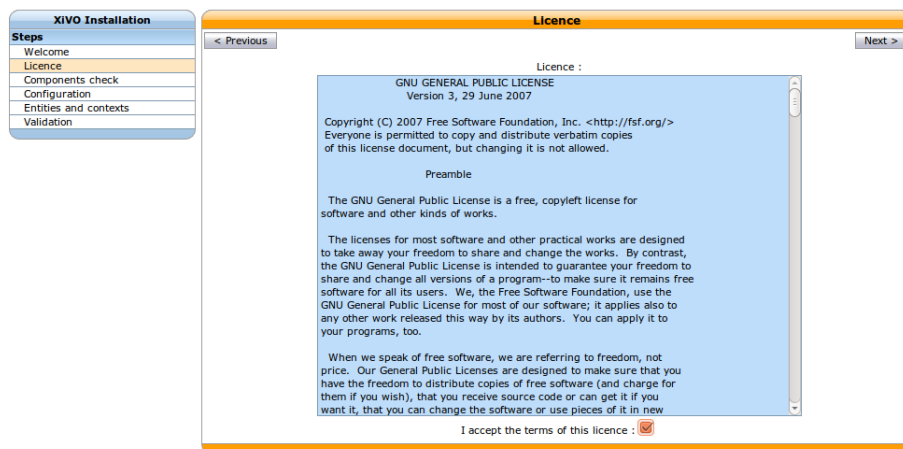

Fig. 1.2: Accept the license

## Configuration

1. Enter the hostname (Allowed characters are : A-Z a-z 0-9 -)
2. Enter the domain name (Allowed characters are : A-Z a-z 0-9 - .)
3. Enter the password for the `root` user of the web interface,
4. Configure the IP address and gateway used by your XiVO (by default it pre-fills the fields with the current IP and gateway of the network interface on which you are connected if the network interface has a default gateway).

---

**Note:** The network configuration will be applied at the end of the wizard

---

5. Finally, modify the DNS server information if needed.

## Entities and Contexts

Contexts are used for managing various phone numbers that are used by your system.

- The Internal calls context manages extension numbers that can be reached internally
- The Incalls context manages calls coming from outside of your system
- The Outcalls context manages calls going from your system to the outside

**XIVO Installation**

**Steps**

- Welcome
- Licence
- Components check

\* Numbers interval end :

**Incalls context**

\* Printed name :  ③

Numbers interval start :

Numbers interval end :

DID length :

**Outcalls context**

\* Printed name :  ④

Fig. 1.4: Entities and Contexts

1. Enter the entity name (e.g. your organization name) (Allowed characters are : A-Z a-z 0-9 - .)
2. Enter the number interval for you internal context. The interval will define the users's phone numbers for your system (you can change it afterwards)
3. Enter the DID range and DID length for your system.
4. You may change the name of your outgoing calls context.

## Validation

Finally, you can validate your configuration by clicking on the `Validate` button. Note that if you want to change one of the settings you can go backwards in the wizard by clicking on the `Previous` button.

**Warning:** This is the last time the `root` password will be displayed. Take care to note it.

Congratulations, you now have a fully functional XiVO server.

You can subscribe to the [xivo-announce list](#) to always stay informed on the latest upgrades for XiVO.

To start configuring XiVO, see [Getting Started](#).

## 1.2.3 Post installation

Here are a few configuration options that are commonly changed once the installation is completed. Please note that these changes are optional.

### Display called name on internal calls

When you call internally another phone of the system you would like your phone to display the name of the called person (instead of the dialed number only). To achieve this you must change the following SIP options:

- *Services* → *IPBX* → *General settings* → *SIP Protocol* → *Default*:
  - Trust the Remote-Party-ID: yes,
  - Send the Remote-Party-ID: select `PAI`

### Incoming caller number display

The display of caller number on incoming calls depends on what is sent by your operator. You can modify it via the file `/etc/xivo/asterisk/xivo_in_callerid.conf`.

**Note:** this is this modified caller id number which will be used in the reverse directory lookup

Examples:

- if you use a prefix to dial outgoing numbers (like a 0) you should add a 0 to all the `add =` sections,
- you may want to display incoming numbers in E.164 format. For example, you can change the `[national1]` section to:

```
callerid = ^0[1-9]\d{8}$
strip = 1
add = +33
```

To enable the changes you have to restart `xivo-agid`:

```
service xivo-agid restart
```

## Time and date

- Configure your locale and default time zone in device template => *Configuration* → *Provisioning* → *Template Device* by editing the default template
- Configure the Timezone in => *Services* → *IPBX* → *General settings* → *Advanced* → *Timezone*
- Reconfigure your timezone for the system:

```
dpkg-reconfigure tzdata
```

## Codecs

You should also select default codecs. It obviously depends on the telco links, the country, the phones, the usage etc. Here is a typical example for Europe (the main goal in this example is to select *only* G.711 A-Law instead of both G.711 A-Law and G.711 μ-Law by default):

- SIP : *Services* → *IPBX* → *General settings* → *SIP Protocol* → *Signaling*:
  - Customize codec : activate,
  - Disable codec : All
  - Codec list:

```
G.711 A-Law
G.722
G.729A
H.264
```

- IAX2 : *Services* → *IPBX* → *General settings* → *IAX Protocol* → *Default*:
  - Customize : activate,
  - Disallowed codec : All
  - Codec list:

```
G.711 A-Law
G.722
G.729A
H.264
```

## 1.3 Getting Started

This section will show you how to create a user with a SIP line. This simple use case covers what a lot of people need to start using a phone. You can use these steps for configuring a phone (e.g a softphone, an Analog-to-Digital switch or a SIP phone).

This tutorial doesn't cover how to automatically provision a *supported device*. For this, consult the *provisioning section*.

We first need to log into the XiVO web interface. The web interface is where you can administer the whole system.

When logged in, you will see a page with all the status information about your system. This page helps you monitor the health of your system and gives you information about your network. Please note the IP address of your server, you will need this information later on when you will configure your device (e.g. phone)

To configure a device for a user, start by navigating to the IPBX menu. Hover over the *Services* tab, a dropdown menu will appear. Click on *IPBX*.

Select the *Users* setting in the left menu.

From here, press on the “plus” sign. A pop up will appear where you can click on *Add*.

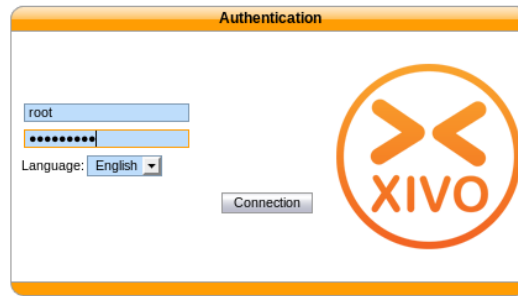

Fig. 1.5: Logging into the XiVO

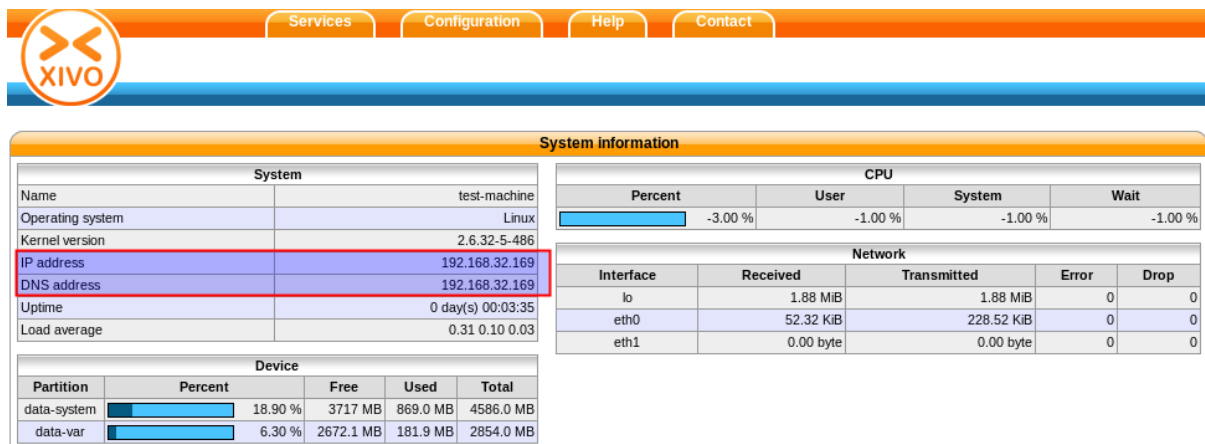

Fig. 1.6: System informations

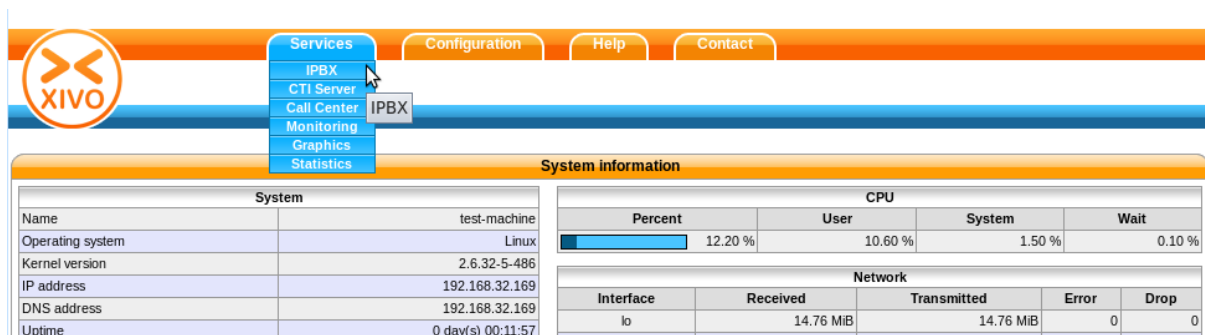

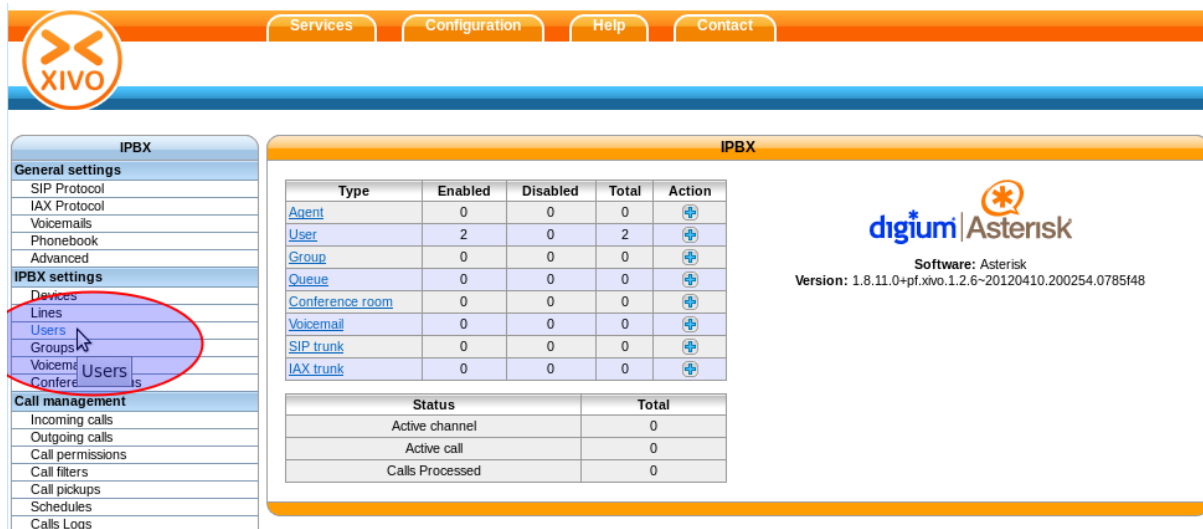

Fig. 1.7: Menu IPBX

The screenshot shows the XiVO IPBX configuration interface. The left sidebar has a menu with 'Users' highlighted. The main content area is titled 'IPBX' and contains a table of user types and their counts.

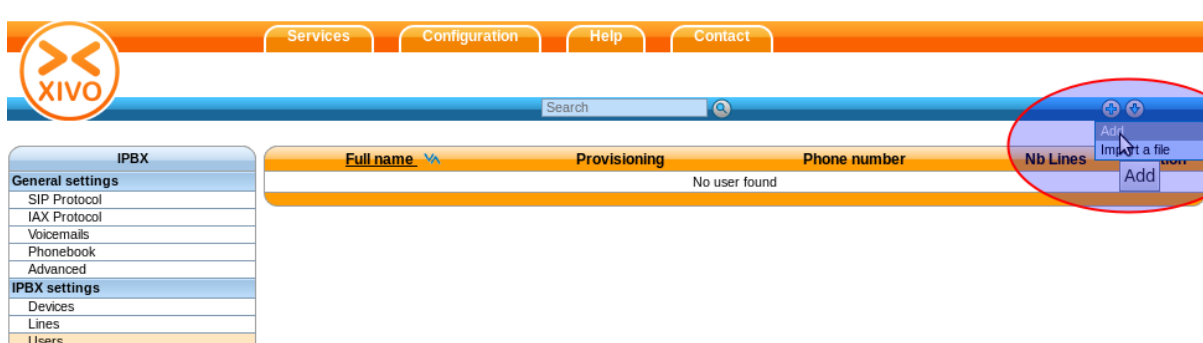

Type	Enabled	Disabled	Total	Action
<a href="#">Agent</a>	0	0	0	<a href="#">+</a>
<a href="#">User</a>	2	0	2	<a href="#">+</a>
<a href="#">Group</a>	0	0	0	<a href="#">+</a>
<a href="#">Queue</a>	0	0	0	<a href="#">+</a>
<a href="#">Conference room</a>	0	0	0	<a href="#">+</a>
<a href="#">Voicemail</a>	0	0	0	<a href="#">+</a>
<a href="#">SIP trunk</a>	0	0	0	<a href="#">+</a>
<a href="#">IAX trunk</a>	0	0	0	<a href="#">+</a>

Below the table, there is a summary table:

Status	Total
Active channel	0
Active call	0
Calls Processed	0

On the right side of the main content area, there is a Digium Asterisk logo and version information: Software: Asterisk, Version: 1.8.11.0+pf.xivo.1.2.6-20120410.200254.0785f48.

Fig. 1.8: Users settings

The screenshot shows the XiVO IPBX configuration interface. The left sidebar has a menu with 'Users' highlighted. The main content area is titled 'IPBX' and contains a table of user types and their counts.

Full name	Provisioning	Phone number	Nb Lines
No user found			

On the right side of the main content area, there is a Digium Asterisk logo and version information: Software: Asterisk, Version: 1.8.11.0+pf.xivo.1.2.6-20120410.200254.0785f48.

Fig. 1.9: Adding a new line

We now have the form that will allow us to create a new user. The three most important fields are ‘First name’, ‘Last name’ and ‘Language’. Fill in the fields and click on *Save* at the bottom. For our example, we will create a user called ‘Alice Wonderland’.

The screenshot shows the 'Users > Add' form in the XiVO web interface. The 'General' tab is active. The following fields are visible and highlighted with red circles:

- First name: Alice
- Last name: Wonderland
- Language: en\_US

Other fields include 'User picture' (with a 'Browse...' button), 'Mobile phone number', 'Ringing time' (30 seconds), 'Simultaneous calls' (5), 'On-Hold Music' (default), 'Timezone', 'Caller ID' (Alice Wonderland), 'Outgoing Caller ID' (Default), 'Preprocess subroutine', and 'User field'. A 'Save' button is located at the bottom of the form.

Fig. 1.10: User information

Afterwards, click on the “Lines” tab.

The screenshot shows the 'Users > Add' form in the XiVO web interface, with the 'Lines' tab selected. The 'Lines' tab is highlighted with a red circle. The 'Entity' dropdown is set to 'machine-test'. A table with columns 'Protocol', 'Name', 'Context', 'Number', 'Site', 'Device', and 'Line (N°)' is shown, with a 'No line' message. A 'Save' button is located at the bottom of the form.

Fig. 1.11: Lines menu

Enter a number for your phone. If you click inside the field, you will see the range of numbers you can use. For our example, we will use ‘1000’.

By default, the selected protocol is SIP, which is what we want for now. Click on *Save* to create the line.

We now have a user named ‘Alice Wonderland’ with the phone number ‘1000’.

**Users > Add**

Entity: machine-test

	Protocol	Name	Context	Number	Site	Device	Line (N°)
1	SIP		Default	1000 - 1500	local		1

Save

Fig. 1.12: Line information

**Users > Add**

Entity: machine-test

	Protocol	Name	Context	Number	Site	Device	Line (N°)
1	SIP		Default	1000	local		1

Save

Fig. 1.13: Save

**Users**

	Full name	Provisioning	Phone number	Nb Lines	Action
<input type="checkbox"/>	Alice Wonderland	104962	1000	1	

Alice Wonderland

Fig. 1.14: User added information

Now we need to go get the SIP username and password to configure our phone. Go back to the IPBX menu on the left, and click on 'Lines'.

Fig. 1.15: Lines information

You will see a line associated with the user we just created. Click on the pencil icon to edit the line.

Fig. 1.16: Edit line

We can now see the username and password for the SIP line. you can configure your phone using the IP for your server, the username and the password.

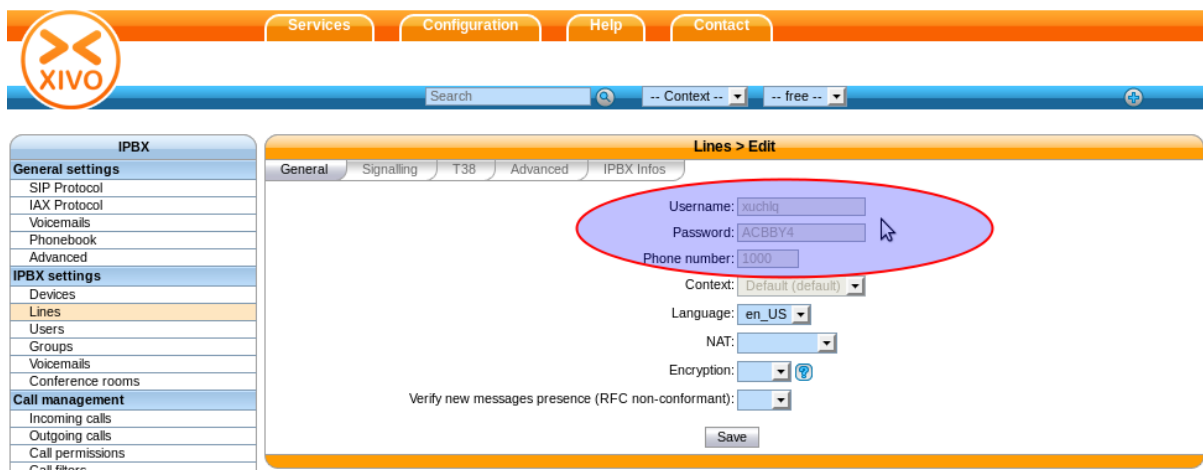

Fig. 1.17: General line information

## 1.4 Upgrading

Upgrading a XiVO is done by executing commands through a terminal on the server. You can connect to the server either through SSH or with a physical console.

To upgrade your XiVO to the latest version, you **must** use the *xivo-upgrade* script. You can start an upgrade with the command:

```
xivo-upgrade
```

### Note:

- You can't use xivo-upgrade if you have not run the wizard yet
- Upgrading from a version prior to XiVO 1.2 is not supported.
- When upgrading XiVO, you **must** also upgrade **all** associated XiVO Clients. There is currently no retro-compatibility on older XiVO Client versions.

This script will update XiVO and restart all services.

There are 2 options you can pass to xivo-upgrade:

- `-d` to only download packages without installing them. **This will still upgrade the package containing xivo-upgrade and xivo-service.**
- `-f` to force upgrade, without asking for user confirmation

**Warning:** If xivo-upgrade fails or aborts in mid-process, the system might end up in a faulty condition. If in doubt, run the following command to check the current state of xivo's firewall rules:

```
iptables -nvL
```

If, among others, it displays something like the following line (notice the DROP and 5060)

```
0      0 DROP      udp  --  *      *      0.0.0.0/0      0.0.0.0/0
```

```
udp dpt:5060
```

Then your XiVO will not be able to register any SIP phones. In this case, you must delete the DROP rules with the following command:

```
iptables -D INPUT -p udp --dport 5060 -j DROP
```

Repeat this command until no more unwanted rules are left.

### 1.4.1 Preparing for an Upgrade

- Consult the [roadmaps](#) starting from your current version to the current prod version.
- Read all existing Upgrade Notes (see below) starting from your version to the current prod version.
- For custom setups, follow the required procedures described below (example : cluster).
- To download the packages beforehand, run `xivo-upgrade -d`. This is not necessary, but useful for upgrading more quickly prior to stopping telephone services.
- When ready, run `xivo-upgrade` which will start the upgrade process. **Telephone services will be stopped during the process**
- When finished, check that the services are running :
- with `xivo-service status` command,

- and with actual checks like SIP registration, ISDN links status, internal/incoming/outgoing calls, XiVO Client connections etc.

### 1.4.2 Upgrading from XiVO 14.01, 14.02, 14.03, 14.04 installed from the ISO

In those versions, xivo-upgrade keeps XiVO on the same version. You must do the following, before the normal upgrade:

```
echo "deb http://mirror.xivo.io/debian/ xivo-five main" > /etc/apt/sources.list.d/xivo-upgrade.li
&& apt-get update \
&& apt-get install xivo-fai \
&& rm /etc/apt/sources.list.d/xivo-upgrade.list \
&& apt-get update
```

### 1.4.3 Upgrading from XiVO 13.03 and before

When upgrading from XiVO 13.03 or earlier, you must do the following, before the normal upgrade:

```
wget http://mirror.xivo.io/xivo_current.key -O - | apt-key add -
```

### 1.4.4 Upgrading from XiVO 12.13 and before

When upgrading from XiVO 12.13 or earlier, you must do the following, before the normal upgrade:

```
apt-get update
apt-get install debian-archive-keyring
```

### 1.4.5 Upgrading from XiVO 1.2.1 and before

Upgrading from 1.2.0 or 1.2.1 requires a special procedure before executing xivo-upgrade:

```
apt-get update
apt-get install xivo-upgrade
/usr/bin/xivo-upgrade
```

### 1.4.6 Upgrading a Cluster

Here are the steps for upgrading a cluster:

1. On the master : deactivate the database replication by commenting the cron in /etc/cron.d/xivo-ha-master
2. On the slave, deactivate the xivo-check-master-status script cronjob by commenting the line in /etc/cron.d/xivo-ha-slave
3. On the slave, start the upgrade:

```
xivo-slave:~$ xivo-upgrade
```

4. When the slave has finished, start the upgrade on the master:

```
xivo-master:~$ xivo-upgrade
```

5. When done, launch the database replication manually:

```
xivo-master:~$ xivo-master-slave-db-replication <slave ip>
```

6. Reactivate the cronjobs (see steps 1 and 2)

## 1.4.7 Upgrading to/from an archive version

### Upgrade involving archive version of XiVO

#### Introduction

**What is an archive version?** An archive version refers to a XiVO installation whose version is frozen: you can't upgrade it until you manually change the upgrade server.

**What is the point?** Using archive versions enable you to upgrade your XiVO to a specific version, in case you don't want to upgrade to the latest (which is not recommended, but sometimes necessary). You will then be able to upgrade your newer archive version to the latest version or to an even newer archive version.

#### Archive package names

Archive packages are named as follow:

XiVO version	Archive package name
1.2 to 1.2.12	pf-fai-xivo-1.2-skaro-1.2.1
12.14 to 13.24	xivo-fai-skaro-13.04
13.25 to 14.17	xivo-fai-14.06

#### Upgrade from an archive to the latest version

Archive version < 13.25:

```
apt-get update
apt-get install {xivo-fai,xivo-fai-skaro}/squeeze-xivo-skaro-$(cat /usr/share/xivo/XIVO-VERSION)
xivo-upgrade
```

Archive version >= 13.25 and < 14.18:

```
apt-get update
apt-get install xivo-fai
xivo-upgrade
```

Archive version >= 14.18:

```
xivo-dist xivo-five
xivo-upgrade
```

As a result, xivo-upgrade will upgrade XiVO to the latest stable version.

#### Upgrade from an older non-archive version to a newer archive version

Non-archive version means any “normal” way of installing XiVO (ISO install, script install over pre-installed Debian, xivo-upgrade).

Downgrades are not supported: you can only upgrade to a greater version.

We only support upgrades to archive versions >= 13.25, e.g. you can upgrade a 12.16 to 14.16, but not 12.16 to 13.16

#### Current version before 14.18 (here 13.25)

```
apt-get install xivo-fai-13.25
```

You are now considered in an archived version, see the section *Upgrade from an older archive version to a newer archive version* below.

**Current version after 14.18**

```
xivo-dist xivo-15.12
apt-get update
apt-get install xivo-upgrade/xivo-15.12
xivo-upgrade
```

**Upgrade from an older archive version to a newer archive version**

Downgrades are not supported: you can only upgrade to a greater version.

We only support upgrades to archive versions  $\geq 13.25$ , e.g. you can upgrade a 12.16 to 14.16, but not 12.16 to 13.16

**Current archive version between 1.2 and 13.24 (here 1.2.3 to 14.16)**

```
cat > /etc/apt/preferences.d/50-xivo-14.16.pref <<EOF
Package: *
Pin: release a=xivo-14.16
Pin-Priority: 700
EOF

apt-get update
apt-get install {xivo-fai,xivo-fai-skaro}/squeeze-xivo-skaro-1.2.3
apt-get update
apt-get install xivo-fai-14.16
apt-get update
apt-get install xivo-upgrade/xivo-14.16
xivo-upgrade
rm /etc/apt/preferences.d/50-xivo-14.16.pref
apt-get update
```

**Current archive version after 13.25 (here 13.25 to 14.16)**

```
cat > /etc/apt/preferences.d/50-xivo-14.16.pref <<EOF
Package: *
Pin: release a=xivo-14.16
Pin-Priority: 700
EOF

apt-get update
apt-get install xivo-fai
apt-get purge xivo-fai-13.25
apt-get update
apt-get install xivo-fai-14.16
apt-get update
apt-get install xivo-upgrade/xivo-14.16
xivo-upgrade
rm /etc/apt/preferences.d/50-xivo-14.16.pref
```

**Current archive version after 14.18**

```
xivo-dist xivo-15.12
apt-get update
apt-get install xivo-upgrade/xivo-15.12
xivo-upgrade
```

## 1.4.8 Upgrade Notes

### 15.12

- Consult the [15.12 Roadmap](#)
- The certificate used for HTTPS in the web interface will be regenerated if the default certificate was used. Your browser will complain about the new certificate, and it is safe to accept it (see [#3656](#)). See also [HTTPS certificate](#).
- If you have an [HA configuration](#), then you should run `xivo-sync -i` on the master node to setup file synchronization between the master and the slave. File synchronization will then be done automatically every hour via rsync and ssh.
- `xivo-auth` and `xivo-dird` now use HTTPS, if you have custom development using these services, update your configuration accordingly.

### 15.11

- Consult the [15.11 Roadmap](#)
- The call records older than 365 days will be periodically removed. The first automatic purge will occur in the night after the upgrade. See [Purge Logs](#) for more details.

### 15.10

- Consult the [15.10 Roadmap](#)

### 15.09

- Consult the [15.09 Roadmap](#)

### 15.08

- Consult the [15.08 Roadmap](#)
- The Dialer Xlet has been integrated in Identity Xlet.

### 15.07

- Consult the [15.07 Roadmap](#)

### 15.06

- Consult the [15.06 Roadmap](#)
- The `provd` client has been moved into a new python package, `xivo_provd_client`. If you have custom scripts using this client, you'll need to update them. See <http://projects.xivo.io/issues/5469> for more information.
- The `provd_pycli` command name has been deprecated in favor of `xivo-provd-cli`. These 2 commands do the same thing, the only difference being the name of the command. The `provd_pycli` command name will be removed in 15.10, so if you have custom scripts referencing `provd_pycli`, you'll need to update them.
- The `xivo-agentctl` command name has been deprecated in favor of `xivo-agentd-cli`. These 2 commands do the same thing, the only difference being the name of the command. The `xivo-agentctl` command name will be removed in 15.10, so if you have custom scripts referencing `xivo-agentctl`, you'll need to update them.

## 15.05

- Consult the [15.05 Roadmap](#)
- The Xlet identity has been modified to follow the new XiVO Client design which implies the removal of some details.

## 15.04

- Consult the [15.04 Roadmap](#)

## 15.03

- Consult the [15.03 Roadmap](#)

## 15.02

- Consult the [15.02 Roadmap](#)

## 15.01

- Consult the [15.01 Roadmap](#)
- The *confd REST API* is now more restrictive on HTTP headers. Particularly, the headers Accept and Content-Type must be set to (typically) application/json.
- The following configuration files have been created:
  - /etc/xivo-agid/config.yml
  - /etc/xivo-call-logd/config.yml
  - /etc/xivo-amid/config.yml
  - /etc/xivo-agentd/config.yml

## Archives

### Archived Upgrade Notes

## 2014

### 14.24

- Consult the [14.24 Roadmap](#)

The following security vulnerability has been fixed:

- **XIVO-2014-01**: Queues and groups permit callers to make unwanted calls

### 14.23

- Consult the [14.23 Roadmap](#)
- The “waiting calls / logged agents ratio” *queue diversion scenario* has been renamed to “number of waiting calls per logged agents”.
- A new *community* section was added to the official documentation for all user-contributed documentation.

## 14.22

- Consult the [14.22 Roadmap](#)
- The sheet event *Dial* on queues is now only sent to the ringing agent. The sheet is also sent a little later during the call, when the ringing agent is known.

## 14.21

- Consult the [14.21 Roadmap](#)
- The *confd REST API* is now accessible via HTTPS on port 9486 and via HTTP on port 9487 (localhost only). These ports are replacing the 50051 and 50050 ports respectively. It will still be possible to access the confd REST API via the 50051 and 50050 ports for the next year, but you are advised to update your confd REST API clients as soon as possible.
- The old (unsupported) ami-proxy is now replaced by an ami-proxy built in xivo-ctid. You must **uninstall the old ami-proxy** before activating the built-in version. See [troubleshooting xivo-ctid](#) to learn how to activate.

## 14.20

- Consult the [14.20 Roadmap](#)
- Default parameters for all Cisco SPA ATA plugins have changed to be better suited for european faxes.
- Following the [POODLE attack](#) (CVE-2014-3566), SSL 3.0 has been disabled for the web interface and the xivo-confd REST API.

If you have Aastra phones and are using the remote directory on them, consult the following detailed upgrade notes:

**Aastra Remote Directory Upgrade Notes** Starting from XiVO 14.20, it is not possible anymore to use SSL 3.0 when connecting to XiVO using HTTPS.

This has the unfortunate consequence of breaking the remote directory on Aastra phones configured by the `xivo-aastra` provisioning plugins in version 1.2 and earlier.

**Upgrade procedure** To be able to use the remote directory on your Aastra phones on XiVO 14.20 or later, you'll need to take one of the following actions:

**Upgrade to the Latest Plugin** This is the recommended solution. This can be done either before or after the upgrade. You'll have to:

1. Upgrade your `xivo-aastra` plugin to version 1.3 or later
2. Restart/synchronize all your phones

The correction is only available for plugin `xivo-aastra-3.3.1-SP2` and later. If you are using an older plugin (`xivo-aastra-3.2.2-SP3` for example), then you'll need to install a newer plugin and *update all your phones to use the new plugin*.

If you were already using custom templates, make sure to update them so that the phones access the remote directory via HTTP instead of HTTPS. This can be done using the following command:

```
find /var/lib/xivo-provd/plugins/xivo-aastra* -name '*.tpl' -exec sed -i '/X_xivo_phonebook_ip/s/'
```

**Update the Templates** If you can't or don't want to update to a newer plugin, you can instead update the templates used by the plugin. This can be done either before or after the upgrade. You'll have to:

1. Update the templates so that the directory is accessed via HTTP
2. Restart/synchronize all your phones

In this specific case, it is safe to directly modify the templates used by the plugin instead of *creating custom templates*. To update the templates, you can use the following command:

```
find /var/lib/xivo-provd/plugins/xivo-aastra* -name '*.tpl' -exec sed -i '/X_xivo_phonebook_ip/s/'
```

**Re-enable SSL 3.0** If you can't restart/synchronize your phones, the last solution is to re-enable SSL 3.0 on your XiVO. This should only be used as a temporary solution to give you more time to plan a firmware upgrade for your phones. This can be done only after the upgrade. You'll have to:

1. Update nginx configuration
2. Reload nginx

This can be done using the following commands:

```
sed -i 's/ssl_protocols .*/ssl_protocols SSLv3 TLSv1 TLSv1.1 TLSv1.2;/' /etc/nginx/sites-available/
service nginx reload
```

## 14.19

- Consult the [14.19 Roadmap](#)

## 14.18

- Consult the [14.18 Roadmap](#)
- xivo-fai packages were replaced with xivo-dist : a new tool to handle repositories sources. Upon upgrade, xivo-dist is installed and run and all xivo-fai packages are purged. *Consult [xivo-dist use cases](#)*

## 14.17

- Consult the [14.17 Roadmap](#)
- DAHDI configuration file `/etc/dahdi/modules` is no more created by default and must now be maintained manually. No action is needed upon upgrade but be aware that the upstream sample file is now available in `/usr/share/dahdi/modules.sample`. See *[dahdi modules documentation](#)* for detailed info.
- The new *CCSS feature* will not be enabled upon upgrade, you must explicitly enable it in the *IPBX* → *IPBX Services* → *Extensions* menu.

## 14.16

- Consult the [14.16 Roadmap](#)
- See the *[changelog](#)* for xivo-confd's REST API
- DAHDI is upgraded to 2.10.0. If the upgrade process asks about `/etc/dahdi/modules`, we recommend that you keep the old version of the file.
- Asterisk now inserts CEL and queue log entries via the ODBC asterisk modules instead of the pgsql modules.

## 14.15

- Consult the [14.15 Roadmap](#)
- Duplicate function keys will be deleted upon upgrade. If multiple function keys pointing to the same destination are detected for a given user, only the one with the lowest position will be kept. To see the list of deleted function keys, check the xivo-upgrade log file such as:

```
grep MIGRATE_FK /var/log/xivo-upgrade.log
```

**DAHDI 2.9.2 Upgrade Notes** These notes only apply to:

- Digium TE133/TE131 cards that are in firmware version 780017 or earlier
- Digium TE435/TE235 cards that are in firmware version e0017 or ealier

**Warning:** The system will need to be power cycled after the upgrade. Your cards will not be usable until then.

**After the upgrade** First, you need to install the latest firmware for your TE133/TE131 or TE435/TE235 cards:

```
xivo-fetchfw install digium-te133
xivo-fetchfw install digium-te435
```

Then stop all the services and reload the DAHDI modules. Reloading the DAHDI module might take up to 30 seconds:

```
xivo-service stop
service dahdi stop
service dahdi start
```

Following this manipulation, you should see something similar at the end of the `/var/log/messages` file:

```
dahdi: Telephony Interface Unloaded
dahdi: Version: 2.9.2
dahdi: Telephony Interface Registered on major 196
wctel3xp 0000:03:0c.0: Firmware version 780017 is running, but we require version 780019.
wctel3xp 0000:03:0c.0: firmware: agent loaded dahdi-fw-te133.bin into memory
wctel3xp 0000:03:0c.0: Found dahdi-fw-te133.bin (version: 780019) Preparing for flash
wctel3xp 0000:03:0c.0: Uploading dahdi-fw-te133.bin. This can take up to 30 seconds.
wctel3xp 0000:03:0c.0: Delaying reset. Firmware load requires a power cycle
wctel3xp 0000:03:0c.0: Running firmware version: 780017
wctel3xp 0000:03:0c.0: Loaded firmware version: 780019 (Will load after next power cycle)
wctel3xp 0000:03:0c.0: FALC version: 5
wctel3xp 0000:03:0c.0: Setting up global serial parameters for T1
wctel3xp 0000:03:0c.0: VPM450: firmware dahdi-fw-oct6114-032.bin not available from userspace
```

For the firmware update to complete, you **must halt** the machine (a reboot won't be enough) before restarting it.

## 14.14

- Consult the [14.14 Roadmap](#)
- See the [changelog](#) for REST API
- Upon an important freeze of Asterisk, Asterisk will be restarted. See the [associated ticket](#) for more information.

## 14.13

- Consult the [14.13 Roadmap](#)
- See the [changelog](#) for REST API
- Skills-based routing: for an agent which doesn't have the skill X, the rule  $X < 10$  was previously evaluated to true, since not having the skill X was equivalent to having it with a value of 0. This behaviour has changed, and the same expression is now evaluated to false. If you are using skills-based routing, you'll need to check that your rules are still doing what you expect. See [skill evaluation](#) for more information.

## 14.12

- Consult the [14.12 Roadmap](#)
- All provisioning plugins were modified. Although not mandatory, it is strongly advised to update all used plugins.
- The function key ‘Activate voicemail’ was removed as it was a duplicate of existing function key ‘Enable voicemail’. All users having the ‘Activate voicemail’ function key will have to be reconfigured with a ‘Enable voicemail’ function key in order to keep the equivalent feature.
- Log files have changed for the following daemons (previously in `/var/log/daemon.log`):
  - xivo-provd: `/var/log/xivo-provd.log`
  - xivo-agid: `/var/log/xivo-agid.log`
  - xivo-sysconfd: `/var/log/xivo-sysconfd.log`

## 14.11

- Consult the [14.11 Roadmap](#)
- The API URL `/lines/<id>/extension` is now deprecated. Use `/lines/<id>/extensions` instead.

## 14.10

- Consult the [14.10 Roadmap](#)
- Custom MOH have been [fixed](#), but can not be used for playing uploaded files anymore. See [Music on Hold](#).

## 14.09

- Consult the [14.09 Roadmap](#)
- REST API 1.0 is no more. All code, tests and documentation was removed from XiVO. All code developed for REST API 1.0 must now be adapted to use REST API 1.1.

## 14.08

- Consult the [14.08 Roadmap](#)
- The `xivo` database has been merged into the `asterisk` database. The database schema has also been altered in a way that it might make the upgrade longer than usual.

Please consult the following detailed updated notes for more information:

**Databases Merge Upgrade Notes** The `xivo` database has been merged into the `asterisk` database in XiVO 14.08. This has an impact on:

- The [restore](#) procedure. There’s only one database to restore now. Also, the procedure to restore the data while keeping the system configuration has been updated.
- The data that is replicated between the master and the slave in a [high availability](#) cluster.

Previously, all the configuration that was under the “Configuration” menu of the web interface was not replicated between the master and slave. This is now replicated, except for:

- HA settings
- All the network configuration (i.e. everything under the *Configuration* → *Network* section)
- All the support configuration (i.e. everything under the *Configuration* → *Support* section)

The call center statistics have also been excluded from the replication.

The way the replication is done has also been updated, which makes it faster.

**Optional Upgrade Procedure** When upgrading to XiVO 14.08, the database schema will be altered.

This will result in a longer upgrade time if you have a lots of rows in the queue\_log table.

You can see the number of rows in your queue\_log table with:

```
sudo -u postgres psql -c "SELECT count(*) FROM queue_log" asterisk
```

On ordinary hardware, you can expect that it will take ~10 minutes for every 2.5 million of rows. So if you have 5 million of rows in your queue\_log table, you can expect that the upgrade will take an extra 20 minutes.

It is possible to reduce the amount of additional time the upgrade will take by either removing rows from the table or altering the table before the upgrade.

Both these commands can be run while the XiVO services are up.

For example, if you want to remove all the rows before march 2014, you can use:

```
sudo -u postgres psql -c "DELETE FROM queue_log WHERE \"time\" < '2014-03-01'" asterisk
```

If you want to alter the table before the upgrade, you can use:

```
sudo -u postgres psql -c "ALTER TABLE queue_log ADD COLUMN id SERIAL PRIMARY KEY; GRANT ALL ON SE
```

---

**Note:** It is recommended to execute this command when there's no activity on the system.

---

**More Technical Information** The way the database is initially provisioned and the way it is altered during an upgrade has also been changed.

In XiVO 14.07 and earlier, the database was provisioned by executing the /usr/share/xivo-manage-db/datastorage/asterisk.sql SQL script. Starting with XiVO 14.08, the xivo-init-db is responsible for provisioning the database. This script should not be used by an administrator in normal circumstance.

Starting with XiVO 14.08, database migration are done with the help of [alembic](#) instead of the asterisk-XXX.sql and xivo-XXX.sql scripts. The alembic migration scripts can be found inside the /usr/share/xivo-manage-db directory.

Otherwise, the xivo-check-db and xivo-update-db commands have been updated to work with both the old and the new systems and are still the official way to check the database state and update the database respectively.

## 14.07

- Consult the [14.07 Roadmap](#)
- Configuration for phones used for the switchboard has changed.

Please consult the following detailed updated notes for more information:

**Switchboard Phone Configuration Upgrade Notes** The xivo-aastra-switchboard and xivo-snom-switchboard plugins have been removed and their functionalities are now provided by the generic xivo-aastra and xivo-snom plugins respectively.

The upgrade is not done automatically, so please follow the [Upgrade Procedure](#) section below.

Although you are strongly advised to upgrade your switchboard phone configuration, backwards compatibility with the old system will be maintained.

Note that if you need to install a switchboard for a previous version of XiVO, the old xivo-aastra-switchboard and xivo-snom-switchboard plugins can be found in [the archive repository](#).

**Upgrade Procedure** This procedure should be executed after the upgrade to 14.07 or later: the options used in this procedure are not available in versions before 14.07.

The following upgrade procedure suppose that you are using an Aastra phone as your switchboard phone. The same upgrade procedure apply for Snom phones, with the only difference being the different plugin name.

1. Update the list of installable plugins.
2. Install the latest xivo-aastra plugin, or upgrade it to the latest version if it is already installed.
3. Install the needed language files and firmware files.
4. For each phone used for the switchboard, *change the plugin and activate the switchboard option*:
  - Select the generic xivo-aastra plugin.
  - Check the “switchboard” checkbox.
  - Synchronize the phone.
5. Once this is completed, you can uninstall the xivo-aastra-switchboard plugin.

An unofficial script that automates this procedure is also available on github:

```
cd /tmp
wget --no-check-certificate https://raw.githubusercontent.com/xivo-pbx/xivo-tools/master/scripts/
python migrate_switchboard_1407.py
```

## 14.06

- Consult the [14.06 Roadmap](#)
- The XiVO client now uses Qt 5 instead of Qt 4. There is nothing to be aware of unless you are *building your own version* of it.

## 14.05

- Consult the [14.05 Roadmap](#)
- The *CTI Protocol* has been updated.
- The specification of the ‘answered-rate’ queue statistic has changed to exclude calls on a closed queue
- The switchboard can now choose which incoming call to answer
- The package versions do not necessarily contain the current XiVO version, it may contain older versions. Only the package `xivo` is guaranteed to have the current XiVO version.

Please consult the following detailed updated notes for more information:

**DAHDI 2.9.0 Upgrade Notes** These notes only apply to Digium TE133 or TE134 cards that are in firmware version 770017 or earlier.

**Warning:** The system will need to be power cycled after the upgrade. Your cards will not be usable until then.

**After the upgrade** First, you need to install the latest firmware for your TE133 or TE134 cards:

```
xivo-fetchfw install digium-te133
xivo-fetchfw install digium-te134
```

Then stop all the services and reload the DAHDI modules. Reloading the DAHDI module might take up to 30 seconds:

```
xivo-service stop
service dahdi stop
service dahdi start
```

Following this manipulation, you should see something similar at the end of the `/var/log/messages` file:

```
dahdi: Telephony Interface Unloaded
dahdi: Version: 2.9.0
dahdi: Telephony Interface Registered on major 196
wctel3xp 0000:03:0c.0: Firmware version 6f0017 is running, but we require version 780017.
wctel3xp 0000:03:0c.0: firmware: agent loaded dahdi-fw-tel34.bin into memory
wctel3xp 0000:03:0c.0: Found dahdi-fw-tel34.bin (version: 780017) Preparing for flash
wctel3xp 0000:03:0c.0: Uploading dahdi-fw-tel34.bin. This can take up to 30 seconds.
wctel3xp 0000:03:0c.0: Delaying reset. Firmware load requires a power cycle
wctel3xp 0000:03:0c.0: Running firmware version: 6f0017
wctel3xp 0000:03:0c.0: Loaded firmware version: 780017 (Will load after next power cycle)
wctel3xp 0000:03:0c.0: FALC version: 5
wctel3xp 0000:03:0c.0: Setting up global serial parameters for T1
wctel3xp 0000:03:0c.0: VPM450: firmware dahdi-fw-oct6114-032.bin not available from userspace
wctel3xp 0000:03:0c.0: Found a Wildcard TE132/TE134 (SN: 1TE134F - DF05132600690 - B1 - 20130702)
```

For the firmware update to complete, you **must halt** the machine (a reboot won't be enough) before restarting it.

**SCCP Upgrade Notes** Important modification have been made to the internal structure of the SCCP channel driver, `xivo-libsccp`.

The modifications mostly affect administrators; users are not affected.

Major changes are:

- Improved support for live modifications; no more manual intervention in the asterisk CLI is needed.
- Improved handling of concurrency; crash and deadlock due to concurrency problems should not occur anymore.

**CLI** The following commands have been removed because they were not needed:

- `sccp resync`
- `sccp set directmedia`
- `sccp show lines`
- `sccp update config`

The behavior of the following commands have been changed:

- `module reload chan_sccp` reloads the module configuration, without interrupting the telephony service. A device will only be resetted/restarted if needed, and only once the device is idle. Some changes don't even require the device to be resetted.
- `sccp show config` output format has been changed a little.
- `sccp show devices` only show the connected devices instead of all the devices. This might change in the future. To get a list of all the devices, use `sccp show config`.

**Configuration File** The format of the `sccp.conf` configuration file has been changed. This will only impact you if you are using `xivo-libsccp` without using XiVO.

The format has been changed because the module is now using the ACO module from asterisk, which expect configuration file to have a specific format.

See [sccp.conf.sample](#) for a configuration file example.

**Other** Each SCCP session/connection now use 3 file descriptors instead of 1 previously. On XiVO, the file descriptor limit for the asterisk process is 8192, which means that the increase in used file descriptors should not be a problem, even on a large installation.

#### 14.04

- Consult the [14.04 Roadmap](#)
- Live reload of the configuration can be enabled and disabled using the REST API
- The generation of call logs for unanswered calls from the XiVO client have been improved.

#### 14.03

- Consult the [14.03 Roadmap](#)
- A migration script adds an index on the linkedid field in the cel table. Tests have shown that this operation can last up to 11.5 minutes on a XiVO Corporate with 18 millions CELs. xivo-upgrade will thus be slightly longer.
- Two new daemons are now operationnal, xivo-amid and xivo-call-logd:
  - xivo-amid constantly reads the AMI and sends AMI events to the RabbitMQ bus
  - xivo-call-logd generates call-logs in real time based on AMI LINKEDID\_END events read on the bus
- An increase in load average is expected with the addition of these two new daemons.
- The cron job calling xivo-call-logs now runs once a day at 4:25 instead of every 5 minutes.

#### 14.02

- Consult the [14.02 Roadmap](#)
- PHP Web services has been removed from documentation
- REST API 1.0 Web services has been removed from documentation
- REST API 1.1 User-Line-Extension service is replaced by User-Line and Line-Extension services

#### 14.01

- Consult the [14.01 Roadmap](#)
- The following paths have been renamed:
  - /etc/pf-xivo to /etc/xivo
  - /var/lib/pf-xivo to /var/lib/xivo
  - /usr/share/pf-xivo to /usr/share/xivo

You must update any dialplan or configuration file using these paths

### 2013

#### 13.25

- Consult the [13.25 Roadmap](#)
- Debian has been upgraded from version 6 (Squeeze) to 7 (Wheezy), which is essentially a complete system upgrade.

Please consult the following detailed upgrade notes for more information:

## Debian GNU/Linux Wheezy Upgrade Notes

### Before the upgrade

- The upgrade will take longer than usual, because the whole Debian system will be upgraded
- The system must be restarted after the upgrade, because the Linux kernel will also be upgraded

**LDAPS** In case XiVO is using a LDAP server through SSL/TLS (LDAPS), the documentation instructed you to append the certificate to `/etc/ssl/certs/ca-certificates.crt`. However, this is the wrong way to add a new certificate, because it will be erased by the upgrade.

To keep your certificate installed through the upgrade, you must follow the instructions given in the [LDAP documentation](#).

### After the upgrade

**GRUB (Cloned Virtual Machines only)** GRUB installations on cloned virtual machines may lead to unbootable systems, if not fixed properly before restarting the system. If xivo-upgrade detects your system is in a broken state, it will display a few commands to repair the GRUB installation.

### 13.24

- Consult the [13.24 Roadmap](#)
- Default Quality of Service (QoS) settings have been changed for SCCP. The IP packets containing audio media are now marked with the EF DSCP.

### 13.23

- Consult the [13.23 Roadmap](#)
- The *New call* softkey has been removed from SCCP phones in *connected* state. To start a new call, the user will have to press *Hold* then *New call*. This is the same behavior as a *Call Manager*.
- Some softkeys have been moved on SCCP phones. We tried to keep the keys in the same position at any given time. As an example, the *transfer* key will not become *End call* while transferring a call. Note that this is a work in progress and some models still need some tweaking.

### 13.22

- Consult the [13.22 Roadmap](#)
- PostgreSQL will be upgraded from 9.0 to 9.1. The upgrade of XiVO will take longer than usual, depending on the size of the database. Usually, the database grows with the number of calls processed by XiVO. The upgrade will be stopped if not enough space is available on the XiVO server.

### 13.21

- Consult the [13.21 Roadmap](#)
- It is no more possible to delete a device associated to a line using REST API.

### 13.20

- Consult the [13.20 Roadmap](#)
- xivo-libsccp now supports direct media on wifi phone 7920 and 7921
- xivo-confd now implements a voicemail list

### 13.19

- Since XiVO 13.18 was not released, the 13.19 release contains all developments of both 13.18 and 13.19, therefore please consult both Roadmaps :
- Consult the [13.19 Roadmap](#)
- Consult the [13.18 Roadmap](#)
- Call logs are now generated automatically, incrementally and regularly. Call logs generated before 13.19 will be erased one last time.
- The database was highly modified for everything related to devices : table devicefeatures does not exist anymore and now relies on information from xivo-provd.

### 13.17

- Consult the [13.17 Roadmap](#)
- There is a major change to call logs. They are no longer available as a web report but only as a csv export. See the [call logs documentation](#). Furthermore, call logs are now fetched with the new REST API. See [Call Logs](#).
- Paging group numbers are now exclusively numeric. All non-numeric paging group numbers are converted to their numeric-only equivalent while upgrading to XiVO 13.17 ( \*58 becomes 58, for example).

### 13.16

- Consult the [13.16 Roadmap](#)
- A migration script modifies the user and line related-tables and the way users, lines and extensions are associated. As a consequence of this script, it is not possible any more to associate a user and a line without extensions. Existing associations between users and one or more lines having no extensions will be removed. Users and lines will still exist unassociated.
- The [call logs](#) page is able to display partial results of big queries, instead of displaying a blank page.
- Two new CEL messages are now enabled : LINKEDID\_END and BRIDGE\_UPDATE. Those events will only exist in CEL for calls passed after upgrading to XiVO 13.16.
- The new REST API now makes possible to associate multiple user to a given line and/or extension. There are currently some limitations on how those users and lines can be manipulated using the web interface. Please read the [REST API 1.1 documentation](#) and more precisely the [Associate Line to User](#) section for more information.

### 13.15

- There was no production release of XiVO 13.15. All 13.15 developments are included in the official 13.16 release.

### 13.14

- Consult the [13.14 Roadmap](#)
- The latest Polycom plugin enables the phone lock feature with a default user password of '123'. All Polycom phones used with XiVO also have a default admin password. In order for the phone lock feature to be secure, one should change every phone's admin AND user passwords.
- WebServices for SIP trunks/lines: field nat: value yes changed to force\_rport, comedia
- The database has been updated in order to remove deprecated tables (generalfeatures, extennumbers, exten-hash, cost\_center).

### 13.13

- Consult the [13.13 Roadmap](#)

### 13.12

- Consult the [13.12 Roadmap](#)
- CTI protocol: Modified values of agent availability. Read [CTI Protocol changelog](#)
- Clean-up was made related to the minimization of the XiVO Client. Some visual differences have been observed on Mac OS X that do not affect the XiVO Client in a functional way.

### 13.11

- Consult the [13.11 Roadmap](#)
- Asterisk has been upgraded from version 11.3.0 to 11.4.0

API changes:

- Dialplan variable XIVO\_INTERFACE\_0 is now XIVO\_INTERFACE
- Dialplan variable XIVO\_INTERFACE\_NB and XIVO\_INTERFACE\_COUNT have been removed
- The following fields have been removed from the lines and users web services
  - line\_num
  - roles\_group
  - rules\_order
  - rules\_time
  - rules\_type

### 13.10

- Consult the [13.10 Roadmap](#)

API changes:

- CTI protocol: for messages of class `getlist` and function `updateconfig`, the `config` object/dictionary does not have a `rules_order` key anymore.

### 13.09

- Consult the [13.09 Roadmap](#)
- The *Restart CTI server* link has been moved from *Services* → *CTI Server* → *Control* to *Services* → *IPBX* → *Control*.
- The Agent Status Dashboard has been optimized.
- The Directory xlet can now be used to place call.

### 13.08

- Consult the [13.08 Roadmap](#)
- asterisk has been upgraded from version 1.8.21.0 to 11.3.0, which is a major asterisk upgrade.
- The switchboard's queue now requires the `xivo_subr_switchboard` preprocess subroutine.
- A fix to bug [#4296](#) introduced functional changes due to the order in which sub-contexts are included. Please refer to [ticket](#) for details.

Please consult the following detailed upgrade notes for more information:

**Asterisk 1.8 to 11 Upgrade Notes** Table of modules that were available in the asterisk 1.8 package but that are not available anymore in the asterisk 11 package:

Name	Description	Loaded in AST1.8	Asterisk Status	Replaced By
app_dahdibarge	Barge in on DAHDI channel application	Yes	Deprecated	app_chanspy
app_readfile	Stores output of file into a variable	Yes	Deprecated	func_env (FILE())
app_saycountpl	Say polish counting words	Yes	Deprecated	say.conf
app_setcallerid	Set CallerID Presentation Application	Yes	Deprecated	func_callerid
cdr_sqlite	SQLite CDR Backend	No	Removed	cdr_sqlite3_custom
chan_gtalk	Gtalk Channel Driver	No	Deprecated	chan_motif
chan_jingle	Jingle Channel Driver	No	Deprecated	chan_motif
chan_vpb	Voicetronix API driver	No	Supported	
format_sln16	Raw Signed Linear 16KHz Audio support	Yes	Removed	format_sln
res_ais	SAForum AIS	No	Removed	res_corosync
res_jabber	AJI - Asterisk Jabber Interface	No	Deprecated	res_xmpp

List of modules that were loaded in asterisk 1.8 but that are not loaded anymore in asterisk 11 (see modules.conf):

- res\_calendar.so
- res\_calendar\_caldav.so
- res\_calendar\_ews.so
- res\_calendar\_exchange.so
- res\_calendar\_icalendar.so
- res\_config\_sqlite.so
- res\_stun\_monitor.so

List of debian packages that are not available anymore for asterisk 11:

- asterisk-config
- asterisk-mysql
- asterisk-web-vmail

---

**Note:** These packages were not installed by default for asterisk 1.8.

---

If you are using some custom dialplan or AGIs, it is your responsibility to make sure it still works with asterisk 11. See the [External Links](#) for more information.

**The switchboard's queue preprocess subroutine** The switchboard's queue now uses a preprocess subroutine named *xivo\_subr\_switchboard*. This preprocess subroutine will be associated with all queues named *\_\_switchboard* that have no preprocess subroutine defined before the upgrade.

If your switchboard queue is named anything other than `__switchboard` you should add the preprocess subroutine manually.

If your switchboard queue already has a preprocess subroutine, you should add a `Gosub(xivo_subr_switchboard)` to your preprocess subroutine.

**Warning:** This change is only applied to the switchboard distribution queue, not the queue for calls on hold.

### 13.07

- Consult the [13.07 Roadmap](#)
- Agent Status Dashboard has more features and less limitations. See related [agent status dashboard documentation](#)
- XiVO call centers have no more notion of ‘disabled agents’. All previously disabled agents in web interface will become active agents after upgrading.
- asterisk has been upgraded from version 1.8.20.1 to 1.8.21.0. Please note that in XiVO 13.08, asterisk will be upgraded to version 11.
- DAHDI has been upgraded from version 2.6.1 to 2.6.2.
- libpri has been upgraded from version 1.4.13 to 1.4.14.
- PostgreSQL upgraded from version 9.0.4 to 9.0.13

### 13.06

- Consult the [13.06 Roadmap](#)
- The new Agent Status Dashboard has a few known limitations. See related [dashboard xlet known issues section](#)
- Status Since counter in xlet list of agents has changed behavior to better reflect states of agents in queues as seen by asterisk. See [Ticket #4254](#) for more details.

### 13.05

- Consult the [13.05 Roadmap](#)
- The bug [#4228](#) concerning BS filter only applies to 13.04 servers installed from scratch. Please upgrade to 13.05.
- The order of softkeys on SCCP phones has changed, e.g. the *Bis* button is now at the left.

### 13.04

- Consult the [13.04 Roadmap](#)
- Upgrade procedure for HA Cluster has changed. Refer to [Specific Procedure : Upgrading a Cluster](#).
- Configuration of switchboards has changed. Since the directory xlet can now display any column from the lookup source, a display filter has to be configured and assigned to the `__switchboard_directory` context. Refer to [Directory xlet documenttion](#).
- There is no more context field directly associated with a call filter. Boss and secretary users associated with a call filter must necessarily be in the same context.

### 2012

## 12.24

- Consult the [12.24 Roadmap](#)
- XiVO 12.24 has some limitations mainly affecting the contact center features due to the rewriting of the code handling agents.

Please consult the following detailed upgrade notes for more information:

**Contact Center XiVO 12.24** In order to fix problems related to Asterisk freezing through the `chan_agent` module, XiVO 12.24 implements a new way of managing agents.

**Warning** The contact center XiVO 12.24 does not implement all the features available in 12.22. Therefore, you must not upgrade your XiVO if you depend on these features. These features will be reimplemented in the future starting with version 13.01.

### Missing Features

- Skill-based routing
- Penalties
- Call listening

**Live reload via the web interface** Agents must be logged out for the following operations:

- Adding or removing agents from the queues
- When changing the name of a queue (only the name, not the displayed name)

You can logoff all the agents with the following command:

```
xivo-agentctl -c "logoff all"
```

**Preprocess subroutines** Subroutines on users are currently no longer executed when an agent receives a call from the queue

**High availability (HA)** HA for the contact center is not supported for the moment. When switching from a master to a slave, you must relog all your agents.

**SCCP Devices** The “Available” / “In use” statuses for agents that are logged in do not work for the moment.

### Changes in behavior

**“In use” indicator in the XiVO client** In XiVO 12.22, an agent is seen as “In use” when:

- The agent’s phone is ringing or has answered a call coming only from a queue

In XiVO 12.24:

- The agent’s phone is “In use” no matter where the call comes from

**“Available” indicator in the XiVO client** In XiVO 12.22, an agent is seen as “Available” when:

- The agent is not in pause/wrapup and his phone isn’t ringing/in conversation for a call coming from a queue

In XiVO 12.24:

- The agent is not in pause/wrapup and his phone is in the “idle” state

**“Agent linked” / “Agent unlinked” Events** The “Agent linked” event no longer exists in XiVO 12.24. xivo-upgrade will automatically migrate “Agent linked” / “Agent unlinked” sheets to the “linked” / “unlinked” event.

**“Static” Agent VS “Dynamic” agent in the XiVO client** There is no longer a difference between a “static” or “dynamic” membership. All agent memberships are now considered “static”. Membership changes between the web interface and the XiVO client are now synchronized.

**Updates** Please note that when upgrading, the following actions will take place automatically:

- All agents will be logged off before migrating
- All agents with a “dynamic” membership will be removed from their queues

**Useful links** *CTI server is frozen and won’t come back online*

Another change is in effect beginning with XiVO 12.24: the field `profileclient` in the CSV user import sees its values change.

Old value	New value
client	Client
agent	Agent
switchboard	Switchboard
agentsup	Supervisor
oper	<i>removed</i>
clock	<i>removed</i>

## 1.5 CTI Client

This section describes the CTI Client and its various xlets

### 1.5.1 Getting the XiVO Client

Binaries of the XiVO Client are available on our mirror. ([latest version](#)) ([all versions](#))

**Warning:** The installed version of the XiVO Client must match the XiVO server’s version installation. With our current architecture, there is no way to guarantee that the XiVO server will be retro-compatible with older versions of the XiVO Client. Non-matching XiVO server and XiVO Clients versions will bring inconsistencies.

Choose the version you want and in the right directory, get :

- the `.exe` file for Windows
- the `.deb` file for Ubuntu or Debian (i386 or amd64, depending on your computer)
- the `.dmg` file for Mac OS

For Windows, double-click on the file and follow the instructions. You can also install it silently:

```
xivoclient-14.XX-x86.exe /S
```

For Ubuntu/Debian, double-click on the file or execute the following command:

```
$ gdebi xivoclient-*.deb
```

For Mac OS, double-click on the file and drag-and-drop the inner file on the Application entry of the Finder.

The XiVO Client should then be available in the applications menu of each platform.

## 1.5.2 Connection to the server

To connect to the server using the XiVO client you need a user name, a password and the server's address. Optionally, it is possible to login an agent while connecting to the server. An option is available in the configuration, account to show agent login info.

## 1.5.3 Xlets

Xlets are features of the CTI Client. It is the contraction of XiVO applets.

### Conference Xlet

#### Overview

The conference xlet allow the user to join conferences and view conference room statuses.

#### Usage

The *Conference room list* tab show all available conference rooms configured on the XiVO. The user can click on a conference number to join the conference. When a user joins a conference, his phone will ring and the conference will be joined when the user answers the phone.

When clicking on a conference room a new tab is opened for the selected conference room. The new tab contains information about the members of the conference. The name and number of the member will be displayed when available. Users can also mute and unmute themselves using the microphone icon on the left.

### Contact Xlet

#### Overview

The Contacts XLet lists the people of your company, giving you access to their phone and XiVO Client status.

#### Usage

The "Search" text input allows you to filter the list of people according to their name or phone number. An empty filter displays all contacts found.

If the filter matches some contacts, you can see contact objects. Here's what a contact object looks like :

You can see three informations :

- The person's full name
- A person icon: it displays the status of its XiVO Client. Usually:
  - green means connected
  - gray means disconnected
- A phone icon: it displays the status of the phone of the user, if it has a configured phone. Usually:
  - green means that the phone is activated and hanged up
  - red means that the phone is activated and in communication
  - white means that the phone is not registered, i.e. not functional.

The colors and label of these two statuses may be configured within the XiVO Web interface.

You can interact in several ways with a person object :

XiVO is a unified communication system that connects phones inside an organization with public and mobile telephone networks.

☒ Remember me

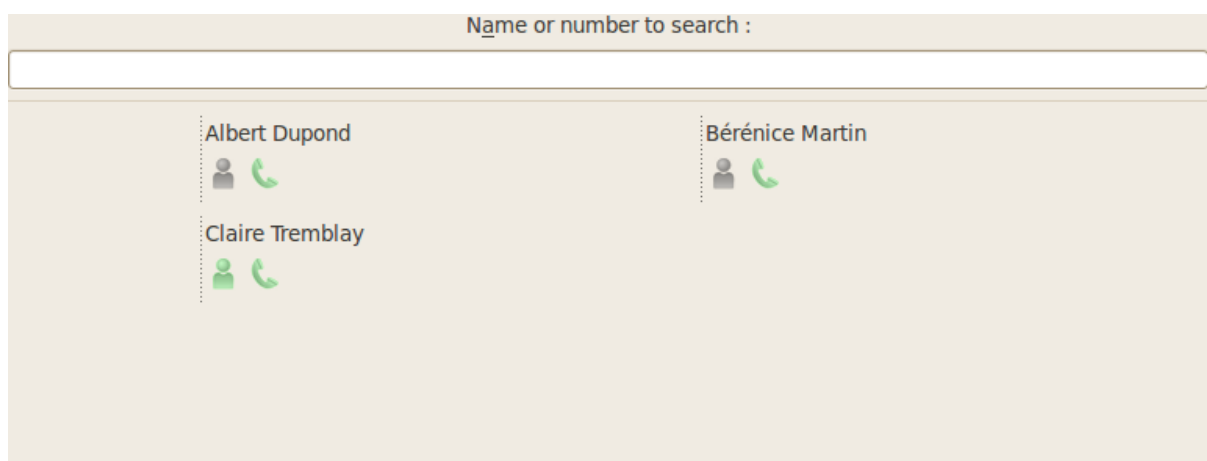

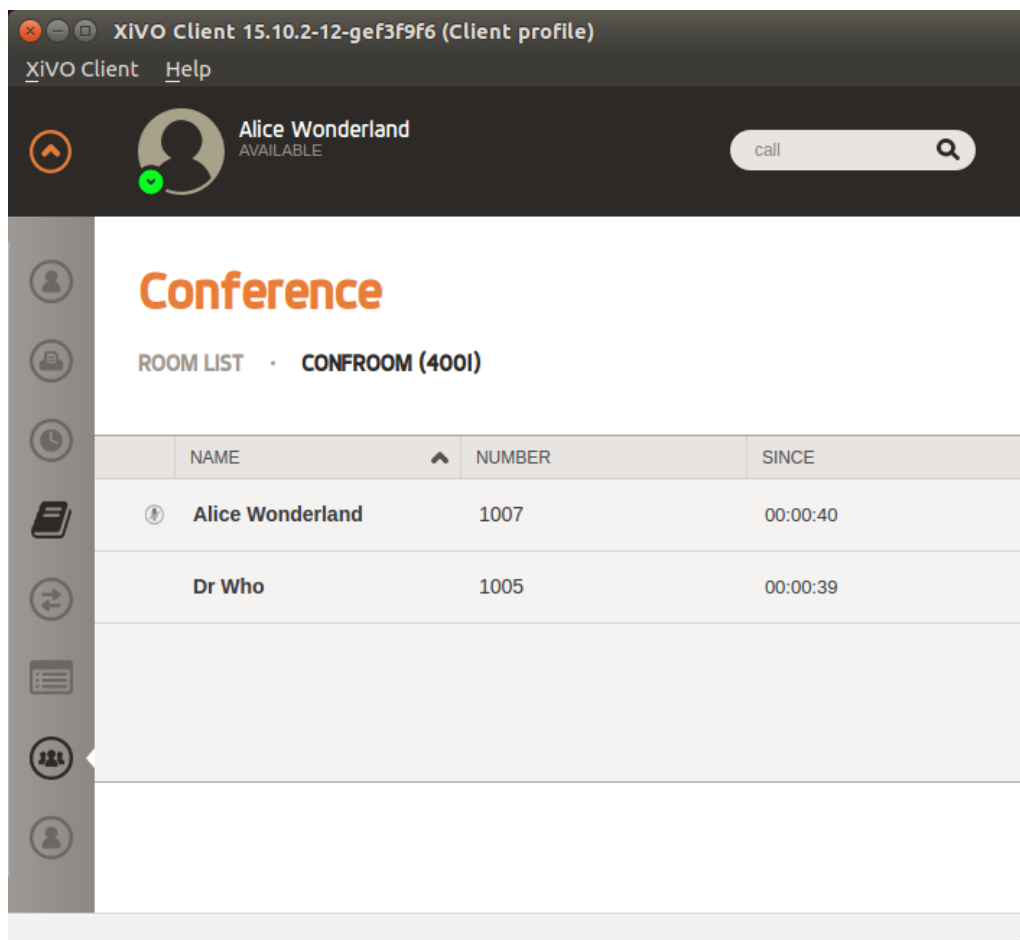

Agent (logged in)

CONNECT

The screenshot shows the XiVO Client application window. The title bar reads "XiVO Client 15.10.2-12-gef3f9f6 (Client profile)". Below the title bar, there is a navigation bar with "XiVO Client" and "Help" links. The main header area displays a user profile for "Alice Wonderland" with a status of "AVAILABLE" and a "call" button. The main content area is titled "Conference" and contains a "ROOM LIST" table. A sidebar on the left contains various icons, with the "Conference" icon (a group of people) highlighted. At the bottom of the window, a status bar indicates "Connected".

NAME	NUMBER	PIN CODE	MEMBER COUNT	STARTED SINCE
confroom	4001	No	2	00:00:29
confroom2	4002	No	0	Not started
confroom3	4003	No	0	Not started
confroom4	4004	No	0	Not started

- Holding your mouse cursor on the person or phone icon will display more details about the person and its phone.
- Double-clicking on it will call the person if its phone is activated
- Right-clicking on it will display the list of possible actions.
- Dragging and dropping it on another person icon will make the dragged user call the dropped user.

Possible actions available through right-click are :

- Call
- Hangup
- Chat
- Intercept call
- Transfer a call to this user
- Cancel a transfer
- Invite to a conference room

The available actions may differ, depending on your current phone situation (available, busy, in a conference room, ...) and on the actions allowed in your CTI profile.

**Configuration** You can modify the display of contacts within the XLet: Go in the menu XiVO Client -> Configure, tab Functions, sub-tab Contacts. You get two options :

- The maximum number of contacts displayed
- The number of columns used to display the contacts. A value of 0 will automatically display the contacts with the maximum number of columns allowed by the width of the window.

**Transfers** Many transfers scenarios are supported from the XiVO contact xlet. Blind and attended transfers can be done by right clicking a contact.

---

**Important:** To be able to transfer calls using the XiVO client you have to enable the transfer service from the user configuration (or the queue configuration if used) form in the web-interface.

---

### Attended Transfers

**Important:** For the Attended Transfer to work properly in all expected cases you must take care of the value of the options below:

*Services --> IPBX --> Services IPBX --> Extensions --> Advanced --> Parking:*

- option *Allow DTMF based transfers when picking up parked call* should be set to `Caller` to be able to initiate an attended transfer for a call picked from a parking,
- option *Allow DTMF based hangups when picking up parked call* should be set to `Caller` to be able to abort an attended transfer picked up from a parking,

---

Usage :

1. Answer an incoming call,
2. Search an user in the Contact xlet,
3. Right clic on the user icon and choose *Attended transfer*,
  - (a) If the selected user has also a mobile, you can choose its mobile,
  - (b) You can abort the attended transfer by dialing \*0 on your phone (see note below),

(c) You can finish the attended transfer by hanging up the call,

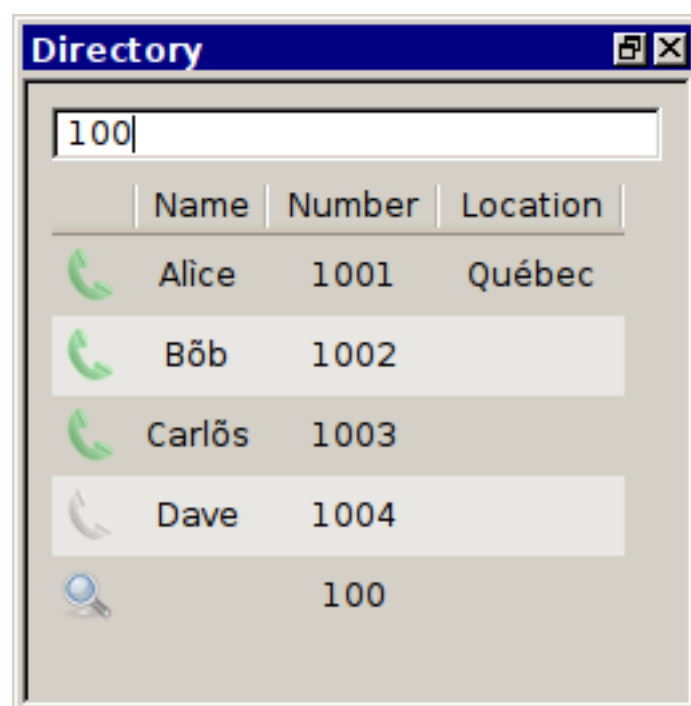

Other important options to look to are :

- *Services* → *IPBX* → *Services IPBX* → *Extensions* → *General* → *Transfers* : option *Timeout for answer on attended transfer* should be set to a value below the mean ringing time of most users on the XiVO if you want the attended transfer be aborted automatically after this timeout,
- *Services* → *IPBX* → *Services IPBX* → *Extensions* → *General* : the option *Hangup* must be set to \*0 if you want to use \*0 to abort attended transfer.

## Directory

### Overview

The goal of the directory xlet is to allow the user to search through XiVO users, directory entries and arbitrary numbers to be able to transfer calls to these destinations.

### Usage

The list of entries in the xlet is searched using the top field. Entries are filtered by column content. The entry list will initially appear as empty.

If the current search term is a valid number, it will be displayed in the result list with no name to allow transfer to numbers that are not currently in the phonebook or configured on the XiVO.

### Legend

- Users available

- Users ringing

- Users talking 
- Users 
- Mobile phone 
- External contacts 
- Current search (not a contact) 

### Known issues

Typing enter while the focus is on a directory entry will have the same behavior as clicking on the transfer button on the *Switchboard* xlet.

This unexpected behavior will be fixed when we implement other actions to the directory xlet.

### Phonebook

Phonebook searches are triggered after the user has entered 3 characters. Results from remote directories will appear after 1 second.

If a directory entry has the same number as a mobile or a phone configured on the XiVO, its extra columns will be added to the corresponding entry instead of creating a new line in the search result.

For example:

If *User 1* has number *1000* and is also in a configured LDAP with a location in “Québec”, if the display filter contains the *Location* column, the entry for *User 1* will show “Québec” in the *Location* column after the search results are received.

### Configuration

**Context** The directory xlet needs a special context named `__switchboard_directory`. In *Services* → *IPBX* → *IPBX configuration* → *Contexts* add a new context with the following parameters :

- Name : `__switchboard_directory`
- Type of context : **Other**
- Display name : Switchboard

Name	Displayed name	Context type	Entity	Action
<input type="checkbox"/> > default	default	Internal	pcm-dev (pcm-dev)	
<input type="checkbox"/> > from-extern	Incalls	Incall	pcm-dev (pcm-dev)	
<input type="checkbox"/> > invalid	invalid	Incall	pcm-dev (pcm-dev)	 
<input type="checkbox"/> > pcm-dev	pcm-dev	Internal	pcm-dev (pcm-dev)	
<input type="checkbox"/> > statscenter	statscenter	Internal	pcm-dev (pcm-dev)	
<input type="checkbox"/> > <b>__switchboard_directory</b>	<b>Switchboard</b>	<b>Other</b>	pcm-dev (pcm-dev)	 
<input type="checkbox"/> > to-extern	Outcalls	Outcall	pcm-dev (pcm-dev)	

**Update displays**

Name:

Available display formats : {db-phone} {db-firstname} {db-lastname} {db-fullname} {db-company} {db-mail}

Field title	Field type	Default value	Display format	
<input type="text" value=""/>	<input type="text" value="status"/>	<input type="text" value=""/>	<input type="text" value=""/>	
Name	name	<input type="text" value=""/>	{db-name}	
Number	number_office	<input type="text" value=""/>	{db-number}	
Number	number_mobile	<input type="text" value=""/>	{db-mobile}	
Location	<input type="text" value=""/>	<input type="text" value=""/>	{db-location}	

Description

**Display filter** A new display filter must be created for the directory xlet.

The following fields must be configured with the correct value for the *Field type* column in order for entries to be displayed in the xlet:

1. *status* is the column that will be used to display the status icon, the title can be empty
2. *name* is displayed in the *Name* column of the xlet
3. *number\_office* is displayed in the *Number* column with a phone icon in the xlet
4. *number\_mobile* is displayed in the *Number* column with a mobile icon in the xlet
5. *number\_...* any other field starting with *number\_* will be displayed in the *Number* column of the xlet with a generic directory icon
6. Any other field will be displayed in their own column of the directory xlet

The values in the *Display format* column must contain values that were created in the *Directory definition*.

The title used for the *Number* column is the title of the first field whose type starts with *number\_*.

---

**Note:** The field title of the first number column will be used for the header title in the xlet.

---

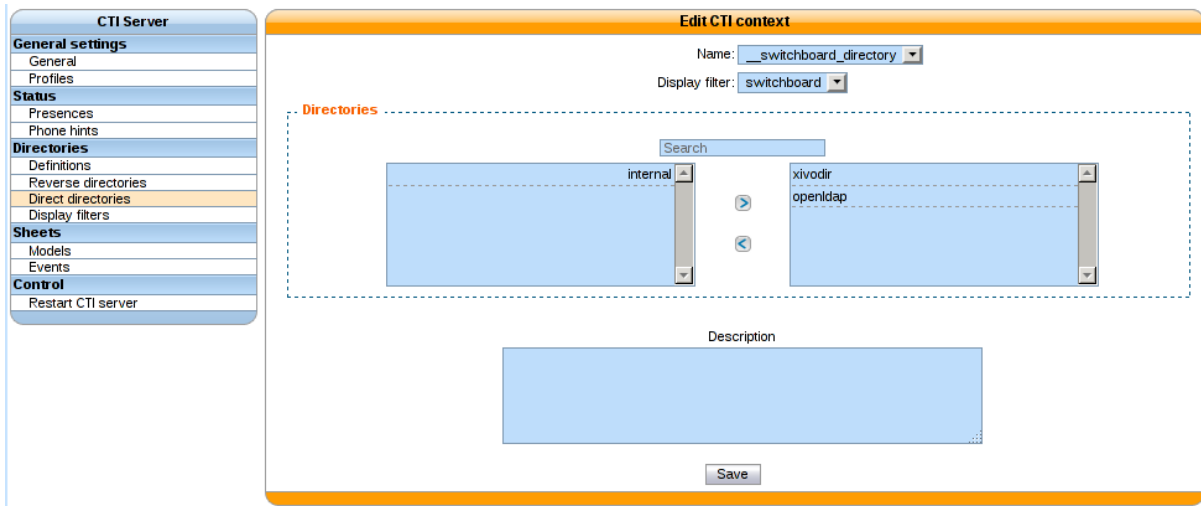

**Warning:** Make sure that the fields entered in the display format are also available in the directory definition, otherwise the filter will not return any results

**Context and filter association** The new *Display filter* has to be assigned to the *\_\_switchboard\_directory* context

You can then choose which directories will be searched by the Xlet.

**Warning:** You must **not select internal** directory, as it is already handled.

**LDAP Configuration** To search in ldap directories, you must have an LDAP server configured. See [LDAP](#) for more details.

**LDAP filter** If you already have an LDAP filter configured for the *Remote directory* Xlet, you can use it.

If not, please refer to [Add a LDAP Filter](#).

**Include the new directory for lookup** You must use the new LDAP filter in the *Context and filter association* step.

## Fax Xlet

### Overview

The Fax xlet allows the user to send faxes from his XiVO client.

### Usage

The *Choose a file to send* field is used to select which file you want to send.

The *Choose destination number* field is the fax destination, directory search can be used to find the fax number in available directories.

### Supported file type

- pdf
- tiff

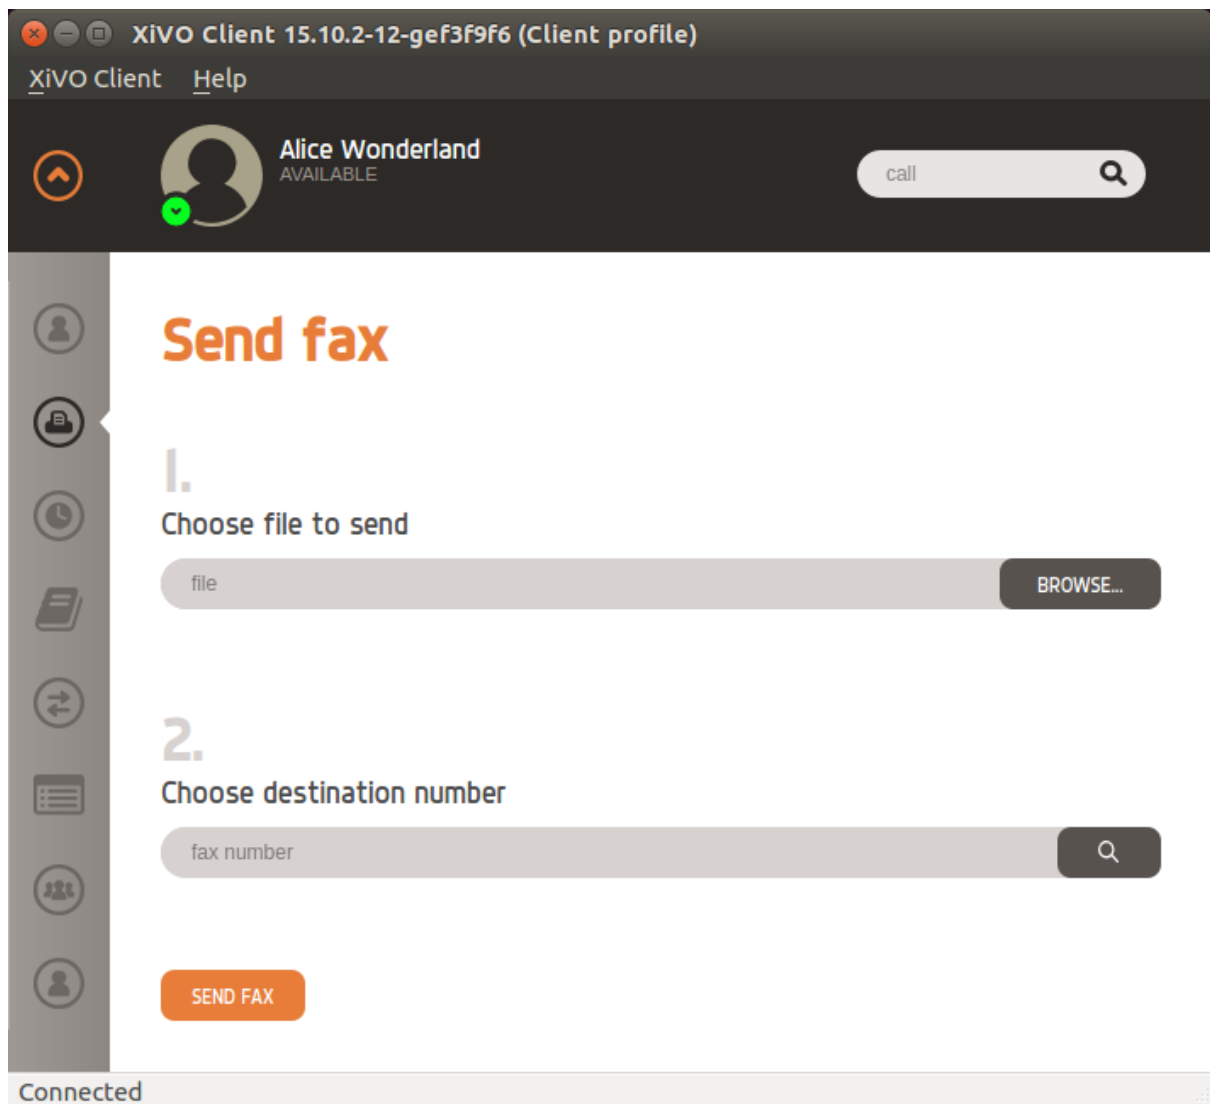

## History Xlet

### Overview

The history xlet allow the user to view his last calls. The user can filter by sent, received and missed calls.

### Usage

The user can click on the number of caller to initiate a new call with a given correspondant.

XiVO Client 15.10.2-12-gef3f9f6 (Client profile)

**Warning:** The column content is only refreshed when moving from one view to the other.

## Identity Xlet

### Overview

The Identity Xlet allows you to make calls from your computer, via your phone. This means that you can enter the number that you want to dial on your computer, then your phone rings and when you answer it, the called phone will ring.

### Usage

You can enter the number you want to dial in the text box and then click the button or press enter to dial it.

If you dial an invalid extension (a number is an extension), your phone will ring and you will be told that the extension is not valid.

### Configuration

In the menu *XiVO Client* → *Configure* → *GUI Settings*, you can enable the integration of the clipboard in the XiVO Client : all text selected in other programs will be automatically pasted in the Dial text box. This feature currently only works on GNU/Linux systems.

## Local Directory Xlet

### Overview

The local directory xlet allow a user to add personnal contacts to the XiVO client.

### Usage

The `New Contact` button allow the user to add a new contact to his local contact file.

The `Export Contacts` button allow the user to save a copy of his local contacts in a file in CSV format.

The `Import Contacts` button allow the user to import a CSV file containing new contacts into his local directory.

The `Search` button allow the user to find an occurrence of a string in his local directory. Clicking the “Ok” button multiple times in the search dialog will find the next occurrence of the searched string.

The `Remove all contacts` button deletes all contacts from the user’s local directory.

The screenshot shows the 'Personal Directory' tab in a web application. At the top, there are tabs for History, Services, Contacts, Conference, Directory, and Personal Directory. Below the tabs are buttons for 'New Contact', 'Export Contacts', 'Import Contacts', 'Search', and 'Remove all Contacts'. A table displays contact information with columns: First Name, Last Name, Phone Number, Email Address, Company, Fax Number, and Mobile Number. The table contains two entries:

	First Name	Last Name	Phone Number	Email Address	Company	Fax Number	Mobile Number
1	Robert	Toto	5555555555				
2	Robert	De Niro	6666666666				

### File format

Imported files should have the following structure:

```
firstname,lastname,phonenumber,emailaddress,company,faxnumber,mobilenumber
Robert,Toto,5555555555,my@email,xivo,1234,5551231234
```

## Remote Directory Xlet

### Overview

The remote directory xlet allows the user to search through the configured directories of the CTI server.

The screenshot shows the 'Remote Directory' tab in a web application. At the top, there are tabs for Contacts, Sheets, Fax, History, Remote Directory, Services, Personal Directory, and Confere. Below the tabs is a search box with the text 'f' and a 'Search' button. A table displays search results with columns: Nom, Numéro, Entreprise, E-mail, and Source. The table contains two entries:

	Nom	Numéro	Entreprise	E-mail	Source
1	Marty McFly	1981	McFly Inc.	marty@mcfly.com	Répertoire XiVO Externe
2	Francis Lalannix	1900	Inconnue		Répertoire XiVO Interne

### Usage

Type the search term in the search box and click on the search button. If the search box is empty, all phonebook entries will be displayed.

Results can be sorted by clicking on one of the column headers. By default, results are sorted using the first column.

Contacts	Sheets	Fax	History	Remote Directory	Services	Personal Directory	Conference
<input type="text"/>							
	Nom	Numéro	Entreprise	E-mail	Source		
1	Bélaïne Alogé	988	Inconnue				
2	Bruce Willis	4182552510	Inconnue				
3	Etienne Lagouste	12345	Inconnue				
4	Hakuna Matata	6666426	Inconnue				
5	Linus Torvalds	4183333333	Inconnue				

Fig. 1.18: Example of contacts sorted by name

Your sorting preference will be saved and restored every time you reconnect.

**Warning:** Since phonebook access is managed by context, a user with no line will not receive any result.

## Service Xlet

### Overview

The service xlet allows the user to enable and disable telephony services such as call forwarding, call filter and do not disturb.

Forward services changes are also reflected in the web interface in the services/ipbx tab under IPBX settings, users. In the user configuration, service tab.

### Configuration

The available service list is configured from the web interface in the services/cti server tab under general settings, profiles.

The right side of the service section contains services that are available to a given profile.

## 1.5.4 Configuration

The XiVO client configuration options can be accessed under *XiVO client* → *configure*.

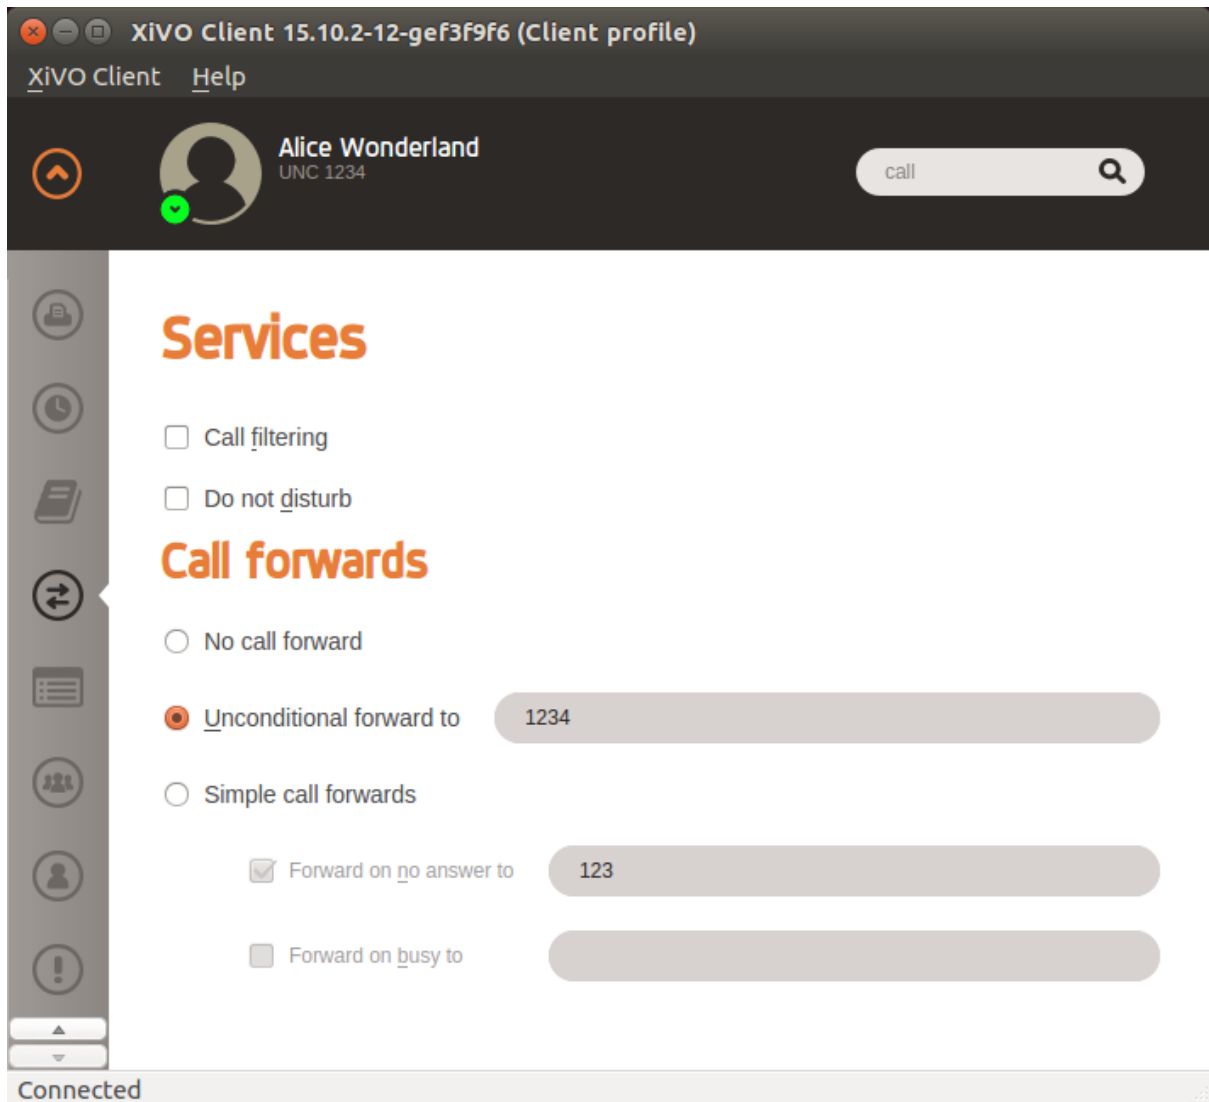

### Connection Configuration

This page allows the user to set his network information to connect to the xivo-ctid server.

- *Server* is the IP address of the server.
- *Backup server* is the IP address of the backup server.
- *Port* is the port on which xivo-ctid is listening for connections. (default: 5003)

If an encrypted connection between the client and server is required, click on the lock icon and change the port value to 5013. The server needs to be configured to *accept encrypted connection*.

### 1.5.5 Handling callto: and tel: URLs

The XiVO client can handle telephone number links that appear in web pages. The client will automatically dial the number when you click on a link.

---

**Note:** You must already be logged in for automatic dialing to work, otherwise the client will simply start up and wait for you to log in.

---

**Warning:** The option in the XiVO Client *GUI Options* → *Allow multiple instances of XiVO Client* must be disabled, else you will launch one new XiVO Client with every click.

### Mac OS

`callto:` links will work out-of-the-box in Safari and other web browsers after installing the client.

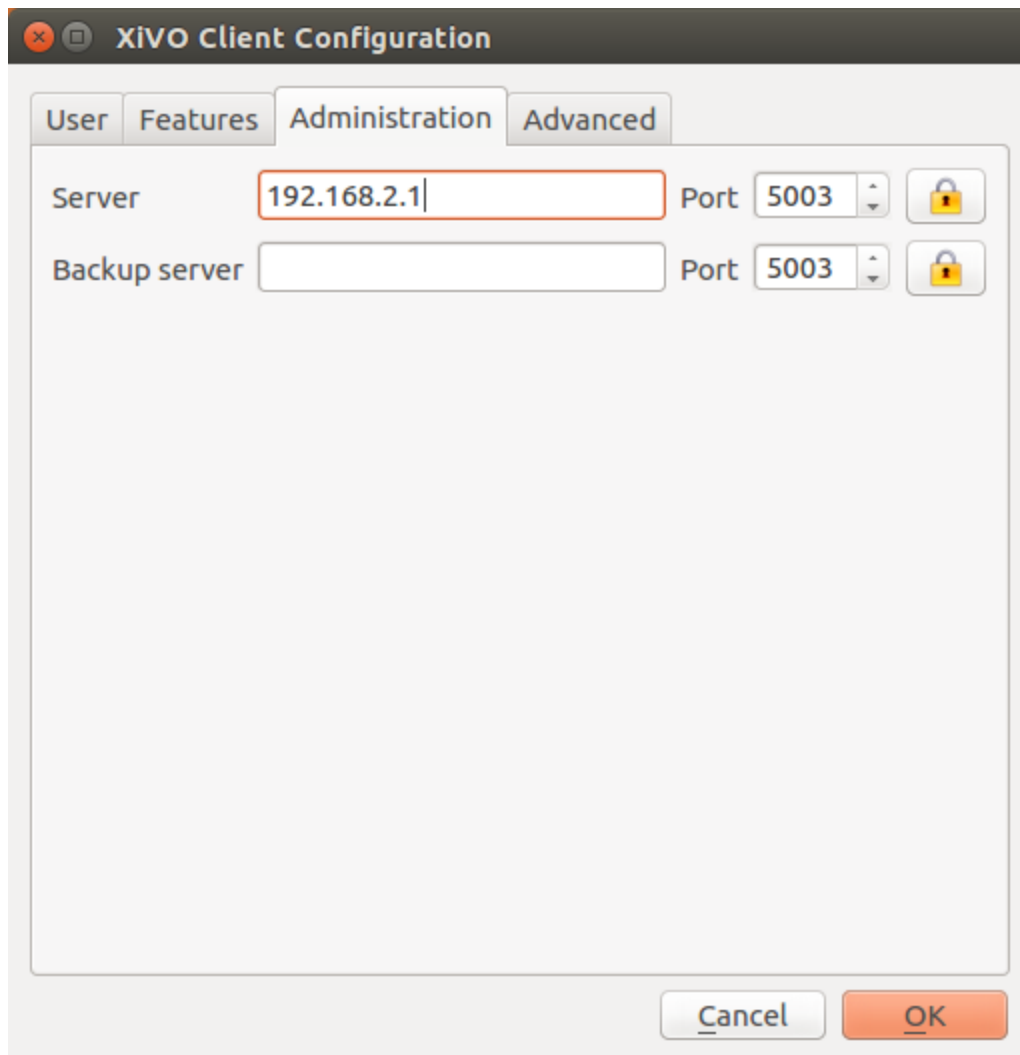

`tel:` links will open facetime after installing the client. To make the xivoclient the default application to open `tel:` URLs in safari.

1. Open the facetime application
2. Connect using your apple account
3. Open the facetime preferences
4. Change the *Default for calls* entry to *xivoclient.app*

---

**Note:** The `tel:` URL works out-of-the-box in versions of mac osx before 10.10.

---

The image shows a 'XiVO Client Configuration' dialog box with a dark title bar. It contains four tabs: 'User', 'Features', 'Administration' (which is selected), and 'Advanced'. Under the 'Administration' tab, there are two rows of configuration fields. The first row is for the 'Server', with a text input field containing '192.168.2.1', a 'Port' dropdown menu set to '5003', and a lock icon. The second row is for the 'Backup server', with an empty text input field, a 'Port' dropdown menu set to '5003', and a lock icon. At the bottom right of the dialog are 'Cancel' and 'OK' buttons.

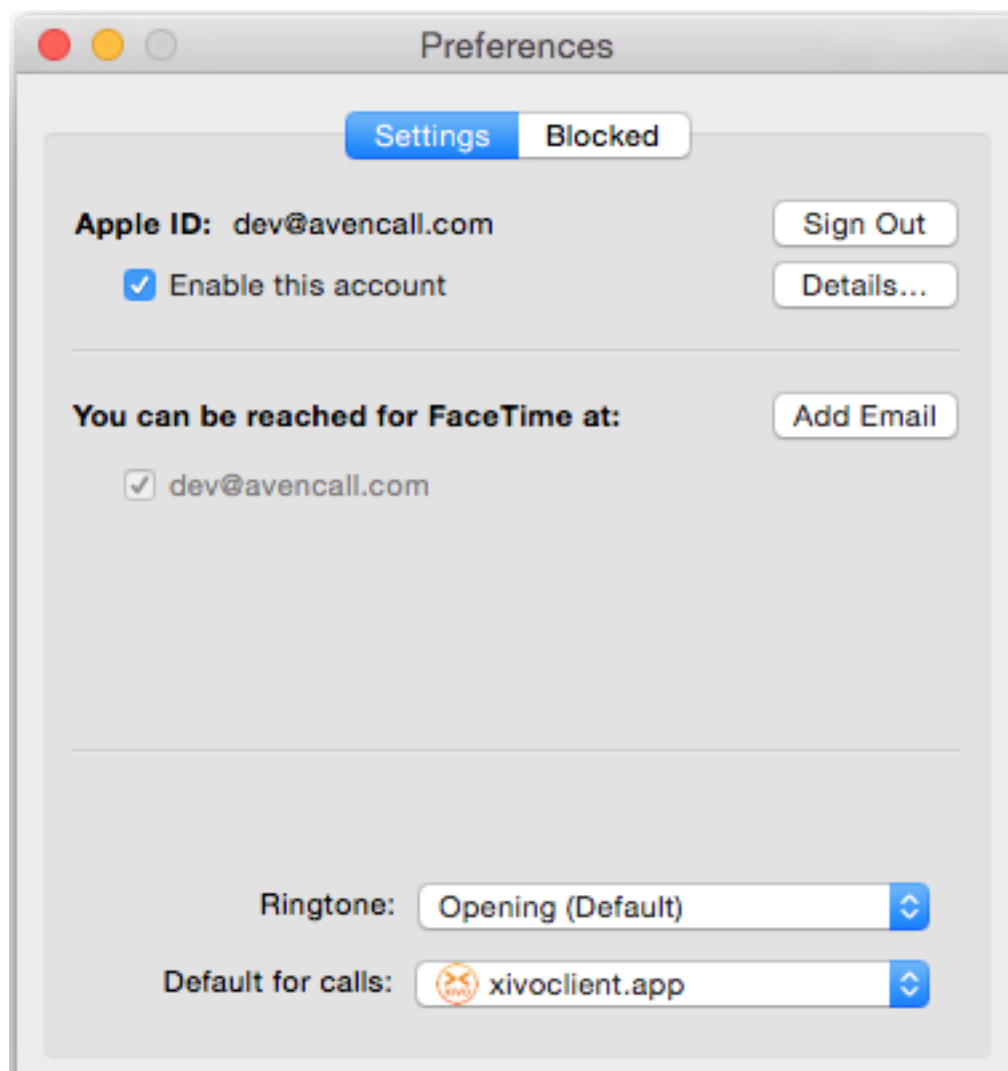

**XiVO Client Configuration**

User Features **Administration** Advanced

Server 192.168.2.1 Port 5003 

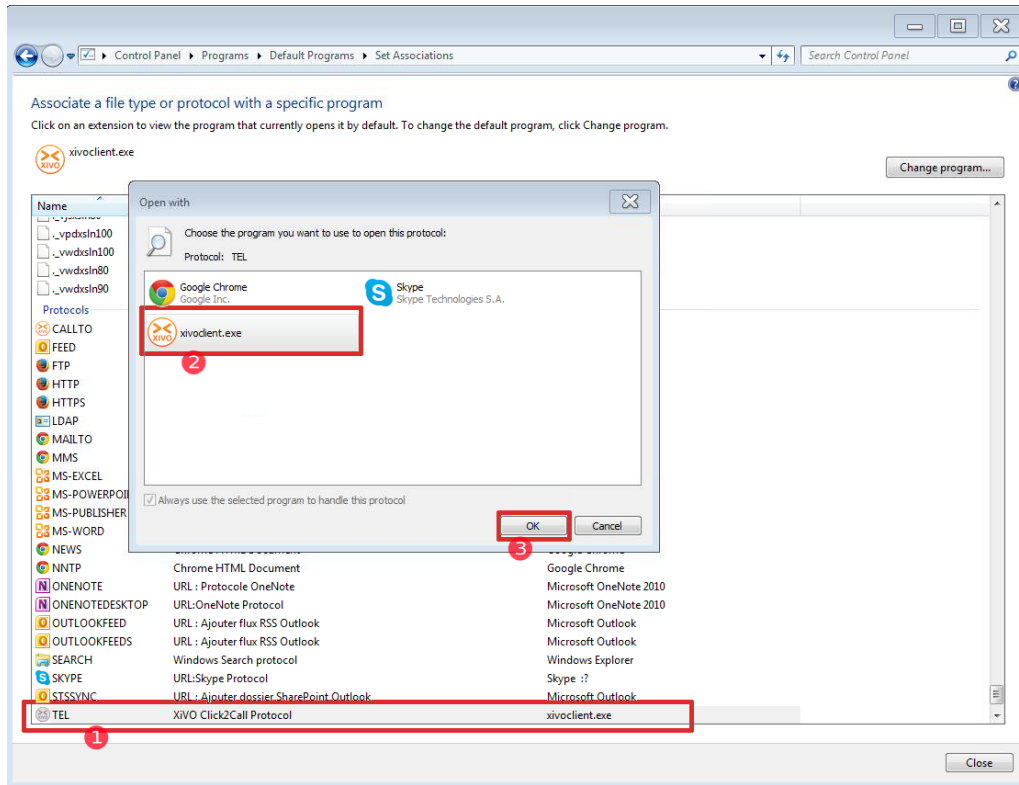

Backup server Port 5003 

Cancel OK

## Windows

XiVO Client is associated with `callto:` and `tel:` upon installation. Installing other applications afterward could end up overriding these associations. Starting with Windows Vista, it is possible to configure these associations via the Default Programs. Users can access Default Programs from Control Panel or directly from the Start menu.

The following popups might appear when you open a `callto:` or `tel:` link for the first time in Internet Explorer:

Simply click on *allow* to dial the number using the XiVO client.

**Note:** If you do not want these warnings to appear each time, do not forget to check/uncheck the checkbox at the bottom of the popups.

## Ubuntu

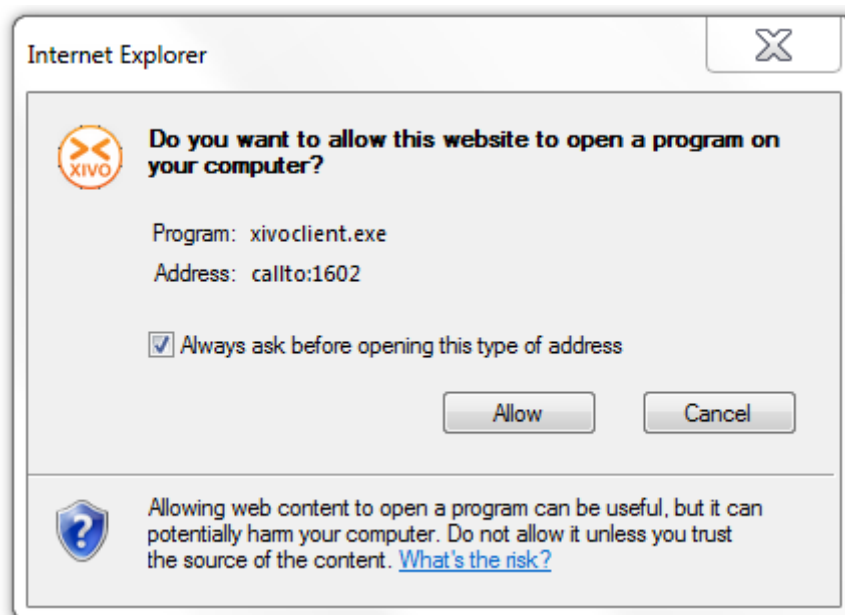

Currently, `callto:` or `tel:` links are only supported in Firefox. There is no configuration needed.

## GNU/Linux Debian

Currently, `callto:` or `tel:` links are only supported in Firefox. If the XiVO Client is not listed in the proposition when you open the link, browse your files to find `/usr/bin/xivoclient`.

## Manual association in Firefox

If, for some reason, Firefox does not recognize `callto:` or `tel:` URIs you can manually associate them to the XiVO client using the following steps:

1. Type `about:config` in the URL bar
2. Click the *I'll be careful, I promise !* button to close the warning
3. Right-click anywhere in the list and select *New -> Boolean*
4. Enter `network.protocol-handler.external.callto` as preference name
5. Select `false` as value
6. Repeat steps 3 to 6, but replace `callto` by `tel` at step 4

The next time that you click on a telephone link, Firefox will ask you to choose an application. You will then be able to choose the XiVO client for handling telephone numbers.

## 1.6 System

### 1.6.1 DHCP Server

XiVO includes a DHCP server that must be used to address telephony devices (*Basic Configuration*) of the VOIP subnet. This section describes how to configure DHCP server for other subnets or with advanced options.

#### Activation of DHCP server

DHCP Server can be activated through the XiVO Web Interface *Configuration → Network → DHCP* :

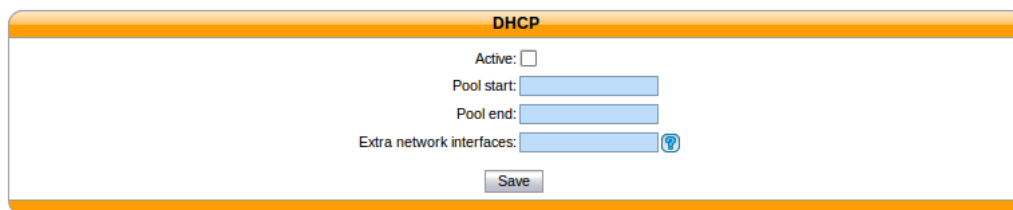

Fig. 1.19: *Configuration → Network → DHCP*

By default, it will only answer to DHCP requests coming from the VoIP subnet (defined in the *Configuration → Network → Interfaces* section). If you need to activate DHCP server on an other interface, you have to fill the *Extra network interfaces* field with, for example : `eth0`

After saving your modifications, you need to click on *Apply system configuration* for them to be applied.

#### Change default gateway for DHCP

By default, the XiVO DHCP server gives the XiVO IP address in the router option. To change this you must create a custom-template:

1. Create a custom template for the `dhcpd_subnet.conf.head` file:

```
mkdir -p /etc/xivo/custom-templates/dhcp/etc/dhcp/
cd /etc/xivo/custom-templates/dhcp/etc/dhcp/
cp /usr/share/xivo-config/templates/dhcp/etc/dhcp/dhcpd_subnet.conf.head .
```

2. Edit the custom template:

```
vim dhcpd_subnet.conf.head
```

3. In the file, replace the string `#XIVO_NET4_IP#` by the router of your VoIP network, for example :

```
option routers 192.168.2.254;
```

4. Re-generate the dhcp configuration:

```
xivo-update-config
```

DHCP server should have been restarted and should now give the new router option.

### Configuring DHCP server to serve unknown hosts

By default, the XiVO DHCP server serves only known hosts. That is:

- either hosts which MAC address prefix (the OUI) is known
- or hosts which Vendor Identifier is known

Known OUIs and Vendor Class Identifiers are declared in `/etc/dhcp/dhcpd_update/*` files.

If you want your XiVO DHCP server to serve also unknown hosts (like PCs) follow these instructions:

1. Create a custom template for the `dhcpd_subnet.conf.tail` file:

```
mkdir -p /etc/xivo/custom-templates/dhcp/etc/dhcp/  
cd /etc/xivo/custom-templates/dhcp/etc/dhcp/  
cp /usr/share/xivo-config/templates/dhcp/etc/dhcp/dhcpd_subnet.conf.tail .
```

2. Edit the custom template:

```
vim dhcpd_subnet.conf.tail
```

3. And add the following line at the head of the file:

```
allow unknown-clients;
```

4. Re-generate the dhcp configuration:

```
xivo-update-config
```

DHCP server should have been restarted and should now serve all network equipments.

### DHCP-Relay

If your telephony devices aren't located on the same site and the same broadcast domain as the XiVO DHCP server, you will have to add the option *DHCP Relay* to the site's router. This parameter will permit the DHCP requests from distant devices to be transmitted to the IP address you specify as DHCP Relay.

**Warning:** Please make sure that the IP address used as DHCP Relay is one of the XiVO interface, and that this interface is configured to listen to DHCP requests (as described in previous part). Also verify that routing is configured between the distant router and the chosen interface, otherwise DHCP requests will never reach the XiVO server.

### Configuring DHCP server for other subnets

This section describes how to configure XiVO to serve other subnets than the VOIP subnet. As you can't use the Web Interface to declare other subnets (for example to address DATA subnet, or a VOIP subnet that isn't on the same site than XiVO server), you'll have to do the following configuration in Command Line Interface.

## Creating “extra subnet” configuration files

First thing to do is to create a directory and to copy into it the configuration files:

```
mkdir /etc/dhcp/dhcpd_sites/
cp /etc/dhcp/dhcpd_subnet.conf /etc/dhcp/dhcpd_sites/dhcpd_siteXXX.conf
cp /etc/dhcp/dhcpd_subnet.conf /etc/dhcp/dhcpd_sites/dhcpd_lanDATA.conf
```

**Note:** In this case we’ll create 2 files for 2 different subnets. You can change the name of the files, and create as many files as you want in the folder `/etc/dhcp/dhcpd_sites/`. Just adapt this procedure by changing the name of the file in the different links.

After creating one or several files in `/etc/dhcp/dhcpd_sites/`, you have to edit the file `/etc/dhcp/dhcpd_extra.conf` and add the according include statement like:

```
include "/etc/dhcp/dhcpd_sites/dhcpd_siteXXX.conf";
include "/etc/dhcp/dhcpd_sites/dhcpd_lanDATA.conf";
```

## Adjusting Options of the DHCP server

Once you have created the subnet in the DHCP server, you must edit each configuration file (the files in `/etc/dhcp/dhcpd_sites/`) and modify the different parameters. In section **subnet**, write the IP subnet and change the following options (underlined fields in the example):

```
subnet 172.30.8.0 netmask 255.255.255.0 {
```

- subnet-mask:

```
option subnet-mask 255.255.255.0;
```

- broadcast-address:

```
option broadcast-address 172.30.8.255;
```

- routers (specify the IP address of the router that will be the default gateway of the site):

```
option routers 172.30.8.1;
```

In section **pool**, modify the options:

```
pool {
```

- log (add the name of the site or of the subnet):

```
log(concat("[", binary-to-ascii(16, 8, ":", hardware), "] POOL VoIP Site XXX"));
```

- range (it will define the range of IP address the DHCP server can use to address the devices of that subnet):

```
range 172.30.8.10 172.30.8.200;
```

**Warning:** XiVO only answers to DHCP requests from *supported devices*. In case of you need to address other equipment, use the option *allow unknown-clients*; in the `/etc/dhcp/dhcpd_sites/` files

At this point, you can apply the changes of the DHCP server with the command:

```
/etc/init.d/isc-dhcp-server restart
```

After that, XiVO will start to serve the DHCP requests of the devices located on other site or other subnet than the VOIP subnet. You will see in `/var/log/daemon.log` all the DHCP requests received and how they are handled by XiVO.

## 1.6.2 Mail

This section describes how to configure the mail server shipped with XiVO (Postfix) and the way XiVO handles mails.

In *Configuration* → *Network* → *Mail*, the following options can be configured:

- *Domain Name messaging* : the server's displayed domain. Will appear in "Received" mail headers.
- *Source address of the server* : domain part of headers "Return-Path" and "From".
- *Relay SMTP* and *FallBack relay SMTP* : relay mail servers.
- *Rewriting shipping addresses* : Canonical address Rewriting. See [Postfix canonical documentation](#) for more info.

**Warning:** Postfix, the mail server shipped with XiVO, should be stopped on an installed XiVO with no valid and reachable DNS servers configured. If Postfix is not stopped, messages will bounce in queues and could end up affecting core pbx features.

If you need to disable Postfix here is how you should do it:

```
/etc/init.d/postfix stop
insserv -r postfix
```

If you ever need to enable Postfix again:

```
insserv postfix
/etc/init.d/postfix start
```

Alternatively, you can empty Postfix's queues by issuing the following commands on the XiVO server:

```
postsuper -d ALL
```

## 1.6.3 Network

You **must** configure your network interfaces directly from the XiVO web interface via the *Configuration* → *Network* → *Interfaces* page.

The Voip interface is used by the DHCP server and the provisioning server.

### How-to

You can only have one VoIP interface, which is eth0 by default. This interface is configured during the wizard.

The DHCP server and provisioning server, among other, use information from the VoIP interface in its configuration. For example, the DHCP server will only listen on the VoIP interface per default.

To change this interface, you must either create a new one or edit an existing one and change its type to VoIP. The type of the old interface will automatically be changed to the 'data' type.

### Configuring a physical interface

In this example, we'll add and configure the *eth1* network interface on our XiVO.

First, we see there's already an unconfigured network interface named "eth1" on our system:

Listing the network interfaces

To add and configure it, we click on the small plus button next to it, and we get to this page:

Configure physical interface

Configuration		Interface	Mac address	Type	Method	Address	Gateway	VLAN ID	Action
<b>Management</b>		<input type="checkbox"/> > eth0	08:00:27:ea:b0:75	VoIP	Static	192.168.32.137	192.168.32.254	-	
		<input type="checkbox"/> > eth1	08:00:27:29:b7:e9	Data	-	-	-	-	
<b>Network</b>									
Interfaces									

**Legend**

> Enable > Disable > Not apply

### Interfaces > Add

Interface:

Type:

Method:

Address:

Netmask:

Default gateway:

Description:

Save

In our case, since we want to configure this interface with static information (i.e. not via DHCP), we fill the following fields:

The screenshot shows the 'Interfaces > Add' configuration page. The form has the following fields:

- Interface:
- Type:
- Method:
- Address:
- Netmask:
- Default gateway:
- Description:

A red circle highlights the Address, Netmask, and Default gateway fields. At the bottom of the form is a  button.

Configure physical interface

Note that since our “eth0” network interface already has a default gateway, we do not enter information in the “Default gateway” field for our “eth1” interface.

Once we click on “Save”, the XiVO will put the “Apply network configuration” button in bold.

To reconfigure the given network interface with the new information, you click on it.

## Adding a VLAN interface

First, we see there’s already a configured network interface on our system:

Listing the network interfaces

To add and configure a new VLAN interface, we click on the small plus button in the top right corner, and we get to this page:

In our case, since we want to configure this interface with static information:

Click on **Save** list the network interfaces:

- The new virtual interface has been successfully created.

---

**Note:** Do not forget after you finish the configuration of the network to apply it with the button: **Apply network configuration**

---

After applying the network configuration:

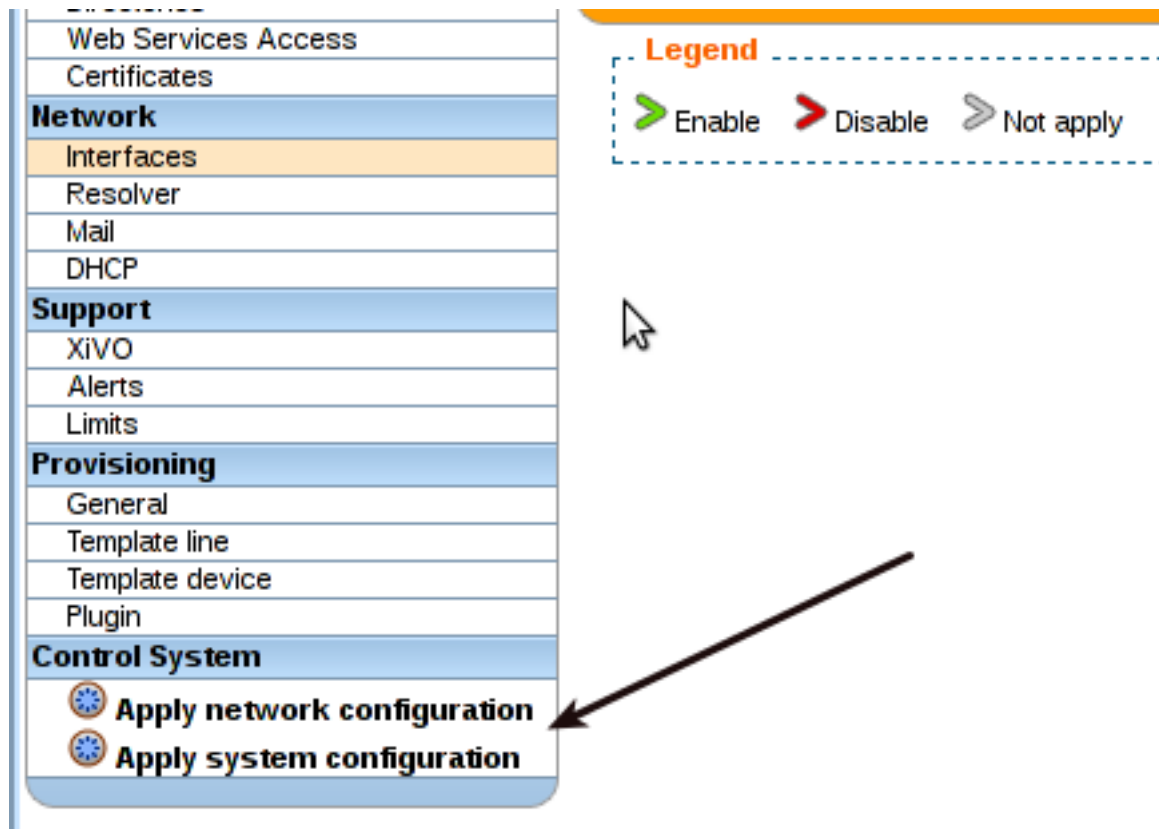

Fig. 1.20: Apply after modify interface

Interface	Mac address	Type	Method	Address	Gateway	Action
<input type="checkbox"/> > eth0	08:00:27:6a:49:e5	Data	Static	192.168.32.51	192.168.32.254	
<input type="checkbox"/> > eth1	08:00:27:e9:fa:f4	VoIP	Static	10.97.5.2	-	

**Legend**

<input type="checkbox"/> > eth1	08:00:27:e9:fa:f4

Fig. 1.25: Listing the network interfaces

## Add static network routes

Static route can't be currently added via the web interface. If you want static routes in your XiVO you should do the following steps described below. It would ensure that your static routes are applied at startup (in fact each time the network interface goes up).

1. Create the file `/etc/network/if-up.d/xivo-routes`:

```
touch /etc/network/if-up.d/xivo-routes
chmod 755 /etc/network/if-up.d/xivo-routes
```

2. Insert the following content:

```
#!/bin/sh

if [ "${IFACE}" = "<network interface>" ]; then
    ip route add <destination> via <gateway>
    ip route add <destination> via <gateway>
fi
```

3. Fields `<network interface>`, `<destination>` and `<gateway>` should be replaced by your specific configuration. For example, if you want to add a route for 192.168.50.128/25 via 192.168.17.254 which should be added when eth0.100 goes up:

```
#!/bin/sh

if [ "${IFACE}" = "eth0.100" ]; then
    ip route add 192.168.50.128/25 via 192.168.17.254
fi
```

---

**Note:** You need to check which interface goes up to add routes only if the right interface goes up. Otherwise the system will try to set the routes each time any interface goes up.

---

## Change interface MTU

**Warning:** Changing the MTU is risky. You should know what you are doing.

If you need to change the MTU here is how you should do it:

1. Create the file `/etc/network/if-up.d/xivo-mtu`:

```
touch /etc/network/if-up.d/xivo-mtu
chmod 755 /etc/network/if-up.d/xivo-mtu
```

2. Insert the following content:

```
#!/bin/sh

# Set MTU per iface
if [ "${IFACE}" = "<data interface>" ]; then
    ip link set ${IFACE} mtu <data mtu>
elif [ "${IFACE}" = "<voip interface>" ]; then
    ip link set ${IFACE} mtu <voip mtu>
fi
```

3. Change the `<data interface>` to the name of your interface (e.g. eth0), and the `<data mtu>` to the new MTU (e.g. 1492),
4. Change the `<voip interface>` to the name of your interface (e.g. eth0.10), and the `<voip mtu>` to the new MTU (e.g. 1488)

**Note:** In the above example you can set a different MTU per interface. If you don't need a per-interface MTU you can simply write:

```
#!/bin/sh

ip link set ${IFACE} mtu <my mtu>
```

## 1.6.4 Backup

### Periodic backup

A backup of the database and the data are launched every day with a logrotate task. It is run at 06:25 a.m. and backups are kept for 7 days.

Logrotate task:

```
/etc/logrotate.d/xivo-backup
```

Logrotate cron:

```
/etc/cron.daily/logrotate
```

### Retrieve the backup

You can retrieve the backup from the web-interface in *Services* → *IPBX* → *IPBX Configuration* → *Backup Files* page.

Otherwise, with shell access, you can retrieve them in `/var/backups/xivo`. In this directory you will find `db.tgz` and `data.tgz` files for the database and data backups.

Backup script:

```
/usr/sbin/xivo-backup
```

Backup location:

```
/var/backups/xivo
```

### What is actually backed-up?

#### Data

Here is the list of folders and files that are backed-up:

- `/etc/asterisk`
- `/etc/dahdi`
- `/etc/dhcp`
- `/etc/hostname`
- `/etc/hosts`
- `/etc/ldap`
- `/etc/network/if-up.d/xivo-routes`
- `/etc/network/interfaces`
- `/etc/ntp.conf`
- `/etc/xivo`

- /etc/resolv.conf
- /etc/ssl
- /etc/wanpipe
- /var/lib/asterisk
- /var/lib/consul
- /var/lib/xivo
- /var/lib/xivo-provd
- /var/log/asterisk
- /var/spool/asterisk
- /usr/local/sbin

The following files/folders are excluded from this backup:

- folders:
  - /var/lib/xivo-provd/plugins/\*/var/cache/\*
  - /var/spool/asterisk/monitor
  - /var/spool/asterisk/meetme
- log files, coredump files
- audio recordings
- and, files greater than 10 MiB or folders containing more than 100 files if they belong to one of these folders:
  - /var/lib/xivo/sounds
  - /var/lib/asterisk/sounds/custom
  - /var/lib/asterisk/moh
  - /var/spool/asterisk/voicemail
  - /var/spool/asterisk/monitor

## Database

### Creating a database backup file manually

**Warning:** A backup file may take a lot of space on the disk. You should check the free space on the partition before creating one.

You can manually create a *database* backup file named `db-manual.tgz` in `/var/tmp` by issuing the following commands:

```
xivo-backup db /var/tmp/db-manual
```

### Creating a data backup file manually

**Warning:** A backup file may take a lot of space on the disk. You should check the free space on the partition before creating one.

You can manually create a *data* backup file named `data-manual.tgz` in `/var/tmp` by issuing the following commands:

```
xivo-backup data /var/tmp/data-manual
```

## 1.6.5 Restore

### Introduction

A backup of both the configuration files and the database used by a XiVO installation is done automatically every day. These backups are created in the `/var/backups/xivo` directory and are kept for 7 days.

### Limitations

- You must restore a backup on the **same version** of XiVO that was backed up
- Be aware that this procedure applies **only to XiVO >= 14.08** (see [14.08](#)).

### Before Restoring the System

**Warning:** Before restoring a XiVO on a fresh install you have to setup XiVO using the wizard (see [Running the Wizard](#) section).

Stop monit and all the xivo services:

```
xivo-service stop
```

### Restoring System Files

System files are stored in the `data.tgz` file located in the `/var/backups/xivo` directory.

This file contains for example, voicemail files, musics, voice guides, phone sets firmwares, provisioning server configuration database.

To restore the file

```
tar xvpf /var/backups/xivo/data.tgz -C /
```

### Restoring the Database

**Warning:**

- This will destroy all the current data in your database.
- You have to check the free space on your system partition before extracting the backups.

Database backups are created as `db.tgz` files in the `/var/backups/xivo` directory. These tarballs contains a dump of the database used in XiVO.

In this example, we'll restore the database from a backup file named `db.tgz` placed in the home directory of root.

First, extract the content of the `db.tgz` file into the `/var/tmp` directory and go inside the newly created directory:

```
tar xvf db.tgz -C /var/tmp
cd /var/tmp/pg-backup
```

Drop the asterisk database and restore it with the one from the backup:

```
sudo -u postgres dropdb asterisk
sudo -u postgres pg_restore -C -d postgres asterisk-*.dump
```

## Restoring and Keeping System Configuration

System configuration like network interfaces is stored in the database. It is possible to keep this configuration and only restore xivo data.

Rename the asterisk database to asterisk\_previous:

```
sudo -u postgres psql -c 'ALTER DATABASE asterisk RENAME TO asterisk_previous'
```

Restore the asterisk database from the backup:

```
sudo -u postgres pg_restore -C -d postgres asterisk-*.dump
```

Restore the system configuration tables from the asterisk\_previous database:

```
sudo -u postgres pg_dump -c -t dhcp -t netiface -t resolvconf asterisk_previous | sudo -u postgres psql
```

Drop the asterisk\_previous database:

```
sudo -u postgres dropdb asterisk_previous
```

**Warning:** Restoring the data.tgz file also restores system files such as host hostname, network interfaces, etc. You will need to reapply the network configuration if you restore the data.tgz file.

## After Restoring The System

Restart the services you stopped in the first step:

```
xivo-service start
```

You may also reboot the system.

### 1.6.6 HTTPS certificate

X.509 certificates are used to authorize and secure communications with the server. They are mainly used for HTTPS, but can also be used for SIPS, CTIS, etc.

There are two categories of certificates in XiVO:

- the default certificate, used for HTTPS in the web interface and REST APIs
- the certificates created and managed via the web interface

This article is about the former. For the latter, see *Telephony certificates*.

## HTTPS

XiVO uses HTTPS where possible. The certificates are generated at install time (or during the *upgrade to 15.12+*). The main certificate is placed in `/usr/share/xivo-certs/server.crt`.

However, this certificate is self-signed, and HTTP clients (browser or REST API client) will complain about this default certificate because it is not signed by a trusted Certification Authority (CA). To make the HTTP client accept this certificate, you have two choices:

- replace the self-signed certificate with your own trusted certificate. For this, you can replace the following files:

- Private key: `/usr/share/xivo-certs/server.key`
- Certificate: `/usr/share/xivo-certs/server.crt`
- configure your HTTP client to trust the self-signed certificate by adding a new trusted CA. The CA certificate (or bundle) is the file `/usr/share/xivo-certs/server.crt`.

### 1.6.7 Configuration Files

This section describes some of the XiVO configuration files.

#### Configuration priority

Usually, the configuration is read from two locations: a configuration file `config.yml` and a configuration directory `conf.d`.

Files in the `conf.d` extra configuration directory are used in alphabetical order and the first one has priority. For example:

`00-debug.yml:`

```
debug: True
```

`01-nodebug.yml:`

```
debug: False
```

The value that will be used for `debug` will be `True` since `00-debug.yml` comes before `01-nodebug.yml` in the alphabetical order.

#### **xivo-agentd**

The configuration is done in the configuration directory. The configuration file should not be modified, because it will be overridden by upgrades.

- Default configuration directory: `/etc/xivo-agentd/conf.d`
- Default configuration file: `/etc/xivo-agentd/config.yml`

The configuration file may be used as an example for supported configuration file values.

See also [Configuration priority](#).

#### **xivo-auth**

The configuration is done in the configuration directory. The configuration file should not be modified, because it will be overridden by upgrades.

- Default configuration directory: `/etc/xivo-auth/conf.d`
- Default configuration file: `/etc/xivo-auth/config.yml`

The configuration file may be used as an example for supported configuration file values.

See also [Configuration priority](#).

#### **xivo-ctid**

The configuration is done in the configuration directory. The configuration file should not be modified, because it will be overridden by upgrades.

- Default configuration directory: `/etc/xivo-ctid/conf.d`

- Default configuration file: `/etc/xivo-ctid/config.yml`

The configuration file may be used as an example for supported configuration file values.

See [Configuration priority](#).

### xivo\_ring.conf

- Path: `/etc/xivo/asterisk/xivo_ring.conf`
- Purpose: This file can be used to change the ringtone played by the phone depending on the origin of the call.

**Warning:** Note that this feature has not been tested for all phones and all call flows. This page describes how you can customize this file but does not intend to list all validated call flows or phones.

This file `xivo_ring.conf` consists of :

- profiles of configuration (some examples for different brands are already included: `[aastra]`, `[snom]` etc.)
- one section named `[number]` where you apply the profile to an extension or a context etc.

Here is the process you should follow if you want to use/customize this feature :

1. Create a new profile, e.g.:

```
[myprofile-aastra]
```

2. Change the `phonetype` accordingly, in our example:

```
[myprofile-aastra]
phonetype = aastra
```

3. Chose the ringtone for the different type of calls (note that the ringtone names are brand-specific):

```
[myprofile-aastra]
phonetype = aastra
intern = <Bellcore-dr1>
group = <Bellcore-dr2>
```

4. Apply your profile, in the section `[number]`

- to a given list of extensions (e.g. 1001 and 1002):

```
1001@default = myprofile-aastra
1002@default = myprofile-aastra
```

- or to a whole context (e.g. default):

```
@default = myprofile-aastra
```

5. Restart `xivo-agid` service:

```
service xivo-agid restart
```

### ipbx.ini

- Path: `/etc/xivo/web-interface/ipbx.ini`
- Purpose: This file specifies various configuration options and paths related to Asterisk and used by the web interface.

Here is a partial glimpse of what can be configured in file `ipbx.ini` :

### 1. Enable/Disable modification of SIP line username and password:

```
[user]
readonly-idpwd = "true"
```

When editing a SIP line, the username and password fields cannot be modified via the web interface. Set this option to false to enable the modification of both fields. This option is set to “true” by default.

**Warning:** This feature is not fully tested. It should be used only when absolutely necessary and with great care.

## 1.6.8 Consul

The default `consul` installation in XiVO uses the configuration file in `/etc/consul/xivo/*.json`. All files in this directory are installed with the package and *should not* be modified by the administrator. To use a different configuration, the administrator can add it's own configuration file at another location and set the new configuration directory in the `/etc/default/consul` file.

The default installation generates a master token that can be retrieved in `/usr/lib/consul/master_token`. This master token will not be used if a new configuration is supplied.

### Variables

The following variables can be overridden in the `/etc/default/consul` file.

```
CONFIG_DIR=/etc/consul/xivo      # The configuration directory
USER=consul                     # The user used to run the consul process
GROUP=consul                    # The group used to run the consul process
PIDDIR=/var/run/consul          # The directory where the pidfile will be written
PIDFILE=/var/run/consul/consul.pid # The name of the pidfile (PIDDIR must match)
```

## 1.6.9 Log Files

Every XiVO service has its own log file, placed in `/var/log`.

### agid

- File location: `/var/log/xivo-agid.log`
- Rotate configuration: `/etc/logrotate.d/xivo-agid`
- Number of archived files: 15
- Rotation frequency: Daily

### asterisk

The Asterisk log files are managed by logrotate.

It's configuration files `/etc/logrotate.d/asterisk` and `/etc/asterisk/logger.conf`

The message log level is enabled by default in `logger.conf` and contains notices, warnings and errors. The full log entry is commented in `logger.conf` and should only be enabled when verbose debugging is required. Using this option in production would produce VERY large log files.

- Files location: `/var/log/asterisk/*`
- Number of archived files: 15

- Rotation frequency: Daily

### **provd**

- File location: `/var/log/xivo-provd.log`
- Rotate configuration: `/etc/logrotate.d/xivo-provd`
- Number of archived files: 15
- Rotation frequency: Daily

### **sysconfd**

- File location: `/var/log/xivo-sysconfd.log`
- Rotate configuration: `/etc/logrotate.d/xivo-sysconfd`
- Number of archived files: 15
- Rotation frequency: Daily

### **web-interface**

- File location: `/var/log/xivo-web-interface/*.log`
- Rotate configuration: `/etc/logrotate.d/xivo-web-interface`
- Number of archived files: 21
- Rotation frequency: Daily

### **xivo-confgend**

The xivo-confgend daemon output is sent to the file specified with the `--logfile` parameter when launched with `twistd`.

The file location can be changed in `/etc/init.d/xivo-confgend`. Search the line beginning with `logfile=/var/log/xivo-confgend.log` and change it to your liking.

- File location: `/var/log/xivo-confgend.log`
- Rotate configuration: `/etc/logrotate.d/xivo-confgend`
- Number of archived files: 15
- Rotation frequency: Daily

### **xivo-ctid**

- File location: `/var/log/xivo-ctid.pid`
- Rotate configuration: `/etc/logrotate.d/xivo-ctid`
- Number of archived log files: 15
- Rotation frequency: Daily

## **1.6.10 NTP**

XiVO has a NTP server, that must be synchronized to a reference server. This can be a public one or customized for specific target networking architecture. XiVO's NTP server is used by default as NTP server for the devices time reference.

## Usage

Show NTP service status:

```
/etc/init.d/ntp status
```

Stop NTP service:

```
/etc/init.d/ntp stop
```

Start NTP service:

```
/etc/init.d/ntp start
```

Restart NTP service:

```
/etc/init.d/ntp restart
```

Show NTP synchronization status:

```
ntpq -p
```

## Configuring NTP service

1. Edit `/etc/ntp.conf`
2. Give your NTP reference servers:

```
server 192.168.0.1                # LAN existing NTP Server
server 0.debian.pool.ntp.org iburst dynamic # default in ntp.conf
server 1.debian.pool.ntp.org iburst dynamic # default in ntp.conf
```

3. If no reference server to synchronize to, add this to synchronize locally:

```
server 127.127.1.0                # local clock (LCL)
fudge 127.127.1.0 stratum 10      # LCL is not very reliable
```

4. Restart NTP service
5. Check NTP synchronization status.

**Warning:** If #5 shows that NTP doesn't use NTP configuration in `/etc/ntp.conf`, maybe have you done a `dhclient` for one of your network interface and the `dhcp` server that gave the IP address also gave a NTP server address. Thus you might check if the file `/var/lib/ntp/ntp.conf.dhcp` exists, if yes, this is used for NTP configuration prior to `/etc/ntp.conf`. Remove it and restart NTP, check NTP synchronization status, then it should work.

## 1.6.11 Proxy Configuration

If you use XiVO behind an HTTP proxy, you must do a couple of manipulations for it to work correctly.

### apt

Create the `/etc/apt/apt.conf.d/90proxy` file with the following content:

```
Acquire::http::Proxy "http://domain\username:password@proxyip:proxyport";
```

### provd

Proxy information is set via the *Configuration* → *Provisioning* → *General* page.

## dhcp-update

*This step is needed if you use the DHCP server of the XiVO. Otherwise the DHCP configuration won't be correct.*

Proxy information is set via the `/etc/xivo/dhcpd-update.conf` file.

Edit the file and look for the `[proxy]` section.

## xivo-fetchfw

*This step is not needed if you don't use xivo-fetchfw.*

Proxy information is set via the `/etc/xivo/xivo-fetchfw.conf` file.

Edit the file and look for the `[proxy]` section.

## 1.6.12 Purge Logs

Keeping records of personal communications for long periods may be subject to local legislation, to avoid personal data retention. Also, keeping too many records may become resource intensive for the server. To ease the removal of such records, `xivo-purge-db` is a process that removes old log entries from the database. This allows keeping records for a maximum period and deleting older ones.

By default, `xivo-purge-db` removes all logs older than a year (365 days). `xivo-purge-db` is run nightly.

---

**Note:** Please check the laws applicable to your country and modify `days_to_keep` (see below) in the configuration file accordingly.

---

### Tables Purged

The following features are impacted by `xivo-purge-db`:

- *Call Logs*
- *Call center statistics*

More technically, the tables purged by `xivo-purge-db` are:

- `call_logs`
- `cel`
- `queue_log`
- `stat_agent_periodic`
- `stat_call_on_queue`
- `stat_queue_periodic`

### Configuration File

We recommend to override the setting `days_to_keep` from `/etc/xivo-purge-db/config.yml` in a new file in `/etc/xivo-purge-db/conf.d/`.

**Warning:** Setting `days_to_keep` to 0 will NOT disable `xivo-purge-db`, and will remove ALL logs from your system.

See *Configuration priority* and `/etc/xivo-purge-db/config.yml` for more details.

## Manual Purge

It is possible to purge logs manually. To do so, log on to the target XiVO server and run:

```
xivo-purge-db
```

You can specify the number of days of logs to keep. For example, to purge entries older than 365 days:

```
xivo-purge-db -d 365
```

Usage of xivo-purge-db:

```
usage: xivo-purge-db [-h] [-d DAYS_TO_KEEP]

optional arguments:
  -h, --help            show this help message and exit
  -d DAYS_TO_KEEP, --days_to_keep DAYS_TO_KEEP
                        Number of days data will be kept in tables
```

## Maintenance

After an execution of xivo-purge-db, postgresql's [Autovacuum Daemon](#) should perform a [VACUUM ANALYZE](#) automatically (after 1 minute). This command marks memory as reusable but does not actually free disk space, which is fine if your disk is not getting full. In the case when xivo-purge-db hasn't run for a long time (e.g. upgrading to 15.11 or when *days\_to\_keep* is decreased), some administrator may want to perform a [VACUUM FULL](#) to recover disk space.

**Warning:** VACUUM FULL will require a service interruption. This may take several hours depending on the size of purged database.

You need to:

```
$ xivo-service stop
$ sudo -u postgres psql asterisk -c "VACUUM (FULL) "
$ xivo-service start
```

## Archive Plugins

In the case you want to keep archives of the logs removed by xivo-purge-db, you may install plugins to xivo-purge-db that will be run before the purge.

XiVO does not provide any archive plugin. You will need to develop plugins for your own need. If you want to share your plugins, please open a [pull request](#).

### Archive Plugins (for Developers)

Each plugin is a Python callable (function or class constructor), that takes a dictionary of configuration as argument. The keys of this dictionary are the keys taken from the configuration file. This allows you to add plugin-specific configuration in `/etc/xivo-purge-db/conf.d/`.

There is an example plugin in the [xivo-purge-db git repo](#).

### Example

Archive name: sample

Purpose: demonstrate how to create your own archive plugin.

**Activate Plugin** Each plugin needs to be explicitly enabled in the configuration of xivo-purge-db. Here is an example of file added in /etc/xivo-purge-db/conf.d/:

```
1 enabled_plugins:
2   archives:
3     - sample
```

**sample.py** The following example will be save a file in /tmp/xivo\_purge\_db.sample with the following content:

```
Save tables before purge. 365 days to keep!
```

```
1 sample_file = '/tmp/xivo_purge_db.sample'
2
3 def sample_plugin(config):
4     with open(sample_file, 'w') as output:
5         output.write('Save tables before purge. {0} days to keep!'.format(config['days_to_keep']))
```

**Install sample plugin** The following setup.py shows an example of a python library that adds a plugin to xivo-purge-db:

```
1 #!/usr/bin/env python
2  # -*- coding: utf-8 -*-
3
4  from setuptools import setup
5  from setuptools import find_packages
6
7
8  setup(
9      name='xivo-purge-db-sample-plugin',
10     version='0.0.1',
11
12     description='An example program',
13     packages=find_packages(),
14     entry_points={
15         'xivo_purge_db.archives': [
16             'sample = xivo_purge_db_sample.sample:sample_plugin',
17         ],
18     }
19 )
```

### 1.6.13 XiVO service

XiVO has many running services. To restart the whole stack, the *xivo-service* command can be used to make sure the service is restarted in the right order.

#### Usage

Show all services status:

```
xivo-service status
```

Stop XiVO services:

```
xivo-service stop
```

Start XiVO services:

```
xivo-service start
```

Restart XiVO services:

```
xivo-service restart
```

The commands above will only act upon XiVO services. Appending an argument `all` will also act upon `nginx` and `postgresql`. Example:

```
xivo-service restart all
```

UDP port 5060 will be closed while services are restarting.

### 1.6.14 XiVO auth

`xivo-auth` is a scalable, extendable and configurable authentication service. It uses an HTTP interface to emit tokens to users who can then use those tokens to identify and authenticate themselves with other services compatible with `xivo-auth`.

#### XiVO auth developer's guide

##### Architecture

`xivo-auth` contains 4 major components, an HTTP interface, a celery worker, authentication backends and a consul client. All operations are made through the HTTP interface, tokens are generated by consul as well as the persistence for some of the data attached to tokens. `xivo-auth` is only a thin layer of logic above consul. The celery worker is used to schedule tasks that outlive the lifetime of the `xivo-auth` process. Backends are used to test if a supplied username/password combination is valid and provide a unique identifier.

`xivo-auth` is made of the following modules and packages.

**plugins** the plugin package contains the `xivo-auth` backends that are packaged with `xivo-auth`.

**http** The `http` module is the implementation of the HTTP interface.

- Validate parameters
- Calls the backend to check the user authentication
- Forward instructions to the *token\_manager*
- Handle exceptions and return the appropriate `status_code`

**controller** The controller is the plumbing of `xivo-auth`, it has no business logic.

- Start the HTTP application
- Start the celery worker
- Load all enabled plugins
- Instantiate the `token_manager`

**token** The token module contains the business logic of `xivo-auth`.

- Creates and delete tokens
- Creates ACL
- Schedule token expiration
- Read/write token data to consul

**tasks** The tasks module contains implementation of celery tasks that are executed by the worker.

- Called by the celery worker
- Forwards instructions to the *token manager*

**extension** This is a place holder for a global variable for the celery app. It will be removed and should not be used.

Other modules that should not need documentation are *helpers*, *config*, *interfaces*

## Plugins

xivo-auth is meant to be easy to extend. This section describes how to add features to xivo-auth.

**Backends** xivo-auth allows its administrator to configure one or many sources of authentication. Implementing a new kind of authentication is quite simple.

1. Create a python module implementing the [backend interface](#).
2. Install the python module with an entry point *xivo\_auth.backends*

An example backend implementation is available [here](#).

## Usage

xivo-auth is used through HTTP requests, using HTTPS. Its default port is 9794. As a user, the most common operation is to get a new token. This is done with the POST method.

Alice retrieves a token using her username/password:

```
$ # Alice creates a new token, using the xivo_user backend
$ curl -k -X POST -H 'Content-Type: application/json' -u 'alice:s3cre7' "https://localhost:9497/0.1/token"
{"data": {"issued_at": "2015-06-05T10:16:58.557553", "token": "1823c1ee-6c6a-0cdc-d869-964a7f08a7"}}
```

In this example Alice used here XiVO CTI client login and password. The authentication source is determined by the backend in the POST data.

Alice could also have specified an expiration time on her POST request. The expiration value is the number of seconds before the token expires.

After retrieving her token, Alice can query other services that use xivo-auth and send her token to those service. Those services can then use this token on Alice's behalf to access her personal storage.

If Alice wants to revoke her token before its expiration:

```
$ curl -k -X DELETE -H 'Content-Type: application/json' "https://localhost:9497/0.1/token/1823c1ee-6c6a-0cdc-d869-964a7f08a7"
```

## Usage for services using xivo-auth

A service that requires authentication and identification can use xivo-auth to externalise the burden of authentication. The new service can then accept a token as part of its operations to authenticate the user using the service.

Once a service receives a token from one of its user, it will need to check the validity of that token. There are 2 forms of verification, one that only checks if the token is valid and the other returns information about this token's session if it is valid.

Checking if a token is valid:

```
$ curl -k -i -X HEAD -H 'Content-Type: application/json' "https://localhost:9497/0.1/token/1823c1ee-6c6a-0cdc-d869-964a7f08a770"
HTTP/1.1 204 NO CONTENT
Content-Type: text/html; charset=utf-8
Content-Length: 0
Date: Fri, 05 Jun 2015 14:49:50 GMT
Server: pcm-dev-0

$ # get more information about this token
$ curl -k -X GET -H 'Content-Type: application/json' "https://localhost:9497/0.1/token/1823c1ee-6c6a-0cdc-d869-964a7f08a770"
{"data": {"issued_at": "2015-06-05T10:16:58.557553", "token": "1823c1ee-6c6a-0cdc-d869-964a7f08a770"}}
```

## Launching xivo-auth

```
usage: xivo-auth [-h] [-c CONFIG_FILE] [-u USER] [-d] [-f] [-l LOG_LEVEL]

optional arguments:
  -h, --help                show this help message and exit
  -c CONFIG_FILE, --config-file CONFIG_FILE
                           The path to the config file
  -u USER, --user USER    User to run the daemon
  -d, --debug               Log debug messages
  -f, --foreground          Foreground, don't daemonize
  -l LOG_LEVEL, --log-level LOG_LEVEL
                           Logs messages with LOG_LEVEL details. Must be one of:
                           critical, error, warning, info, debug. Default: None
```

## Development

For the HTTP API see <http://api.xivo.io>. For the xivo-auth developer's see *XiVO auth developer's guide*.

### 1.6.15 XiVO dird

xivo-dird is the directory server for XiVO. It offers a simple REST interface to query all directories that are configured. xivo-dird is extendable with plugins.

## XiVO dird configuration

There are three sources of configuration for xivo-dird:

- the *command line options*
- the main configuration file
- the sources configuration directory

The command-line options have priority over the main configuration file options.

## Main Configuration File

Default location: `/etc/xivo-dird/config.yml`. Format: YAML

The default location may be overwritten by the command line options.

Here's an example of the main configuration file:

```

1 debug: False
2 foreground: False
3 log_filename: /var/log/xivo-dird.log
4 log_level: info
5 pid_filename: /var/run/xivo-dird/xivo-dird.pid
6 source_config_dir: /etc/xivo-dird/sources.d
7 user: www-data
8
9 rest_api:
10     wsgi_socket: /var/run/xivo-dird/xivo-dird.sock
11
12 enabled_plugins:
13     backends:
14         - csv
15         - ldap
16         - phonebook
17     services:
18         - lookup
19     views:
20         - aastra_xml
21         - default_json
22
23 views:
24     displays:
25         switchboard_display:
26             -
27                 title: Firstname
28                 default: Unknown
29                 field: firstname
30                 type: name
31             -
32                 title: Lastname
33                 default: Unknown
34                 field: lastname
35                 type: name
36         default_display:
37             -
38                 title: Firstname
39                 field: fn
40                 type: name
41             -
42                 title: Location
43                 default: Canada
44                 field: country
45             -
46                 title: Number
47                 field: number
48                 type: number
49     profile_to_display:
50         default: default_display
51         switchboard: switchboard_display
52
53 services:
54     lookup:
55         default:
56             sources:
57                 - my_csv
58                 - ldap_quebec
59             timeout: 0.5
60         switchboard:
61             sources:
62                 - my_csv
63                 - xivo_phonebook

```

```

64         - ldap_quebec
65         timeout: 1

```

### Root section

**debug** Enable log debug messages. Overrides `log_level`. Default: `False`.

**foreground** Foreground, don't daemonize. Default: `False`.

**log\_filename** File to write logs to. Default: `/var/log/xivo-dird.log`.

**log\_level** Logs messages with LOG\_LEVEL details. Must be one of: `critical`, `error`, `warning`, `info`, `debug`. Default: `info`.

**pid\_filename** File used as lock to avoid multiple xivo-dird instances. Default: `/var/run/xivo-dird/xivo-dird.pid`.

**source\_config\_dir** The directory from which sources configuration are read. See [Sources Configuration Directory](#). Default: `/etc/xivo-dird/sources.d`.

**user** The owner of the process. Default: `www-data`.

### rest\_api section

**wsgi\_socket** The socket used for WSGI communications (between nginx and xivo-dird). Default: `/var/run/xivo-dird/xivo-dird.sock`.

**enabled\_plugins section** This sections controls which plugins are to be loaded at xivo-dird startup. All plugin types must have at least one plugin enabled, or xivo-dird will not start. For back-end plugins, sources using a back-end plugin that is not enabled will be ignored.

### views section

**displays** A dictionary describing the content of each display. The key is the display's name, and the value are the display's content.

The display content is a list of fields. Each field is a dictionary with the following keys:

- **title**: The label of the field
- **default**: The default value of the field
- **type**: An arbitrary identifier of the field. May be used by consumers to identify the field without matching the label. For meaningful values inside XiVO, see [Integration of XiVO dird with the rest of XiVO](#).
- **field**: the key of the data from the source that will be used for this field.

The display may be used by a plugin view to configure which fields are to be presented to the consumer.

**profile\_to\_display** A dictionary associating a profile to a display. It allows xivo-dird to use the right display when a consumer makes a query with a profile. The key is the profile name and the value is the display name.

**services section** This section is a dictionary whose keys are the service plugin name and values are the configuration of that service. Hence the content of the value is dependent of the service plugin. See the documentation of the service plugin ([Stock Plugins Documentation](#)).

## Sources Configuration Directory

Default location: `/etc/xivo-dird/sources.d`. File format: YAML

Each file listed in this directory will be read and used to create a data source for xivo-dird.

Here is an example of a CSV source configuration:

```

1 type: csv
2 name: my_contacts_in_a_csv_file
3 file: /usr/local/share/my_contacts.csv
4 unique_column: id
5 searched_columns:
6     - fn
7     - ln
8 source_to_display_columns:
9     ln: lastname
10    fn: firstname
11    num: number

```

**type** The type of the source. It must be the same than the name of one of the enabled back-end plugins.

**name** The name of the source. The value is arbitrary, but it must be unique across all sources.

The other options are dependent on the source type (the back-end used). See the documentation of the back-end plugin (*Stock Plugins Documentation*). However, the following keys should be present in all source configurations:

**searched\_columns** the columns used for the lookup. Any column containing the search term substring will be a lookup result.

**source\_to\_display\_columns**: a dictionary describing the mapping between the source column name and the display field identifier.

## XiVO dird developer's guide

The XiVO dird architecture uses plugins as extension points for most of its job. It uses [stevedore](#) to do the plugin instantiation and discovery and [ABC](#) classes to define the required interface.

Plugins in xivo-dird use [setuptools](#)' entry points. That means that installing a new plugin to xivo-dird requires an entry point in the plugin's `setup.py`. Each entry point's *namespace* is documented in the appropriate documentation section. These entry points allow xivo-dird to be able to discover and load extensions packaged with xivo-dird or installed separately.

Each kind of plugin does a specific job. There are three kinds of plugins in dird.

1. *Back-End*
2. *Service*
3. *View*

All plugins are instantiated by the core. The core then keeps a catalogue of loaded extensions that can be supplied to other extensions.

The following `setup.py` shows an example of a python library that add a plugin of each kind to xivo-dird:

```

1 #!/usr/bin/env python
2 # -*- coding: utf-8 -*-
3
4 from setuptools import setup
5 from setuptools import find_packages
6
7
8 setup(
9     name='XiVO dird plugin sample',
10    version='0.0.1',

```

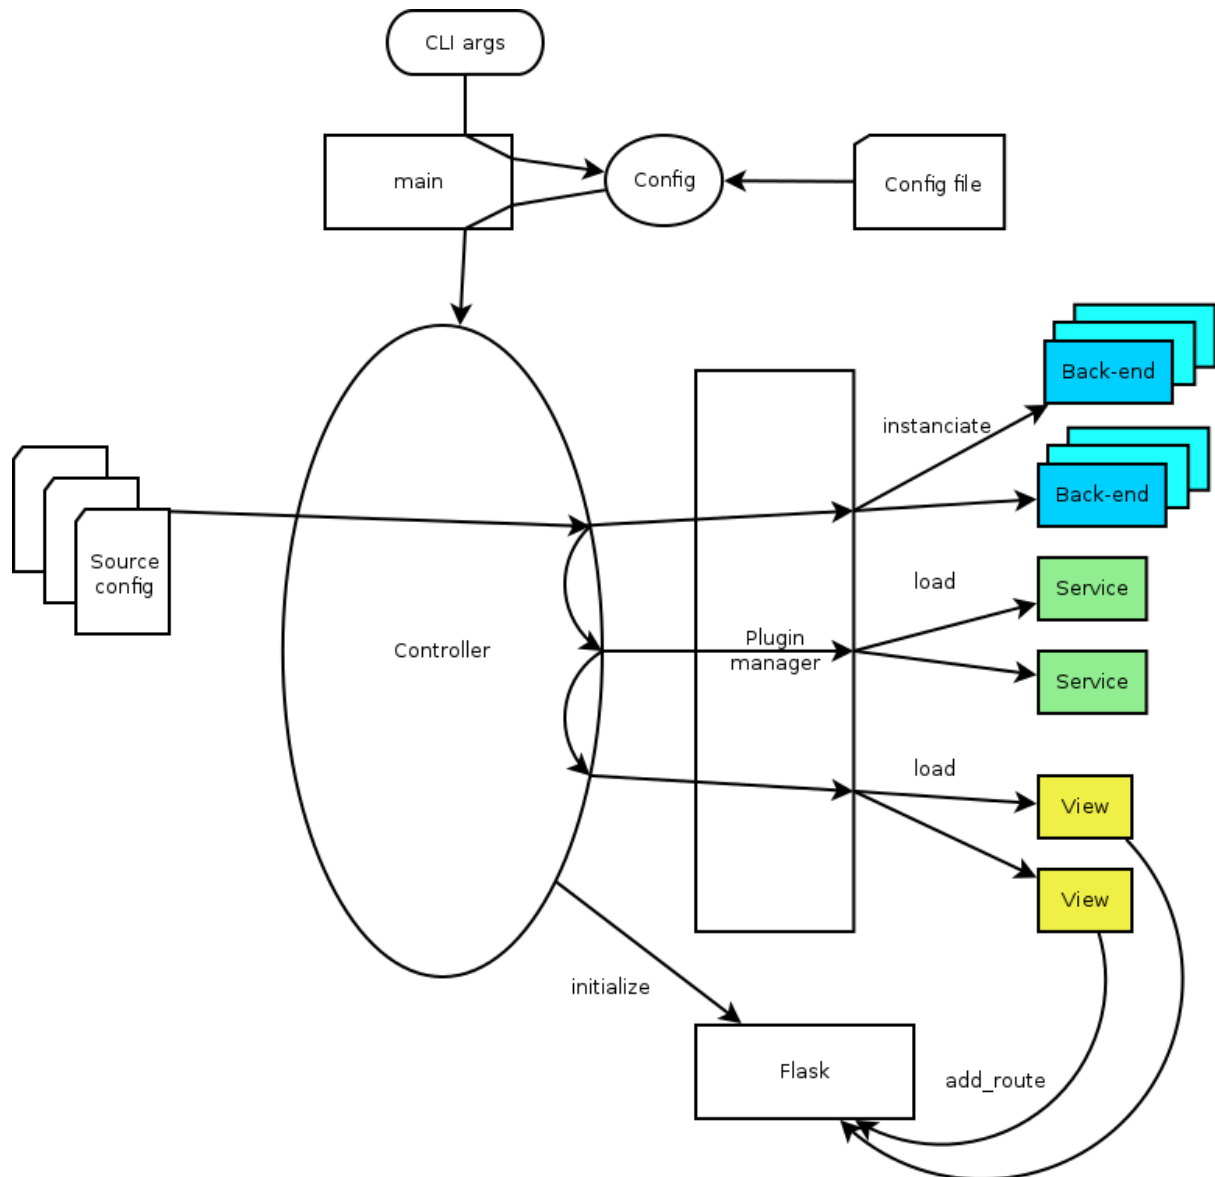

Fig. 1.26: xivo-dird startup flow

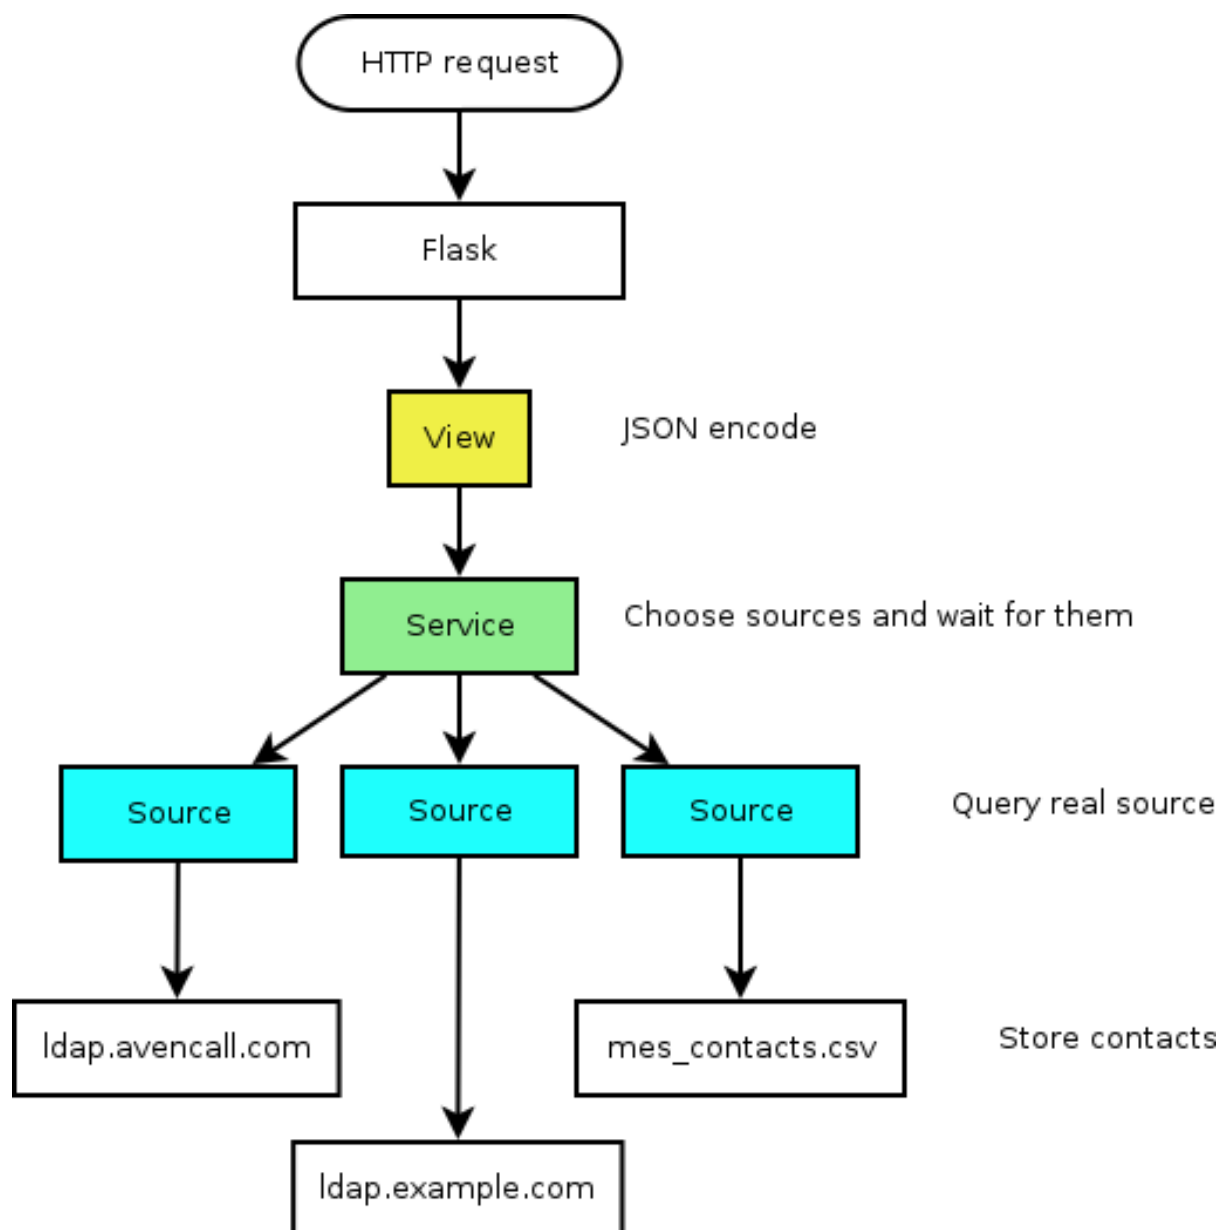

Fig. 1.27: xivo-dird HTTP query

```

11
12     description='An example program',
13
14     packages=find_packages(),
15
16     entry_points={
17         'xivo_dird.services': [
18             'my_service = dummy:DummyServicePlugin',
19         ],
20         'xivo_dird.backends': [
21             'my_backend = dummy:DummyBackend',
22         ],
23         'xivo_dird.views': [
24             'my_view = dummy:DummyView',
25         ],
26     }
27 )

```

## Back-End

Back-ends are used to query directories. Each back-end implements a way to query a given directory. Each instance of a given back-end is called a source. Sources are used by the services to get results from each configured directory.

Given one LDAP back-end, I can configure a source from the LDAP at alpha.example.com and another source from the other LDAP at beta.example.com. Both of these sources use the LDAP back-end.

## Implementation details

- Namespace: `xivo_dird.backends`
- Abstract source plugin: [BaseSourcePlugin](#)
- Methods:
  - `name`: the name of the source, typically retrieved from the configuration injected to `load()`
  - `load(args)`: set up resources used by the plugin, depending on the config. `args` is a dictionary containing:
    - \* `key config`: the source configuration for this instance of the back-end
  - `unload()`: free resources used by the plugin.
  - `search(term, args)`: The search method returns a list of dictionary.
    - \* Empty values should be `None`, instead of empty string.
  - `list(uids)`: The list method returns a list of dictionary from a list of uids. Each uid is a string identifying a contact within a source.

The typical configuration file for a given back-end will look like this:

```

1 type: <back-end name>
2 name: <source-name>
3 unique_column: id
4 search_columns:
5     - firstname
6 source_to_display_columns:
7     lastname: ln
8     firstname: fn
9     number: telephoneNumber

```

The following keys are mandatory: xivo-dird will not load the source if they are not present:

**type** the name of the back-end plugin. It should match the extension point in the setup.py

**name** is the name of this given configuration. The name is used to associate the source to profiles.

The remaining keys are conventional: they are not required by xivo-dird, but it's a good idea to use these for your configuration format.

**unique\_column** This column is what makes an entry unique in this source. The `unique_column` is used to build the `uid` that is passed to the `list` method to fetch a list of results by unique ids.

**search\_columns** This list of columns is used to try and match an entry when searching this source.

**source\_to\_display\_columns** This section is used to add column names to the result. The `search` and `list` methods *should* apply the `source_to_display_columns` transformation to the result before returning.

The implementation of the back-end should take these values into account and return results accordingly.

**Example** The following example add a backend that will return random names and number.

`dummy.py`:

```
1  # -*- coding: utf-8 -*-
2
3  import logging
4
5  logger = logging.getLogger(__name__)
6
7  class DummyBackendPlugin(object):
8
9      def name(self):
10         return 'my_local_dummy'
11
12     def load(self, args):
13         logger.info('dummy backend loaded')
14
15     def unload(self):
16         logger.info('dummy backend unloaded')
17
18     def search(self, term, args):
19         nb_results = random.randint(1, 20)
20         return _random_list(nb_results)
21
22     def list(self, unique_ids):
23         return _random_list(len(unique_ids))
24
25     def _random_list(self, nb_results):
26         columns = ['Firstname', 'Lastname', 'Number']
27         return [_random_entry(columns) for _ in xrange(nb_results)]
28
29     def _random_entry(self, columns):
30         random_stuff = [_random_string() for _ in xrange(len(columns))]
31         return dict(zip(columns, random_stuff))
32
33     def _random_string(self):
34         return ''.join(random.choice(string.lowercase) for _ in xrange(5))
```

## Service

Service plugins add new functionality to the dird server. These functionalities are available to views. When loaded, a service plugin receives its configuration and a dictionary of available sources.

Some service examples that come to mind include:

- A lookup service to search through all configured sources.
- A reverse lookup service to search through all configured sources and return a specific field of the first matching result.

### Implementation details

- Namespace: `xivo_dird.services`
- Abstract service plugin: `BaseServicePlugin`
- Abstract service: `BaseService`
- Methods:
  - `load(args)`: set up resources used by the plugin, depending on the config. `args` is a dictionary containing:
    - \* `key config`: the whole configuration file in dict form
    - \* `key sources`: a dictionary of source names to sources`load` must return a callable, which will be made available in the view plugins.
  - `unload()`: free resources used by the plugin.

**Example** The following example adds a service that will return an empty list when used.

`dummy.py`:

```

1  # -*- coding: utf-8 -*-
2
3  import logging
4
5  from xivo_dird import BaseService
6  from xivo_dird import BaseServicePlugin
7
8  logger = logging.getLogger(__name__)
9
10 class DummyServicePlugin(BaseServicePlugin):
11     """
12     This plugin is responsible for instantiating and returning the
13     DummyService. It manages its life time and should take care of
14     its cleanup if necessary
15     """
16
17     def load(self, args):
18         """
19         Ignores all provided arguments and instantiate a DummyService that
20         is returned to the core
21         """
22         logger.info('dummy loaded')
23         self._service = DummyService()
24         return self._service
25
26     def unload(self):
27         logger.info('dummy unloaded')
28
29
30 class DummyService(BaseService):
31     """
32     A very dumb service that will return an empty list every time it is used
33     """
34

```

```

35 def __call__(self):
36     return []

```

## View

View plugins add new routes to the HTTP application in xivo-dird, in particular the REST API of xivo-dird: they define the URLs to which xivo-dird will respond and the formatting of data received and sent through those URLs.

For example, we can define a REST API formatted in JSON with one view and the same API formatted in XML with another view. Supporting the directory function of a phone is generally a matter of adding a new view for the format that the phone consumes.

## Implementation details

- Namespace: `xivo_dird.views`
- Abstract view plugin: [BaseViewPlugin](#)
- Methods:
  - `load(args)`: set up resources used by the plugin, depending on the config. Typically, register routes on Flask. Those routes would typically call a service. `args` is a dictionary containing:
    - \* key `config`: the section of the configuration file for all views in dict form
    - \* key `services`: a dictionary of services, indexed by name, which may be called from a route
    - \* key `http_app`: the [Flask application](#) instance
    - \* key `rest_api`: a [Flask-RestFul Api](#) instance
  - `unload()`: free resources used by the plugin.

**Example** The following example adds a simple view: `GET /0.1/directories/ping` answers `{"message": "pong"}`.

`dummy.py`:

```

1  # -*- coding: utf-8 -*-
2
3  import logging
4
5  from flask_restful import Resource
6
7  logger = logging.getLogger(__name__)
8
9
10 class PingViewPlugin(object):
11
12     name = 'ping'
13
14     def __init__(self):
15         logger.debug('dummy view created')
16
17     def load(self, args):
18         logger.debug('dummy view args: %s', args)
19
20         args['rest_api'].add_resource(PingView, '/0.1/directories/ping')
21
22     def unload(self):
23         logger.debug('dummy view unloaded')
24
25

```

```

26 class PingView(Resource) :
27     """
28     Simple API using Flask-Restful: GET /0.1/directories/ping answers "pong"
29     """
30
31     def get(self) :
32         return {'message': 'pong'}

```

## Stock Plugins Documentation

### View Plugins

**default\_json** View name: default\_json

Purpose: present directory entries in JSON format. The format is detailed in <http://api.xivo.io>.

### Service Plugins

**lookup** Service name: lookup

Purpose: Search through multiple data sources, looking for entries matching a word.

**Configuration** Example (excerpt from the main configuration file):

```

1 services:
2     lookup:
3         default:
4             sources:
5                 - my_csv
6             timeout: 0.5

```

The configuration is a dictionary whose keys are profile names and values are configuration specific to that profile.

For each profile, the configuration keys are:

**sources** The list of source names that are to be used for the lookup

**timeout** The maximum waiting time for an answer from any source. Results from sources that take longer to answer are ignored. Default: no timeout.

**favorites** Service name: favorites

Purpose: Mark/unmark contacts as favorites and get the list of all favorites.

**Configuration** Example (excerpt from the main configuration file):

```

1 services:
2     favorites:
3         default:
4             sources:
5                 - my_csv
6             timeout: 0.5

```

The configuration is a dictionary whose keys are profile names and values are configuration specific to that profile.

For each profile, the configuration keys are:

**sources** The list of source names that are to be used for the lookup

**timeout** The maximum waiting time for an answer from any source. Results from sources that take longer to answer are ignored. Default: no timeout.

## Back-end Configuration

This sections completes the *Sources Configuration Directory* section.

**csv** Back-end name: csv

Purpose: read directory entries from a CSV file.

Limitations:

- the CSV delimiter is not configurable (currently: , (comma)).

**Configuration** Example (a file inside `source_config_dir`):

```
1 type: csv
2 name: my_csv
3 file: /var/tmp/test.csv
4 unique_column: id
5 searched_columns:
6     - fn
7     - ln
8 source_to_display_columns:
9     ln: lastname
10    fn: firstname
11    num: number
```

With the CSV file:

```
1 id,fn,ln,num
2 1,Alice,Abrams,55553783147
3 2,Bob,Benito,5551354958
4 3,Charles,Curie,5553132479
```

**file** the absolute path to the CSV file

**unique\_column** the column that contains a unique identifier of the entry. This is necessary for listing and identifying favorites.

**ldap** Back-end name: ldap

Purpose: search directory entries from an LDAP server.

**Configuration** Example (a file inside `source_config_dir`):

```
1 type: ldap
2 name: my_ldap
3 ldap_uri: ldap://example.org
4 ldap_base_dn: ou=people,dc=example,dc=org
5 ldap_username: cn=admin,dc=example,dc=org
6 ldap_password: foobar
7 unique_column: objectGUID # Active Directory
8 unique_column: entryUUID # OpenLDAP
9 searched_columns:
10     - cn
11 source_to_display_columns:
12     givenName: firstname
13     sn: lastname
14     telephoneNumber: number
```

**ldap\_uri** the URI of the LDAP server. Can only contains the scheme, host and port part of an LDAP URL.

**ldap\_base\_dn** the DN of the entry at which to start the search

**ldap\_username (optional)** the user's DN to use when performing a "simple" bind.

Default to an empty string.

When both ldap\_username and ldap\_password are empty, an anonymous bind is performed.

**ldap\_password (optional)** the password to use when performing a "simple" bind.

Default to an empty string.

**ldap\_custom\_filter (optional)** a custom LDAP filter to use when performing searches instead of searching in the column specified by the `searched_columns` option.

This must be a valid [LDAP filter](#), where the string %Q will be replaced by the (escaped) search term when performing a search.

Example: `(& (o=ACME) (cn=%Q*))`

**ldap\_network\_timeout (optional)** the maximum time, in second, that an LDAP network operation can take. If it takes more time than that, no result is returned.

Defaults to 0.1.

**ldap\_timeout (optional)** the maximum time, in second, that an LDAP operation can take.

Defaults to 1.0.

**unique\_column (optional)** the column that contains a unique identifier of the entry. This is necessary for listing and identifying favorites.

**phonebook** Back-end name: phonebook

Purpose: search directory entries from a XiVO *phone book*.

**Configuration** Example (a file inside `source_config_dir`):

```

1 type: phonebook
2 name: my_phonebook
3 phonebook_url: https://example.org/service/ipbx/json.php/restricted/pbx_services/phonebook
4 phonebook_username: admin
5 phonebook_password: foobar
6 source_to_display_columns:
7     phonebook.firstname: firstname
8     phonebook.lastname: lastname
9     phonebooknumber.office.number: number

```

**phonebook\_url (optional)** the phonebook's URL.

Default to `http://localhost/service/ipbx/json.php/private/pbx_services/phonebook`.

The URL to use differs depending on if you are accessing the phone book locally or remotely:

- Local: `http://localhost/service/ipbx/json.php/private/pbx_services/phonebook`
- Remote: `https://example.org/service/ipbx/json.php/restricted/pbx_services/phonebook`

**phonebook\_username (optional)** the username to use in HTTP requests.

No HTTP authentication is tried when phonebook\_username or phonebook\_password are empty.

**phonebook\_password (optional)** the password to use in HTTP requests.

**phonebook\_timeout (optional)** the HTTP request timeout, in seconds.

Defaults to 1.0.

To be able to access the phone book of a remote XiVO, you must create a web services access user (*Configuration -> Web Services Access*) on the remote XiVO.

The source fields that can be used in `source_to_display_columns` are those described in [this section](#).

**xivo** Back-end name: xivo

Purpose: add users from a XiVO (may be remote) as directory entries

**Configuration** Example (a file inside `source_config_dir`):

```
1 type: xivo
2 name: my_xivo
3 confd_config:
4     https: True
5     host: xivo.example.com
6     port: 9486
7     version: 1.1
8     username: admin
9     password: password
10    timeout: 3
11 unique_column: id
12 searched_columns:
13     - firstname
14     - lastname
15 source_to_display_columns:
16     exten: number
17     mobile_phone_number: mobile
```

**confd\_config:host** the hostname of the XiVO (more precisely, of the xivo-confd service)

**confd\_config:port** the port of the xivo-confd service (usually 9486)

**confd\_config:version** the version of the xivo-confd API (should be 1.1)

## Integration of XiVO dird with the rest of XiVO

### Configuration values

**Views** In the *main configuration file* of xivo-dird in the `views` section, the following keys are interpreted and displayed in xlet people of the XiVO Client:

**title** The `title` will be shown as a header for the column

#### **type**

- **agent**: the field value will be ignored and replaced by an icon showing the status of the agent assigned to the contact (e.g. green icon for logged agent, red icon for unlogged agent, ...)
- **favorite**: the boolean field value will be replaced by an icon showing if the status is favorite (yellow star filled) or not (yellow star empty).
- **mobile**: a dropdown action on the `number` field will be added to call the field value. Currently, only the last `mobile` field will be displayed.
- **name**: a decoration will be added to the field value (typically a color dot) showing the presence status of the contact (e.g. Disconnected, Available, Away, ...)
- **number**: the field value will be:
  - added a decoration (typically a color dot) showing the status of the phone of the contact (e.g. Offline, Ringing, Talking, ...)
  - replaced with a button to call the contact with your phone when using the mouse

## Launching xivo-dird

```
usage: xivo-dird [-h] [-c CONFIG_FILE] [-d] [-f] [-l LOG_LEVEL] [-u USER]

optional arguments:
  -h, --help            show this help message and exit
  -c CONFIG_FILE, --config-file CONFIG_FILE
                        The path where is the config file. Default: /etc/xivo-dird/config.yml
  -d, --debug           Log debug messages. Overrides log_level. Default:
                        False
  -f, --foreground      Foreground, don't daemonize. Default: False
  -l LOG_LEVEL, --log-level LOG_LEVEL
                        Logs messages with LOG_LEVEL details. Must be one of:
                        critical, error, warning, info, debug. Default: info
  -u USER, --user USER The owner of the process.
```

## Terminology

### Back-end

A back-end is a connector to query a specific type of directory, e.g. one back-end to query LDAP servers, another back-end to query CSV files, etc.

### Source

A source is an instance of a back-end. One backend may be used multiples times to query multiple directories of the same type. For example, I could have the customer-csv and the employee-csv sources, each using the CSV back-end, but reading a different file.

### Plugins

A plugin is an extension point in xivo-dird. It is a way to add or modify the functionality of xivo-dird. There are currently three types of plugins:

- Back-ends to query different types of directories (LDAP, CSV, etc.)
- Services to provide different directory actions (lookup, reverse lookup, etc.)
- Views to expose directory results in different formats (JSON, XML, etc.)

### API

See <http://api.xivo.io>, section XiVO Dird.

## 1.6.16 XiVO sysconfd

xivo-sysconfd is the system configuration server for XiVO. It does quite a few different things; here's a non exhaustive list:

- configuring network (interfaces, hostname, DNS)
- configuring high availability
- starting/stopping/restarting services
- reloading asterisk configuration
- sending some events to components (xivo-agentd, xivo-agid and xivo-ctid)

## Configuration File

Default location: `/etc/xivo/sysconfd.conf`. Format: INI.

The default location may be overwritten by the command line options.

Here's an example of the configuration file:

```
[general]
xivo_config_path = /etc/xivo
templates_path = /usr/share/xivo-sysconfd/templates
custom_templates_path = /etc/xivo/sysconfd/custom-templates
backup_path = /var/backups/xivo-sysconfd

[resolveconf]
hostname_file = /etc/hostname
hostname_update_cmd = /etc/init.d/hostname.sh start
hosts_file = /etc/hosts
resolveconf_file = /etc/resolve.conf

[network]
interfaces_file = /etc/network/interfaces

[wizard]
templates_path = /usr/share/xivo-config/templates
custom_templates_path = /etc/xivo/custom-templates

[commonconf]
commonconf_file = /etc/xivo/common.conf
commonconf_cmd = /usr/sbin/xivo-update-config
commonconf_monit = /usr/sbin/xivo-monitoring-update

[openssl]
certsdir = /var/lib/xivo/certificates

[monit]
monit_checks_dir = /usr/share/xivo-monitoring/checks
monit_conf_dir = /etc/monit/conf.d

[request_handlers]
synchronous = true

[bus]
username = guest
password = guest
host = localhost
port = 5672
exchange_name = xivo
exchange_type = topic
exchange_durable = true
```

### request\_handlers section

**synchronous** If this option is true, when xivo-sysconfd receives a request to reload the dialplan for example, it will wait for the dialplan reload to complete before replying to the request.

When this option is false, xivo-sysconfd reply to the request immediately.

Setting this option to false will speed up some operation (for example, editing a user from the web interface or from xivo-confd), but this means that there will be a small delay (up to a few seconds in the worst case) between the time you create your user and the time you can dial successfully its extension.

## 1.7 Ecosystem

### 1.7.1 Devices

In XiVO, there is two kind of devices:

#### Officially Supported Devices

The officially supported devices will be supported across upgrades and phone features are guaranteed to be supported on the latest version.

`xivo-provd` plugins for these devices can be installed from the “*officially supported devices*” repository.

For best results, activate *DHCP Integration* on your XiVO.

These devices can be used to connect faxes. For better success with faxes some parameters must be changed. You can read the *Using analog gateways* section.

To install the firmware for the Cisco SPA122, you need to manually download the firmware file from the Cisco website and save them in the `/var/lib/xivo-provd/plugins/$plugin-name/var/cache` directory.

For example, if you have installed the `xivo-cisco-spa100-1.3.5` plugin and you want to install the `spa100-fw` package, you must:

- Go to <http://www.cisco.com/c/en/us/support/unified-communications/spa122-ata-router/model.html>
- Click on “Downloads” tab
- Download the Analog Telephone Adaptor (ATA) Firmware, version 1.3.5 (XU).
- Copy the downloaded file on your XiVO, in the `/var/lib/xivo-provd/plugins/xivo-cisco-spa100-1.3.5/` directory.
- In the XiVO web interface, you’ll then be able to click on the “install” button for the firmware

**Note:** If you want to manually resynchronize the configuration from the ATA device you should use the following url:

```
http://ATA_IP/admin/resync?http://XIVO_IP:8667/CONF_FILE
```

where :

- *ATA\_IP* is the IP address of the ATA,
- *XIVO\_IP* is the IP address of your XiVO,
- *CONF\_FILE* is one of `spa3102.cfg`, `spa8000.cfg`

## Cisco 7900 Series

**Warning:** These phones can only be used in SCCP mode. They are limited to the *features supported in XIVO's SCCP implementation*.

To install firmware for xivo-cisco-sccp plugins, you need to manually download the firmware files from the Cisco website and save them in the `/var/lib/xivo-provd/plugins/$plugin-name/var/cache` directory.

This directory is created by XiVO when you install the plugin (i.e. xivo-cisco-sccp-legacy). If you create the directory manually, the installation will fail.

<sup>1</sup>These devices are marked as Not Tested because other similar models using the same firmware have been tested instead. If these devices ever present any bugs, they will be troubleshooted by the XiVO support team.

**Warning:** Access to Cisco firmware updates requires a Cisco account with sufficient privileges. The account requires paying for the service and remains under the responsibility of the client or partner. Avencall is not responsible for these firmwares and does not offer any updates.

For example, if you have installed the `xivo-cisco-sccp-legacy` plugin and you want to install the `7940-7960-fw, networklocale` and `userlocale_fr_FR` package, you must:

- Go to <http://www.cisco.com>
- Click on “Log In” in the top right corner of the page, and then log in
- Click on the “Support” menu
- Click on the “Downloads” tab, then on “Voice & Unified Communications”
- Select “IP Telephony”, then “Unified Communications Endpoints”, then the model of your phone (in this example, the 7940G)
- Click on “Skinny Client Control Protocol (SCCP) software”
- Choose the same version as the one shown in the plugin
- Download the file with an extension ending in “.zip”, which is usually the last file in the list
- In the XiVO web interface, you’ll then be able to click on the “install” button for the firmware

The procedure is similar for the network locale and the user locale package, but:

- Instead of clicking on “Skinny Client Control Protocol (SCCP) software”, click on “Unified Communications Manager Endpoints Locale Installer”
- Click on “Linux”
- Choose the same version of the one shown in the plugin
- For the network locale, download the file named “po-locale-combined-network.cop.sgn”
- For the user locale, download the file named “po-locale-\$locale-name.cop.sgn, for example “po-locale-fr\_FR.cop.sgn” for the “fr\_FR” locale
- Both files must be placed in `/var/lib/xivo-provd/plugins/$plugin-name/var/cache` directory. Then install them in the XiVO Web Interface.

**Note:** Currently user and network locale 9.0.2 should be used for plugins `xivo-sccp-legacy` and `xivo-cisco-sccp-9.0.3`

Parking	N	NYT	N
Parking position	N	NYT	N
<b>Paging Functions</b>			
Paging	Y	NYT	Y

**Note:** Some function keys are shared with line keys

Particularities:

- For best results, activate *DHCP Integration* on your XiVO.
- Impossible to do directed pickup using a BLF function key.
- Only supports DTMF in RFC2833 mode.
- Does not work reliably with Cisco ESW520 PoE switch. When connected to such a switch, the D40 tends to reboot randomly, and the D70 does not boot at all.
- It's important to not edit the phone configuration via the phones' web interface when using these phones with XiVO.
- Paging doesn't work.

Particularities:

- For directed call pickup to work via the BLF function keys, you need to make sure that the option *Set caller-id in dialog-info+xml notify* is enabled on your XiVO. This option is located on the *Services → IPBX → General settings → SIP Protocol* page, in the *Signaling* tab.

Also, directed call pickup via a BLF function key will not work if the extension number of the supervised user is different from its caller ID number.

**Note:** (XiVO HA cluster) BLF function key saved on the master node are not available.

Supported expansion modules:

- Polycom® VVX Color Expansion (for Polycom® VVX 300/310/400/410/500/600)

- Polycom® VVX Paper Expansion (for Polycom® VVX 300/310/400/410/500/600)
- Polycom® SoundPoint IP Backlit (for Polycom® SoundPoint 650)

**Warning:** Polycom® VVX® Camera are not supported.

Supported expansion modules:

- Snom® Vision (for Snom® 7xx series and Snom® 8xx series)

- Snom® D7 (for Snom® 7xx series)

**Note:** For some models, function keys are shared with line keys

There's the following known limitations/issues with the provisioning of Snom phones in XiVO:

- If you are using Snom phones with [HA](#), you should not assign multiple lines to the same device.
- When using a D7 expansion module, the function key label will not be shown on the first reboot or resynchronization. You'll need to reboot or resynchronize the phone a second time for the label to be shown properly.
- After a factory reset of a phone, if no language and timezone are set for the “default config device” in XiVO → *Configuration* → *Provisioning* → *Template device*, you will be forced to select a default language and timezone on the phone UI.

Regarding the W52P (DECT), there is firmware for both the base station and the handset. The base and the handset are [probably going to work if they are not using the same firmware version](#), although this does not seem to be officially recommended. By default, a base station will try to upgrade the firmware of an handset over the air (OTA) if the following conditions are met:

- Handset with firmware 26.40.0.15 or later
- Base station with firmware 25.40.0.15 or later
- Handset with hardware 26.0.0.6 or later

Otherwise, you'll have to manually upgrade the handset firmware via USB.

In all cases, you should consult the Yealink documentation on [Upgrading W52x Handset Firmware](#).

---

**Note:** Some function keys are shared with line keys

---

Supported expansion modules:

- Yealink® EXP38 (for Yealink® T26P/T28P)
- Yealink® EXP39 (for Yealink® T26P/T28P)
- Yealink® EXP40 (for Yealink® T46G/T48)

Caption :

## Community Supported Devices

The community supported devices are only supported by the community. In other words, maintenance, bug, corrections and features are developed by members of the XiVO community. XiVO does not officially endorse support for these devices.

xivo-provd plugins for these devices can be installed from the *“community supported devices” repository*.

## Aastra

6700i and 9000i series:

Model	Tested <sup>1</sup>	Fkeys <sup>2</sup>	XiVO HA <sup>3</sup>
6730i	No	8	Yes
6753i	Yes	6	Yes
6757i	Yes	30	Yes
9143i	Yes	7	Yes
9480i	No	6	Yes
9480CT	No	6	Yes

<sup>1</sup>Tested means the device has been tested by the XiVO development team and that the developers have access to this device.

<sup>2</sup>Fkeys is the number of programmable function keys that you can configure from the XiVO web interface. It is not necessarily the same as the number of physical function keys the device has (for example, a 6757i has 12 physical keys but you can configure 30 function keys because of the page system).

<sup>3</sup>XiVO HA means the device is confirmed to work with *XiVO HA*.

## Alcatel-Lucent

IP Touch series:

Model	Tested <sup>1</sup>	Fkeys <sup>2</sup>	XiVO HA <sup>3</sup>
4008 Extended Edition	Yes	4	No
4018 Extended Edition	Yes	4	No

Note that you *must not* download the firmware for these phones unless you agree to the fact it comes from a non-official source.

For the plugin to work fully, you need these additional packages:

```
apt-get install p7zip python-pexpect telnet
```

## Avaya

1200 series IP Deskphones (previously known as Nortel IP Phones):

Model	Tested <sup>1</sup>	Fkeys <sup>2</sup>	XiVO HA <sup>3</sup>
1220 IP	Yes	0	No
1230 IP	No	0	No

## Cisco

Cisco Small Business SPA300 series:

Model	Tested <sup>1</sup>	Fkeys <sup>2</sup>	XiVO HA <sup>3</sup>
SPA301	No	1	No
SPA303	No	3	No

---

**Note:** Function keys are shared with line keys for all SPA phones

---

Cisco Small Business SPA500 series:

Model	Tested <sup>1</sup>	Fkeys <sup>2</sup>	XiVO HA <sup>3</sup>
SPA501G	Yes	8	No
SPA502G	No	1	No
SPA504G	Yes	4	No
SPA508G	Yes	8	No
SPA509G	No	12	No
SPA512G	No	1	No
SPA514G	No	4	No
SPA525G	Yes	5	No
SPA525G2	No	5	No

The SPA500 expansion module is supported.

Cisco Small Business IP Phones (previously known as Linksys IP Phones)

Model	Tested <sup>1</sup>	Fkeys <sup>2</sup>	XiVO HA <sup>3</sup>
SPA901	No	1	No
SPA921	No	1	No
SPA922	No	1	No
SPA941	No	4	No
SPA942	Yes	4	No
SPA962	Yes	6	No

---

**Note:** You must install the firmware of each SPA9xx phones you are using since they reboot in loop when they can't find their firmware.

---

The SPA932 expansion module is supported.

ATAs:

Model	Tested <sup>1</sup>	Fkeys <sup>2</sup>	XiVO HA <sup>3</sup>
PAP2	No	0	No
SPA2102	No	0	No
SPA8800	No	0	No
SPA112	No	0	No

For best results, activate *DHCP Integration* on your XiVO.

---

**Note:** These devices can be used to connect Faxes. For better success with faxes some parameters must be changed. You can read the *Using analog gateways* section.

---

---

**Note:** If you want to manually resynchronize the configuration from the ATA device you should use the following url:

```
http://ATA_IP/admin/resync?http://XIVO_IP:8667/CONF_FILE
```

where :

- *ATA\_IP* is the IP address of the ATA,
  - *XIVO\_IP* is the IP address of your XiVO,
  - *CONF\_FILE* is one of *spa2102.cfg*, *spa8000.cfg*
- 

## Fanvil

Model	Tested <sup>1</sup>	Fkeys <sup>2</sup>	XiVO HA <sup>3</sup>
C62P	Yes	5	Yes

## Gigaset

Also known as Siemens.

Model	Tested <sup>1</sup>	Fkeys <sup>2</sup>	XiVO HA <sup>3</sup>
C470 IP	No	0	No
C475 IP	No	0	No
C590 IP	No	0	No
C595 IP	No	0	No
C610 IP	No	0	No
C610A IP	No	0	No
S675 IP	No	0	No
S685 IP	No	0	No
N300 IP	No	0	No
N300A IP	No	0	No
N510 IP PRO	No	0	No

## Jitsi

Model	Tested <sup>1</sup>	Fkeys <sup>2</sup>	XiVO HA <sup>3</sup>
Jitsi	Yes	—	No

## Panasonic

Panasonic KX-HTXXX series:

Model	Tested <sup>1</sup>	Fkeys <sup>2</sup>	XiVO HA <sup>3</sup>
KX-HT113	No	—	No
KX-HT123	No	—	No
KX-HT133	No	—	No
KX-HT136	No	—	No

**Note:** This phone is for testing for the moment

---

## Polycom

Model	Tested <sup>1</sup>	Fkeys <sup>2</sup>	XiVO HA <sup>3</sup>
SPIP320	No	0	No
SPIP321	No	0	No
SPIP330	No	0	No
SPIP430	No	0	No
SPIP501	Yes	0	No
SPIP600	No	0	No
SPIP601	No	0	No
SPIP670	No	47	No

SoundStation IP:

Model	Tested <sup>1</sup>	Fkeys <sup>2</sup>	XiVO HA <sup>3</sup>
SPIP4000	No	0	No

Others:

Model	Tested <sup>1</sup>	Fkeys <sup>2</sup>	XiVO HA <sup>3</sup>
VVX1500	No	0	No

## Snom

Model	Tested <sup>1</sup>	Fkeys <sup>2</sup>	XiVO HA <sup>3</sup>
300	No	6	Yes
320	Yes	12	Yes
360	No	—	Yes
820	Yes	4	Yes
MP	No	—	Yes
PA1	No	0	Yes

**Note:** For some models, function keys are shared with line keys

---

**Warning:** If you are using Snom phones with HA, you should not assign multiple lines to the same device.

There's a known issue with the provisioning of Snom phones in XiVO:

- After a factory reset of a phone, if no language and timezone are set for the “default config device” in *XiVO* → *Configuration* → *Provisioning* → *Template device*, you will be forced to select a default language and timezone on the phone UI.

## Technicolor

Previously known as Thomson:

Model	Tested <sup>1</sup>	Fkeys <sup>2</sup>	XiVO HA <sup>3</sup>
ST2022	No	—	No
ST2030	Yes	10	No

**Note:** Function keys are shared with line keys

## Yealink

Model	Tested <sup>1</sup>	Fkeys <sup>2</sup>	XiVO HA <sup>3</sup>
T20P	No	2	No
T26P	No	13	No

**Note:** Some function keys are shared with line keys

## Zenitel

Model	Tested <sup>1</sup>	Fkeys <sup>2</sup>	XiVO HA <sup>3</sup>
IP station	Yes	1	No

The officially supported devices will be supported across upgrades and phone features are guaranteed to be supported on the latest version.

The community supported devices are only supported by the community. In other words, maintenance, bug, corrections and features are developed by members of the XiVO community. XiVO does not officially endorse support for these devices.

The next topics lists the officially and community supported devices. For each vendor, a table shows the various features supported by XiVO. Here’s an example:

	Model X	Model Y	Model Z
Provisioning	Y	Y	Y
H-A	Y	Y	Y
Directory XiVO	N	Y	Y
Funckeys	0	2	8
	<b>Supported programmable keys</b>		
User with supervision function	Y	Y	Y

The rows have the following meaning:

**Provisioning** Is the device supported by the *auto-provisioning* system ?

**H-A** Is the device supported by the *high availability* system ?

**Directory XiVO** Is the device supported by the *remote directory* ? In other word, is it possible to consult the XiVO’s remote directory from the device ?

**Funckeys** How many function keys can be configured on the device from the XiVO web interface ?

The number of function keys that can be configured on a device is not necessarily the same as the number of physical function keys the device has. For example, an Aastra 6757i has 12 physical keys but you can configure 30 function keys because of the page system.

Inside a table, the following legend is used:

- Y = Yes / Supported
- N = No / Not supported
- NT = Not tested
- NYT = Not yet tested

Each table also contains a section about the supported function keys. In that section, the following legend can also be used:

- FK = Funckey
- SK = SoftKey
- HK = HardKey
- MN = Menu

Function keys work using the extensions in *Services* → *Extensions*. It is important to enable the function keys you want to use. Also, the enable transfer option in the user configuration services tab must be enabled to use transfer function keys.

## 1.8 Administration

### 1.8.1 Advanced Configuration

This section describes the advanced system configuration.

#### XiVO General Settings

XiVO offers the possibility to configure the general settings via the *Configuration* → *Management* → *General* page.

Fig. 1.28: Configure XiVO General Settings

Live reload configuration permit to reload its configuration on command received from WEBI (this option is enabled by default).

#### Telephony certificates

XiVO offers the possibility to create and manage X.509 certificates via the the *Configuration* → *Management* → *Certificates* page.

These certificates can be used for:

- enabling SIP TLS
- enabling encryption between the CTI server and the XiVO clients

For the certificate used for HTTPS, see [HTTPS certificate](#).

## Creating certificates

You can add a certificate by clicking on the add button at the top right of the page. You'll then be shown this page:

Fig. 1.29: Adding a certificate

You should look at the *examples* if you don't know which attributes to set when creating your certificates.

## Removing certificates

When removing a certificate, you should remove all the files related to that certificates.

**Warning:** If you remove a certificate that is used somewhere in XiVO, then you need to manually reconfigure that portion of XiVO.

For example, if you remove the certificate files used for SIP TLS, then you need to manually disable SIP TLS or asterisk will look for certificate file but it won't be able to find them.

## Examples

In the following examples, if a field is not specified than you should leave it at its default value.

**Creating certificates for SIP TLS** You need to create both a CA certificate and a server certificate.

CA certificate:

- *Name* : phones-CA
- *Certification authority (checkbox)* : checked
- *Autosigned* : checked
- *Valid end date* : at least one month in the future
- *Common name* : the FQDN (Fully Qualified Domain Name) of your XiVO
- *Organization* : your organization's name, or blank

- *Email* : your email or organization's email

Server certificate:

- *Name* : phones
- *Certification authority (select)* : phones-CA
- *Valid end date* : at least one month in the future
- *Common name* : the FQDN of your XiVO
- *Organization* : your organization's name, or blank
- *Email* : your email or organization's email

#### Creating certificate for CTI server

- *Name* : xivo-ctid
- *Autosigned* : checked
- *Valid end date* : at least one month in the future
- *Common name* : the FQDN of your XiVO
- *Organization* : your organization's name, or blank
- *Email* : your email or organization's email

<p><b>Warning:</b> You must <i>not</i> set a password for the certificate. If the certificate is password protected, the CTI server will not be able to use it.</p>
---

## LDAP

XiVO offers the possibility to integrate LDAP servers. Once configured properly, you'll be able to search your LDAP servers directly from your phones (if they support this feature).

---

**Note:** This page describes how to add LDAP servers as sources of contacts. For other sources of contacts, see *Phonebook*, and *Directories*.

---

### Add a LDAP Server

You can add a LDAP server by clicking on the add button at the top right corner of the *Configuration* → *Management* → *LDAP Servers* page. You'll then be shown this page:

Enter the following information:

- Name: the server's display name
- Host: the hostname or IP address
- Port: the port number (default: 389)
- Security layer: select SSL if it is activated on your server and you want to use it (default: disabled)
  - SSL means TLS/SSL (doesn't mean StartTLS) and port 636 should then be used
- Protocol version: the LDAP protocol version (default: 3)

<p><b>Warning:</b> When editing an LDAP server, you'll have to restart the CTI server for the changes to be taken into account.</p>
---

Fig. 1.30: Adding a LDAP server

**Notes on SSL/TLS usage** If you are using SSL with an LDAP server that is using a CA certificate from an unknown certificate authority, you'll have to put the certificate file as a single file ending with `.crt` into `/usr/local/share/ca-certificates` and run `update-ca-certificates`.

You also need to make sure that the `/etc/ldap/ldap.conf` file contains a line `TLS_CACERT /etc/ssl/certs/ca-certificates.crt`.

After that, restart `spawn-fcgi` with `/etc/init.d/spawn-fcgi restart`.

Also, make sure to use the FQDN of the server in the host field when using SSL. The host field must match exactly what's in the CN attribute of the server certificate.

### Add a LDAP Filter

Next thing to do after adding a LDAP server is to create a LDAP filter via the *Services → IPBX configuration → LDAP Filters* page.

LDAP filters define the information that will be searched and displayed when you do a directory search.

You can add a LDAP filter by clicking on the add button at the top right of the page. You'll then be shown this page:

Enter the following information:

- Name: the filter's display name
- LDAP server: the LDAP server this filter applies to
- User: the dn of the user used to do search requests
- Password: the password of the given user
- Base DN: the base dn of search requests
- Filter: if specified, *it replace the default filter*
- Phone number type: this string is appended next to each result display name

**LDAP filters > Edit**

Name:

LDAP Server:  ▼

User:

Password:

Base DN:

Filter:

Phone number type:  ▼

Description:

Fig. 1.31: Adding a LDAP Filter

You'll also probably need to modify some values in the *Attributes* tab:

The screenshot shows the 'LDAP filters > Edit' window with the 'Attributes' tab selected. There are two sections: 'Display name' and 'Phone number'. Each section contains a list box. In the 'Display name' list, 'cn' is the first item. In the 'Phone number' list, 'telephoneNumber' is the first item. To the left of each list box are a '+' icon (to add) and an 'x' icon (to remove). To the right are up and down arrow icons (to reorder). At the bottom of the window is a 'Save' button.

Fig. 1.32: Adding a LDAP Filter

In the *Display name* section, add and order the attributes that are going be used to display the results. The first attribute will be used for each result which have this attribute, else the second will be used, etc.

The *Phone number* section is similar, but is used for the phone number in the results.

**Use a Custom Filter** In some cases, you might have to use a custom filter for your search requests instead of the default filter.

By default, the search tries to match any attribute you choose in the *Attributes* tab.

In custom filters, occurrence of the pattern %Q is replaced by what the user entered on its phone.

Here's some examples of custom filters:

- `cn=%Q*`
- `& (cn=%Q*) (mail=%Q@example.org)`
- `| (cn=%Q*) (displayName=%Q*)`

### Add a LDAP filter to the Phonebook

In the *Services* → *General settings* → *Phonebook* page, click on the *LDAP filters* page and add your filter to the list of enabled filters.

Please refer to the [Remote directory](#) section in order to properly configure a remote directory.

You'll then be able to search your LDAP server directly from your phone and dial from the displayed results.

## Use with CTI Server and Client XiVO

**Add a LDAP Directory Filter to the CTI Server** In the *Services* → *CTI Server* → *Directories* → *Definitions* page, click on the add button

Fieldname	Value
lastname	sn
phone	telephoneNumber
mail	email
firstname	givenName
fullname	cn

Fig. 1.33: Adding a directory LDAP Filter to CTI Server

- Direct match use to search into this field
- Match reverse directory use to search into this field for the reverse directory
- Fieldname/value match to the CTI field> server> | field> LDAP> server.

**Add a LDAP Directory to the CTI Server** In the *Services* → *CTI Server* → *Directories* → *Direct directories* page, click on the edit button for default directory

To use this directory, you must then add to the list of searchable directories.

Fig. 1.34: Adding a directory LDAP to CTI Server

**Warning:** The CTI server settings resonates in contexts. This means creating a context for each CTI context of membership of your users who will examine the “Directories”.

- eg: CTI Context default for users in context default

Restart CTI Server

## 1.8.2 Boss Secretary Filter

The boss secretary filter allow to set a secretary or a boss role to a user. Filters can then be created to filter calls directed to a boss using different strategies.

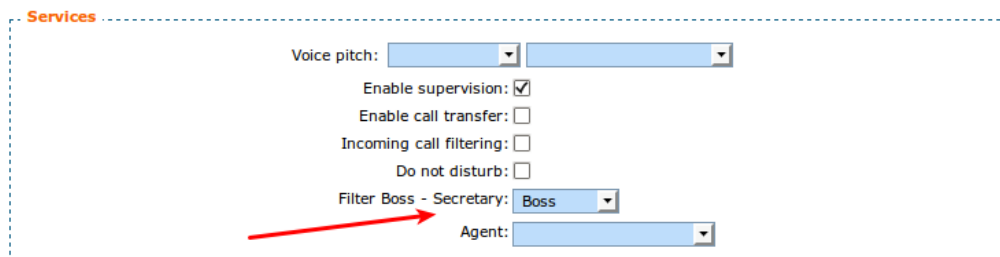

### Quick Summary

**In order to be able to use the boss secretary filter you have to :**

- Select a boss role for one the users
- Select a secretary role for one of the users
- Create a filter to set a strategy for this boss secretary filter
- Add a function key for the user boss and the user secretary

### Defining a Role

The secretary or boss role can be set in the user’s configuration page under the service tab. To use this feature, at least one boss and one secretary must be defined.

### Creating a Filter

The filter is used to associate a boss to one or many secretaries and to set a ring strategy. The call filter is added in the *Services → IPBX → Call management → Call filters* page.

**Different ringing strategies can be applied :**

- Boss rings first then all secretaries one by one
- Boss rings first then secretaries are all ringing simultaneously
- Secretaries ring one by one
- Secretaries are all ringing simultaneously
- Boss and secretaries are ringing simultaneously
- Change the caller id if the secretary wants to know which boss was initially called

When one of serial strategies is used, the first secretary called is the last in the list. The order can be modified by drag and drop in the list.

7

Name:

Context:

Call from:

Mode:

CallerID mode :

Identity:

Ringing time:

Items selected	Remove all	Add all
		Jean-Yves LEBLEU +

## Usage

The call filter function can be activated and deactivated by the boss or the secretary using the \*37 extension. The extension is defined in *IPBX services > Extensions*.

The call filter has to be activated for each secretary if more than one is defined for a given boss.

The extension to use is \*37<callfilter member id>.

In this example, you would set 2 Func Keys \*373 and \*374 on the Boss.

On the secretary Jina LaPlante you would set \*373.

On the secretary Ptit Nouveau you would set \*374.

Secretary

2 items selected	Remove all	Add all
Jina LaPlante (*373)	-	John Smith +
Ptit Nouveau (*374)	-	

## Function Keys

A more convenient way to active the boss secretary filter is to assign a function key on the boss' phone or the secretary's phone. In the user's configuration under `Func Keys`. A function key can be added for each secretaries of a boss.

If supervision is activated, the key will light up when filter is activated for this secretary. If a secretary also has a function key on the same boss/secretary combination the function key's BLF will be in sync between each phones.

**Warning:** With SCCP phones, you must configure a custom `Func Keys`.

### 1.8.3 Call Completion

The call completion feature (or CCSS, for Call Completion Supplementary Services) in XiVO allows for a caller to be automatically called back when a called party has become available.

1. To illustrate, let's say Alice attempts to call Bob.
2. Bob is currently on a phone call with Carol, though, so Bob rejects the call from Alice, and Alice hears a message saying that Bob is busy.
3. Alice then dials \*40 to request call completion.
4. Once Bob has finished his phone call, Alice will be automatically called back by the system.
5. When she answers, Bob will be called on her behalf.

This feature has been introduced in XiVO in version 14.17.

#### Description

Call completion can be used in two scenarios:

- when the called party is busy (Call Completion on Busy Subscriber)
- when the called party doesn't answer (Call Completion on No Response)

We have already discussed the busy scenario in the introduction section.

Let's now illustrate the no answer scenario:

1. Alice attempts to call Bob.
2. Bob doesn't answer the phone. Alternatively, Alice hangs up before Bob has the time to answer the call.
3. Alice then dial \*40 to request call completion.
4. When Bob's phone becomes busy and then is no longer busy, Alice is automatically called back.
5. When she answers, Bob will be called on her behalf.

The important thing to note here is step #4. Bob's phone needs to become busy and then no longer busy for Alice to be called back. This means that if Bob was away when Alice called him, but when he came back he did not received nor placed any call, then Alice will not be called back.

In fact, in all scenarios, after call completion has been requested by the caller, the called phone needs to transition from busy to no longer busy for the caller to be called back. This means that in the following scenario:

1. Alice attempts to call Bob.
2. Bob is currently on a phone call, so he doesn't answer the call from Alice.
3. Bob finish his call a few seconds later.
4. Alice then dials \*40 to request call completion (Bob is not busy anymore).

Then, for Alice to be called back, Bob needs to become busy and then not busy.

If Alice is busy when Bob becomes not busy, then the call completion callback will only happen after both Alice and Bob are not busy.

When call completion is active, it can be cancelled by dialing the \*40 extension.

Some timers governs the use of call completion. These are:

- offer timer: the time the caller has to request call completion. Defaults to 30 (seconds).
- busy available timer: when call completion on busy subscriber is requested, if this timer expires before the called party becomes available, then the call completion attempt will be cancelled. Defaults to 900 (seconds).
- no response available timer: similar to the “busy available timer”, but when call completion on no response is requested. Defaults to 900 (seconds).
- recall timer: when the caller who requested call completion is called back, how long the original caller’s phone rings before giving up. Defaults to 30 (seconds).

It’s currently impossible to modify the value of these timers in XiVO.

## **Special Scenarios**

There are four special scenarios:

- the call completion will not activate
- the call completion will activate and call back for the original called party
- the call completion will activate and call back for the rerouted called party
- the call completion will activate and call back for the original called party but fail to join him

**Call completion will not activate** Scenario: Alice tries to call Bob, but the call is redirected to Charlie. When activating call completion, Alice hears that the call completion can not be activated.

This occurs when Bob redirects/rejects the call with any of the following:

- Unconditional call forwarding towards Charlie
- Closed schedule towards Charlie
- Call permission forbidding Alice to call Bob
- Preprocess subroutine forwarding the call towards Charlie

**Call completion will activate and call back for the original called party** Scenario: Alice tries to call Bob, but the call is redirected to Charlie. When activating call completion, Alice hears that the call completion is activated and eventually Alice is called back to speak with Bob.

This occurs when Bob redirects/rejects the call with any of the following:

- No-answer call forwarding towards Charlie
- Busy call forwarding towards Charlie

**Call completion will activate and call back for the rerouted called party** Scenario: Alice tries to call Bob, but the call is redirected to Charlie. When activating call completion, Alice hears that the call completion is activated and eventually Alice is called back to speak with Charlie.

This occurs when Bob redirects the call with any of the following:

- Boss-Secretary filter to the secretary Charlie

**Call completion will activate and call back for the original called party but fail to join him** Scenario: Alice tries to call Bob, but the call is redirected to Charlie. When activating call completion, Alice hears that the call completion is activated and eventually Alice is called back to speak with Bob. But when Alice answers, Bob is not called. If Alice activates call completion again, she will hear that the call completion was cancelled.

This occurs when Bob redirects/rejects the call with any of the following:

- Do Not Disturb mode
- a new call forwarding rule that was applied after Alice activated call completion:
  - Unconditional call forwarding towards Charlie
  - Closed schedule towards Charlie
  - Call permission forbidding Alice to call Bob
  - Preprocess subroutine forwarding the call towards Charlie

### Limitations

- Call completion can only be used with SIP lines. It can't be used with SCCP lines.
- It can't be used with outgoing calls and incoming calls, except if these calls are passing through a customized trunk of type Local.
- It can't be used with groups or queues.
- The call completion feature can't be enabled only for a few users; either all users have access to it, or none.

### Configuration

The call completion extension is enabled via the *Services* → *IPBX* → *IPBX services* → *Extensions* page, in the *General* tab.

Fig. 1.35: Call Completion Extension

If your XiVO has been installed in version 14.16 or earlier, then this extension is by default disabled. Otherwise, this extension is by default enabled.

## 1.8.4 Call Permissions

You can manage call permissions via the *Services* → *IPBX* → *Call management* → *Call permissions* page.

Call permissions can be used for:

- denying a user from calling a specific extension
- denying a user of a group from calling a specific extension
- denying a specific extension on a specific outgoing call from being called
- denying an incoming call coming from a specific extension from calling you

More than one extension can match a given call permission, either by specifying more than one extension for that permission or by using extension patterns.

You can also create permissions that allow a specific extension to be called instead of being denied. This make it possible to create a general “deny all” permission and then an “allow for some” one.

Finally, instead of unconditionally denying calling a specific extension, call permissions can instead challenge the user for a password to be able to call that extension.

As you can see, you can do a lot of things with XiVO's call permissions. They can be used to create fairly complex rules. That said, it is probably *not* a good idea to do so because it's pretty sure you'll get it somehow wrong.

### Examples

Note that when creating or editing a call permission, you must at least:

- fill the *Name* field
- have one extension / extension pattern in the *Extensions* field

#### Denying a user from calling a specific extension

- Add the extension in the extensions list
- In the *Users* tab, select the user

**Warning:** The extension can be anything but it will only work if it's the extension of a user or an extension that pass through an outgoing call. It does *not* work, for example, if the extension is the number of a conference room.

#### Denying a user of a group from calling a specific extension

First, you must create a group and add the user to this group. Note that groups aren't required to have a number.

Then,

- Add the extension in the extensions list
- In the *Groups* tab, select the group

#### Denying users from calling a specific extension on a specific outgoing call

- Add the extension in the extensions list
- In the *Outgoing calls* tab, select the outgoing call

Note that selecting both a user and an outgoing call for the same call permission doesn't mean the call permission applies only to that user. In fact, it means that the user can't call that extension and that the extension can't be called on the specific outgoing call. This is redundant and you will get the same result by not selecting the user.

#### Denying an incoming call coming from a specific extension from calling you

Call permissions on incoming calls are semantically different from the other scenarios since the extension that you add to the permission will match the extension of the caller (i.e. the caller number) and *not* the extension that the caller dialed (i.e. the callee number).

- Add the extension in the extensions list.
- In the *Incoming calls* tab, select the incoming call

## 1.8.5 Call Logs

Call logs are pre-generated from CEL entries. The generation is done automatically by `xivo-call-logd`. `xivo-call-logs` is also run nightly to generate call logs from CEL that were missed by `xivo-call-logd`.

---

**Note:** The oldest call logs are periodically removed. See [Purge Logs](#) for more details.

---

### Search Dashboard

Call logs can be accessed using the menu *Services* → *IPBX* → *Call management* → *Call Logs* page.

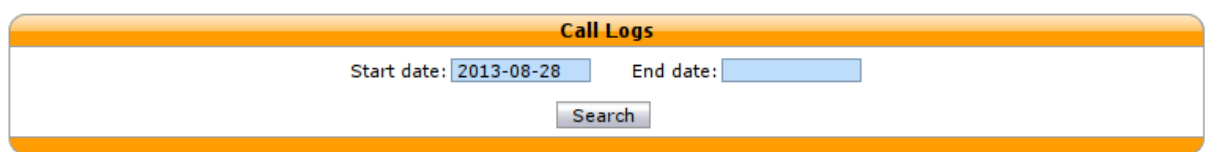

Fig. 1.36: Calls Records Dashboard

Call logs are presented in a CSV file. The CSV specifications are detailed in [the REST API documentation](#).

Specifying no start date returns all available call logs. Specifying a start date and no end date returns all call logs from start date until now.

### REST API

Call logs are also available from the REST API. See [Call Logs](#).

### Manual generation

Call logs can also be generated manually. To do so, log on to the target XiVO server and run:

```
xivo-call-logs
```

To avoid running for too long in one time, the call logs generation is limited to the N last unprocessed CEL entries (default 20,000). This means that successive calls to `xivo-call-logs` will process N more CELs, making about N/10 more calls available in call logs, going further back in history, while processing new calls as well.

You can specify the number of CEL entries to consider. For example, to generate calls using the 100,000 last unprocessed CEL entries:

```
xivo-call-logs -c 100000
```

## 1.8.6 CLI Tools

XiVO comes with a collection of console (CLI) tools to help administer the server.

### `xivo-dist`

`xivo-dist` is the xivo repository sources manager. It is used to switch between distributions (production, development, release candidate, archived version). Example use cases :

- switch to production repository : `xivo-dist xivo-five`
- switch to development repository : `xivo-dist xivo-dev`

- switch to release candidate repository : `xivo-dist xivo-rc`
- switch to an archived version's repository (here 14.18) : `xivo-dist xivo-14.18`

## 1.8.7 Conference Room

### Adding a conference room

In this example, we'll add a conference room with number 1010.

First, you need to define a conference room number range for the "default" context via the "Services / IPBX / IPBX configuration / Contexts" page.

Fig. 1.37: Adding a conference room number range to the default context

You can then create a conference room via the "Services / IPBX / IPBX settings / Conference rooms" page.

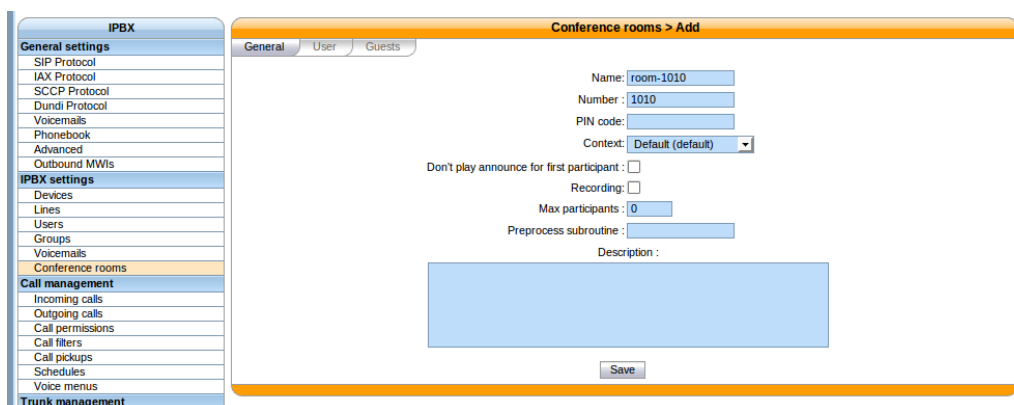

Fig. 1.38: Creating conference room 1010

In this example, we have only filled the "Name" and "Number" fields, the others have been left to their default value.

As you can see, there's quite a few options when adding / editing a conference room. Here's a description of the most common one:

**General / PIN code** Protects your conference room with a PIN number. People trying to join the room will be asked for the PIN code.

**General / Don't play announce for first participant** Don't play the "you are currently the only person in this conference" for the first participant.

**General / Max participants** Limits the number of participants in the conference room. A value of 0 means unlimited.

## 1.8.8 CTI Server

The CTI server configuration options can be found in the web-interface under the services tab.

## General Options

The general options allow the administrator to manage network connections between the CTI server and other services and clients.

The section named AMI connection allows the administrator to configure the information required to connect to the Asterisk Manager Interface (AMI). These fields should match the entries in `/etc/asterisk/manager.conf`.

**AMI Connection**

\* Login:

\* Password:

\* IP Address:

\* Port:

The section named Listening Ports allows the administrator to specify listening addresses and ports for the CTI server's interfaces.

- Fast AGI is the CTI server's entry point for the Asterisk dialplan. This address and port have nothing to do with the listening port and address of xivo-agid.
- CTI and CTIs are for the client's connection and secure connection respectively.
- Web Interface is for the port used to receive events from the XiVO web interface
- Info server a debugging console to do some introspection on the state of the CTI server
- Announce is used to notify the CTI server when a dialplan reload is requested

**Listening ports**

Activate	IP address	Port
<input checked="" type="checkbox"/>	* Fast AGI: <input type="text" value="127.0.0.1"/>	* <input type="text" value="5002"/>
<input checked="" type="checkbox"/>	* CTI: <input type="text" value="0.0.0.0"/>	* <input type="text" value="5003"/>
<input checked="" type="checkbox"/>	* CTIS: <input type="text" value="0.0.0.0"/> Certificate: <input type="text" value=""/> Private Key: <input type="text" value=""/>	* <input type="text" value="5013"/>
<input checked="" type="checkbox"/>	* Web Interface: <input type="text" value="127.0.0.1"/>	* <input type="text" value="5004"/>
<input checked="" type="checkbox"/>	* Info server: <input type="text" value="127.0.0.1"/>	* <input type="text" value="5005"/>
<input checked="" type="checkbox"/>	* Announce server: <input type="text" value="127.0.0.1"/>	* <input type="text" value="5006"/>

The timeout section allow the administrator to configure multiple timeouts.

- Socket timeout is the default timeout used for network connections.
- Login timeout is the timeout before a CTI connection is dropped if the authentication is not completed.

**Timeouts**

Socket timeout:

Login timeout:

Parting options are used to isolate XiVO users from each other. These options should be used when using the same XiVO for different enterprises.

Context separation is based on the user's line context. A user with no line is not the member of any context and will not be able to do anything with the CTI client.

**Note:** The CTI Server must be restarted to take into account this parameter.

Contexts Separation: ☒

## Presence Option

In the *Status* menu, under *Presences*, you can edit presences group. The default presence group is xivo. When editing a group, you will see a list of presences and there descriptions.

Presence Name	Description	Action
<input type="checkbox"/> > available	Disponible	
<input type="checkbox"/> > away	Sorti	
<input type="checkbox"/> > berightback	Bientôt de retour	
<input type="checkbox"/> > disconnected	Déconnecté	
<input type="checkbox"/> > donotdisturb	Ne pas déranger	
<input type="checkbox"/> > outtolunch	Parti Manger	

## Available configuration

- *Presence name* is the name of the presence
- *Display name* is the human readable representation of this presence
- *Color status* is the color associated to this presence
- *Other reachable statuses* is the list of presence that can be switched from this presence state
- *Actions* are post selection actions that are triggered by selecting this presence

Edit presence

Presence name : donotdisturb

Display name : Ne pas déranger  
The human readable name to be displayed

Color status : #FF032D  
Color of icon status

Other reachable statuses from this mode

## Actions

action	param
<i>Enable DND</i>	<code>{ 'true', 'false' }</code>
<i>Pause agent in all queues</i>	
<i>Unpause agent in all queues</i>	
<i>Agent logoff</i>	

## Enable encryption

To enable encryption of CTI communications between server and clients, you have to create a certificate in *Configuration* → *Certificates*.

Then, go in the menu *CTI Server* → *General settings* → *General*, and in the section *Listening ports*, check the line CTIS, and select both the certificate and the private key you created earlier. By default, the CTIS port is 5013.

In your XiVO Client, in the menu *XiVO Client* → *Configure* → *Connection*, click on the lock icon and adjust the port value if necessary.

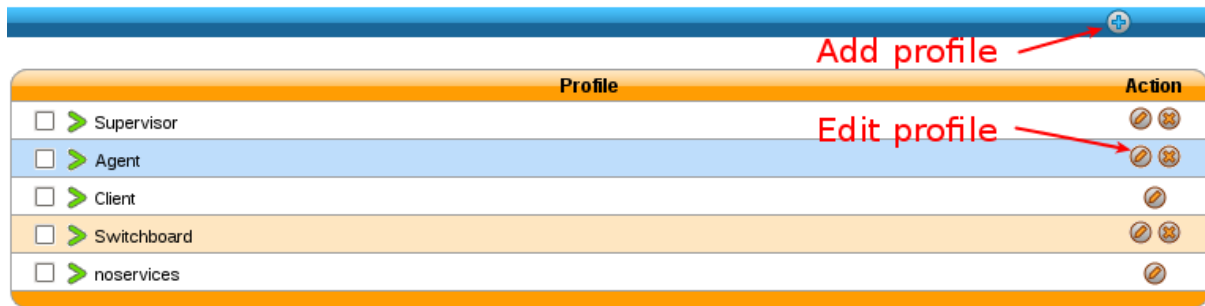

**Warning:** For now, there is no mechanism for strong authentication of the server. The connection is encrypted, but the identity of the server is not verified.

## CTI profiles

The CTI profiles define which features are made available to a user. You can configure which profile will be used by a user in the menu *IPBX* → *PBX Settings* → *Users*:

The screenshot shows the 'Users > Edit' interface for a user named 'Alice Wonderland'. The 'General' tab is selected. The 'XiVO Client' section is highlighted with a dashed blue border. Within this section, the 'Profile' dropdown menu is set to 'Switchboard' and is circled in red. Other visible settings include 'First name: Alice', 'Last name: Wonderland', 'Ringing time: 30 seconds', and 'Simultaneous calls: 5'.

You can also customize the default profiles or add new profiles in the menu *CTI Server* → *Profiles*:

## Xlets

To choose which features are available to users using a profile, you have to select which *Xlets* will be available.

The Xlets are detailed in *Xlets*.

The *Position* attribute determines how the Xlets will be laid out:

- *dock* will display a Xlet in its own frame. This frame can have some options:
  - *Floating* means that the frame can be detached from the main window of the CTI Client.
  - *Closable* means that the Xlet can be hidden
  - *Movable* means that the Xlet can be moved (either inside the main window or outside)
  - *Scroll* means that the Xlet will display a scroll bar if the Xlet is too large.
- *grid* will display a Xlet inside the main window, and it will not be movable. Multiple *grid* Xlets will be laid out vertically (the second below the first).
- *tab* will display a Xlet inside a tab of the Xlet *Tabber*. Thus the Xlet *Tabber* is required and can't be in a *tab* position.

The *Number* attribute gives the order of the Xlets, beginning with 0. The order applies only to Xlets having the same *Position* attribute.

## 1.8.9 Display customer informations

### Sheet Configuration

Sheets can be defined under *Services* → *CTI Server* → *Models* in the web interface. Once a sheet is defined, it has to be assigned to an event in the *Services* → *CTI Server* → *Events* menu.

**Model** The model contains the content of the displayed sheet.

**Event** Events are actions that trigger the defined sheet. A sheet can be assigned to many events. In that case, the sheet will be raised for each event.

CTI Server	Model	Description	Action
<b>General settings</b>			
General	<input type="checkbox"/> > custom1	sheet_action_custom1	
Profiles	<input type="checkbox"/> > dial	sheet_action_dial	
<b>Status</b>	<input type="checkbox"/> > Demo	Demo sheet	
Presences	<input type="checkbox"/> > queue	sheet_action_queue	
Phone hints	<input type="checkbox"/> > XIVO	Modèle de fiche de base.	
<b>Directories</b>			
Definitions			
Reverse directories			
Direct directories			
Display filters			
<b>Sheets</b>			
Models			
Events			
<b>Control</b>			
Restart CTI server			

## General settings

**Update model**

General settings Sheet Systray Actions

Name :

Focus: ☐

Description

You must give a name to your sheet to be able to select it later.

The `Focus` checkbox makes the XiVO Client pop up when the sheet is displayed, if the XiVO Client was hidden.

## Sheets

There are two different ways to configure the contents of the sheet:

- creating a custom sheet from the Qt designer. This gives you a total control on the layout of the information and allows you to save and process data entered during or after a call.
- listing the different fields and their content. The information will be automatically laid out in a linear fashion and will be read-only.

## Custom sheet

**Update model**

General settings Sheet Systray Actions

Disabled: ☐

Qt interface:

	Field title	Field type	Default value	Display value	
<input checked="" type="checkbox"/>	<input type="text"/>	<input type="text" value="form"/>	<input type="text"/>	<input type="text" value="qtui"/>	<input type="button" value="+"/>

**Configuring the sheet** The `Qt interface` field is the path to the UI file created by the Qt Designer. The path can either be a local file on your XiVO starting with `file://`, or a HTTP URL.

You must add a field with type `form` and display value `qtui` for the form to be displayed.

**Create a custom sheet with Qt Designer** The Qt Designer is part of the Qt development kit and is also available in the Qt Creator. They are available on the [Qt project website](#).

Here is an example of a small form created with Qt Designer.

The Qt Designer screenshot.

**Warning:** In Qt Designer, one must set 'vertical layout' on the top widget (right click on the top widget > Lay out > Vertical layout).

You can download the file generated by this example from Qt Designer: `example-form.ui`

Contacts Fiches Fax Historique Répertoire Services Répertoire personnel Conférences

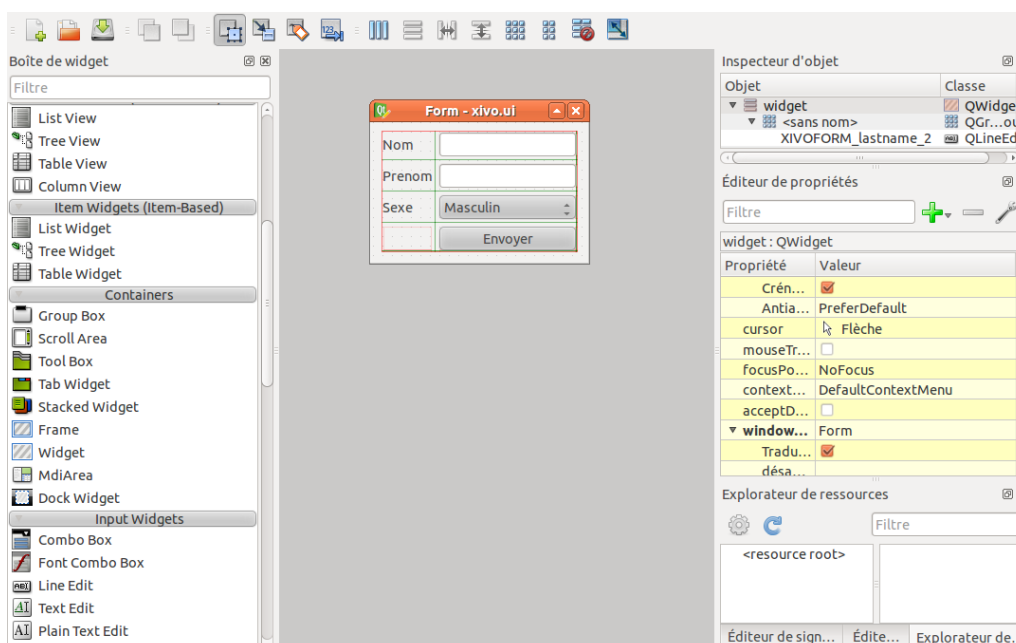

20:39:47

Nom

Prenom

Sexe Masculin

Envoyer

Text fields (QLineEdit, QLabel, QPlainTextEdit) can contain variables that will be substituted. See the [variable list](#) for more information.

**List of fields** Default XiVO sheet example :

	Field title	Field type	Default value	Display value	
<input checked="" type="checkbox"/>	Nom	title		{xivo-calleridname}	
<input checked="" type="checkbox"/>	Numéro	text		{xivo-calleridnum}	
<input checked="" type="checkbox"/>	Origine	text		{xivo-origin}	

Example showing all kinds of fields:

	Field title	Field type	Default value	Display value	
<input checked="" type="checkbox"/>	Phone	phone	Unknown	{xivo-calleridnum}	
<input checked="" type="checkbox"/>	Titre	title	test	test titre	
<input checked="" type="checkbox"/>	picture	picture	picture	{xivo-callerpicture}	
<input checked="" type="checkbox"/>	Test	text	text	{dp-test}	
<input checked="" type="checkbox"/>		form		qtui	
<input checked="" type="checkbox"/>	Uniq	text		{xivo-uniqueid}	
<input checked="" type="checkbox"/>	url	url		http://git.xivo.fr	
<input checked="" type="checkbox"/>	urlx	urlx		http://duckduckgo.c	

Each field is represented by the following parameters :

- Field title : name of your line used as label on the sheet.
- Field type : define the type of field displayed on the sheet. Supported field types :
  - title : to create a title on your sheet
  - text : show a text
  - url : a simple url link, open your default browser.
  - urlx : an url button
  - phone : create a tel: link, you can click to call on your sheet.
  - form : show the form from an ui predefined. It's an xml ui. You need to define qtui in display format.
- Default value : if given, this value will be used when all substitutions in the display value field fail.
- Display value : you can define text, variables or both. See the [variable list](#) for more information.

**Variables** Three kinds of variables are available :

- *xivo-* prefix is reserved and set inside the CTI server:
  - *xivo-where* for sheet events, event triggering the sheet
  - *xivo-origin* place from where the lookup is requested (did, internal, forcelookup)
  - *xivo-direction* incoming or internal
  - *xivo-did* DID number
  - *xivo-calleridnum*
  - *xivo-calleridname*
  - *xivo-calleridrdnis* contains information whether there was a transfer
  - *xivo-calleridton* Type Of Network (national, international)
  - *xivo-calledidnum*
  - *xivo-calledidname*
  - *xivo-ipbxid* (*xivo-astid* in 1.1)
  - *xivo-directory* : for directory requests, it is the directory database the item has been found
  - *xivo-queue*name queue called
  - *xivo-agent*number agent number called
  - *xivo-date* formatted date string
  - *xivo-time* formatted time string, when the sheet was triggered
  - *xivo-channel* asterisk channel value (for advanced users)
  - *xivo-uniqueid* asterisk uniqueid value (for advanced users)
- *db-* prefixed variables are defined when the reverse lookup returns a result.

For example if you want to access to the reverse lookup full name, you need to define a field `fullname` in the directory definition, mapping to the full name field in your directory. The `{db-fullname}` will be replaced by the caller full name. Every field of the directory is accessible this way.

- *dp-* prefixed ones are the variables set through the dialplan (through UserEvent application)

For example if you want to access from the dialplan to a variable `dp-test` you need to add in your dialplan this line (in a subroutine):

```
UserEvent(dialplan2cti,UNIQUEID: ${UNIQUEID},CHANNEL: ${CHANNEL},VARIABLE: test,VALUE: "Salut
```

The `{dp-test}` displays Salut.

**Sending informations during/after a call** After showing a sheet, the XiVO Client can also send back information to XiVO for post-processing or archiving.

Here are the requirements:

- The sheet must contain a button named `save` to submit information
- Supported widgets:
  - `QCalendarWidget`
  - `QCheckBox`
  - `QComboBox`
  - `QDateEdit`

- QDateTime
- QDateTimeEdit
- QDoubleSpinBox
- QLabel
- QLineEdit
- QList
- QPlainTextEdit
- QRadioButton
- QSpinBox
- QTimeEdit

- Fields must have their name starting with `XIVOFORM_`

If you want to send information that is not visible, you can make the widget invisible on the sheet:

- change the `maximumWidth` or `maximumHeight` property to 0
- edit the `.ui` file and add the following property to the widget:

```
<property name="visible">
  <bool>false</bool>
</property>
```

When a CTI client submits a custom sheet, a `call_form_result` event is published on the event bus.

## Systray

Mostly the same syntax as the sheet with less field types available (title, body). A Systray popup will display a single title (the last one added to the list of fields) and zero, one or more fields of type 'body'.

Field title	Field type	Default value	Display value
Nom	title		{xivo-calledidname}
Numéro	body		{xivo-calleridnum}
Origine	body		{xivo-origin}

Save

**Warning:** The popup message on MacOSX works with Growl <http://growl.info>. We could get simple sheet popup to work using the free Growl Fork <http://www.macupdate.com/app/mac/41038/growl-fork> Note that this is not officially supported.

## Actions

The action is for the xivo client, so if you configure an action, please be sure you understand it's executed by *the client*. You need to allow this action in the client configuration too (menu *XiVO Client* -> *Configure*, tab *Functions*, tick option *Customer Info* and in sub-tab *Customer Info* tick the option *Allow the Automatic Opening of URL*).

The field in this tab receives the URL that will be displayed in your browser. You can also use variable substitution in this field.

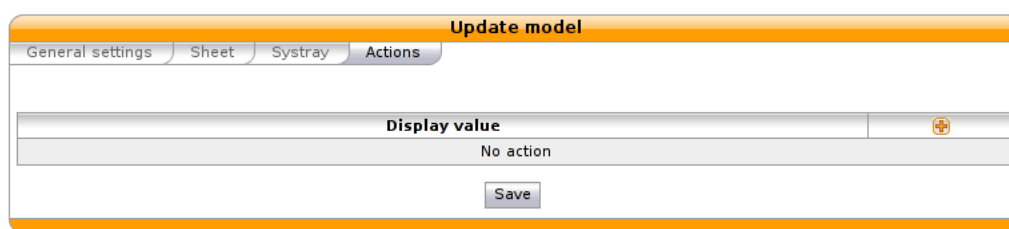

- `http://example.org/foo` opens the URL on the default browser
- `http://example.org/{xivo-did}` opens the URL on the default browser, after substituting the `{xivo-did}` variable. If the substitution fails, the URL will remain `http://example.org/{xivo-did}`, i.e. the curly brackets will still be present.
- `http://example.org/{xivo-did}?origin={xivo-origin}` opens the URL on the default browser, after substituting the variables. If at least one of the substitution is successful, the failing substitutions will be replaced by an empty string. For example, if `{xivo-origin}` is replaced by 'outcall' but `{xivo-did}` is not substituted, the resulting URL will be `http://example.org/?origin=outcall`
- `tcp://x.y.z.co.fr:4545/?var1=a1&var2=a2` connects to TCP port 4545 on x.y.z.co.fr, sends the string `var1=a1&var2=a2`, then closes
- `udp://x.y.z.co.fr:4545/?var1=a1&var2=a2` connects to UDP port 4545 on x.y.z.co.fr, sends the string `var1=a1&var2=a2`, then closes

---

**Note:** any string that would not be understood as an URL will be handled like and URL it is a process to launch and will be executed as it is written

---

For `tcp://` and `udp://`, it is a requirement that the string between `/` and `?` is empty. An extension could be to define other serialization methods, if needed.

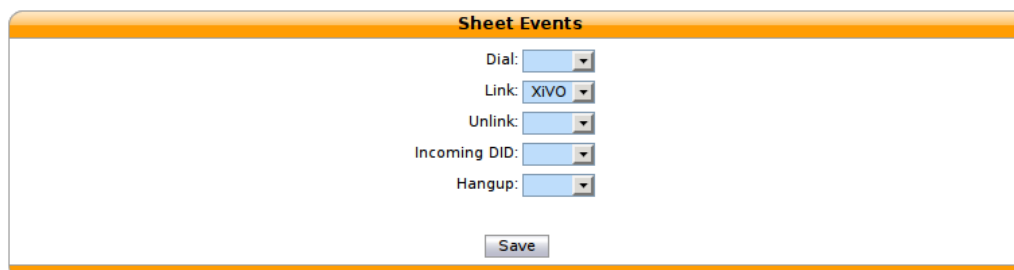

## Event configuration

You can configure a sheet when a specific event is called. For example if you want to receive a sheet when an agent answers to a call, you can choose a sheet model for the Link event.

The following events are available :

- Dial: When the member's phone starts ringing for calls on a group or queue or when the user receives a call
- Link: When a user or agent answers a call
- Unlink: When a user or agent hangup a call received from a queue
- Incoming DID: Received a call in a DID
- Hangup: Hangup the call

The informations about a call are displayed via the XiVO Client on forms called sheets.

### Example: Display a Web page when an agent answers a call

The first step is to assign the URL to a dialplan variable. Go in the *Services* → *IPBX* → *Configuration files* and create a new file called `setsheeturl.conf`. In this file, put the following:

```
[setsheeturl]
exten = s,1,NoOp(Starting Set Sheet URL)
same = n,Set(SHEET_URL_CTI=http://documentation.xivo.io)
same = n,UserEvent(dialplan2cti,UNIQUEID: ${UNIQUEID},CHANNEL: ${CHANNEL},VARIABLE: mysheeturl,V
```

You can replace `documentation.xivo.io` by the URL you want.

The second step is to set the URL when the call is queued. To do that, we will use a preprocessing subroutine. This is configured in the queue configuration : go to *Services* → *Call center* → *Queues* and edit the queue. Set the field *Preprocessing subroutine* to `setsheeturl` (the same as above).

The third step is to configure the sheet to open the wanted URL. Go to *Services* → *CTI Server* → *Sheets* → *Models* and create a new sheet. Keep the default for everything except the Action tab, add a field and set it to `{dp-mysheeturl}` (the same as above).

The fourth and final step is to trigger the sheet when the agent answers the queued call. Go to *Services* → *CTI Server* → *Sheets* → *Events* and link the event *Agent linked* to the sheet you just created.

That's it, you can assign agents to your queue, log the agents and make them answer calls with the XiVO Client opened, and your browser should open the specified URL.

## 1.8.10 Devices

### Synchronize a device

First you have to display the list of devices.

Fig. 1.39: Click on the synchronize button for a device.

	MAC	IP	Vendor	Model	Plugin	Action
<input type="checkbox"/>	00:14:7f:e1:37:62	10.97.5.100	Technicolor	ST2030	xivo-technicolor-ST2030-2.74	
<input type="checkbox"/>	00:08:5d:13:ca:05	10.97.5.102	Aastra	6739i	xivo-aastra-3.2.2.56	
<input type="checkbox"/>	00:0e:08:dd:64:2e	10.97.5.103	Cisco	SPA962	xivo-cisco-spa-legacy	
<input type="checkbox"/>	00:14:7f:e1:42:b3	10.97.5.104	Technicolor	ST2030	xivo-technicolor-ST2030-2.74	

Fig. 1.40: List devices

**You will see a pop-up to confirm synchronization** Click on the <ok> button.

You must wait until the full synchronization process has completed to determine the state returned back from the device. This can take several seconds. It is important to wait and do nothing during this time.

If synchronization is successful, a green information balloon notifies you of success.

If synchronization fails, a red information balloon warns you of failure.

### Synchronize multiple devices

**Warning:** When using multiple synchronization, the individual return states will not be displayed.

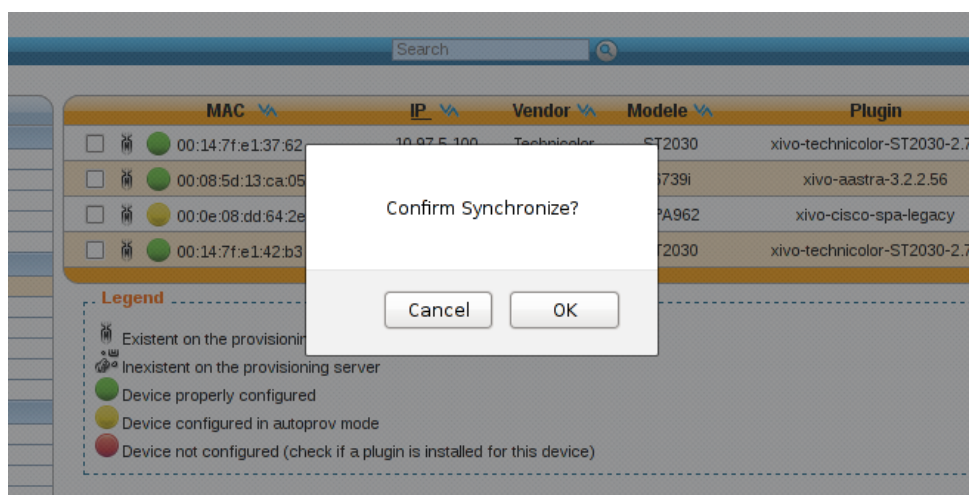

Fig. 1.41: Alert confirm synchronize

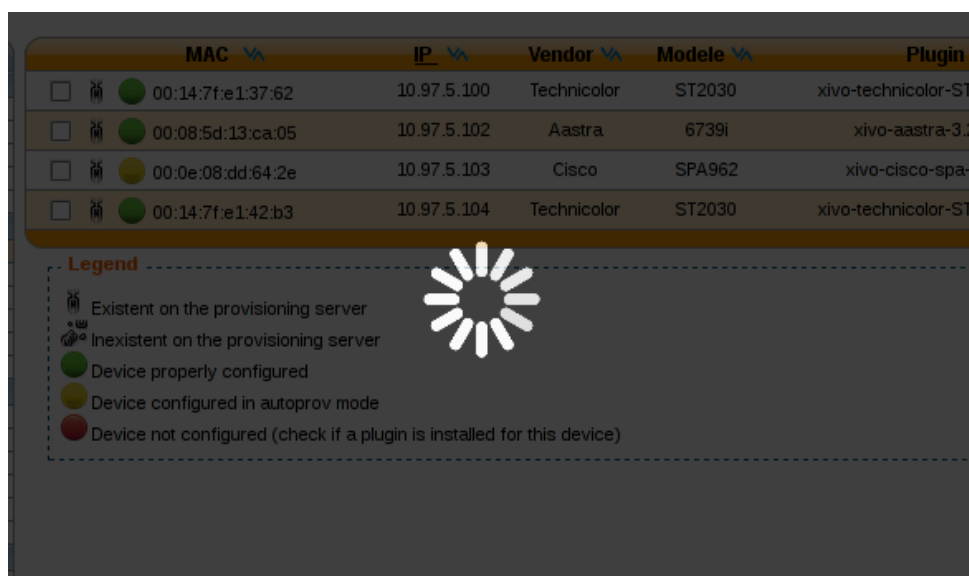

Fig. 1.42: Request synchronization processing

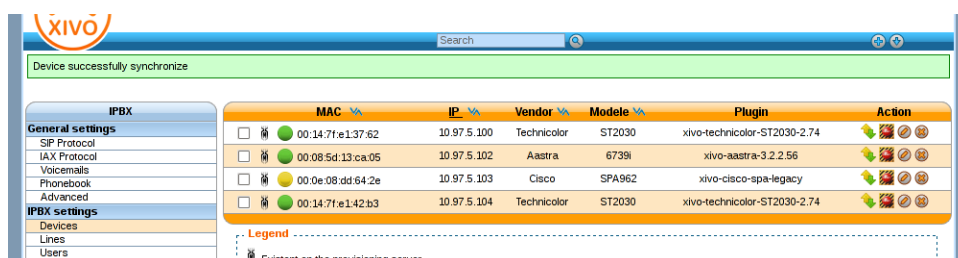

Fig. 1.43: Device successfully synchronized

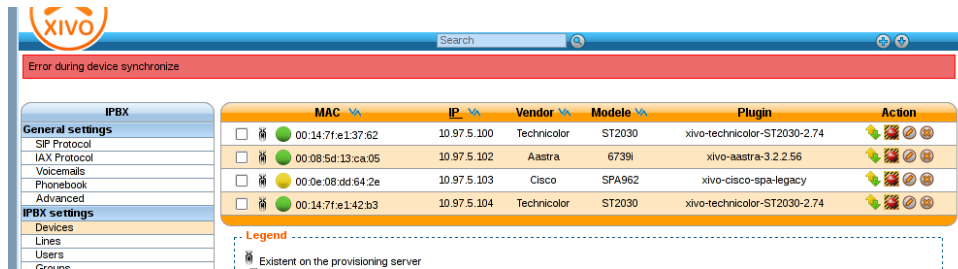

Fig. 1.44: Error during device synchronization

Fig. 1.45: Synchronize selected devices

Select the devices you want to synchronize by checking the boxes.

A pop-up will appear requesting confirmation.

Fig. 1.46: Synchronize selected devices confirmation

If mass synchronization was successfully sent to the devices, a green information balloon notifies you of success.

## 1.8.11 Directories

This page documents how to add and configure directories from custom sources. Directories added from custom sources can be used for lookup via the *CTI Client* or for *reverse lookup* on incoming calls. The directory feature of phones do not use these data sources.

**Note:** This page describes how to add custom sources of contacts. For other sources of contacts, see *Phonebook*, and *LDAP*.

### Add a data source

You can add new data sources via the *Configuration* → *Management* → *Directories* page.

### File directories

The source file of the directory must be in CSV format. You will be able to choose the headers and the separator in the next steps. For example, the file will look like:

Fig. 1.47: Mass synchronization request sent successfully

```
title|firstname|lastname|displayname|society|mobilenumber|email
mr|Emmett|Brown|Brown Emmett|DMC|5555551234|emmet.brown@dmc.example.com
```

Example:

- *Directory name*: csv-phonebook
- *Type*: File
- *URI*: /data/csv-phonebook.csv

### Web service directories

The data returned by the Web service must have the same format than the file directory. In the same way, you will be able to choose the headers and the separator in the next step.

Example:

- *Directory name*: ws-phonebook
- *Type*: Webservices
- *URI*: http://example.org:8000/ws-phonebook

### Configure the access to the data source

Go in *Services* → *CTI Server* → *Directories* → *Definitions* and add a new directory definition.

- *URI*: your data source
- *Delimiter*: the field delimiter in your data source
- *Direct match*: the key used to match entries for direct lookup
- *Match reverse directories*: idem, but for reverse lookup
- *Mapped field*:
  - the *fieldname* is the identifier of the field. It will be used in the display filter, so look there if you want to use an existing one, or make it up if you want a custom display filter.
  - the *value* is the corresponding header of your data source.

### File directories

For file directories, the *Direct match* and the *Match reverse directories* must be filled with the name of the column used to match entries.

For example, given you have the following CSV:

```
name|phone
John|5551234
```

And you want to do direct lookup on the `name` column and reverse lookup on the `phone` column, then you'll use:

- *Direct match*: name
- *Match reverse directories*: phone

### Web service directories

For web service directories, the *Direct match* and the *Match reverse directories* must be filled with the name of the HTTP query parameter that will be used when doing the HTTP requests.

For example, given you have the following directory definition:

- *Direct match*: search
- *Match reverse directories*: phonesearch

When a direct lookup for "John" is performed, then the following HTTP request:

```
GET /ws-phonebook?search=John HTTP/1.1
```

is emitted. When a reverse lookup for "5551234" is performed, then the following HTTP request:

```
GET /ws-phonebook?phonesearch=5551234 HTTP/1.1
```

is emitted.

Note that the CSV returned by the Web service is not further processed.

### Reverse lookup

To enable reverse lookup, you need to add an entry in *Mapped fields*:

- *Fieldname*: reverse
- *Value*: the header of your data source that you want to see as the caller ID on your phone on incoming calls

### Configure the display of the data

Edit the default display filter or create your own in *Services* → *CTI Server* → *Directories* → *Display filters*.

Each line in the display filter will result in a header in your XiVO Client.

- *Field title* will be the text displayed in the header
- *Display format* is a format string, for example `{db-firstname} {db-lastname}`, where `{db-***}` will be replaced with the value from the data source. `***` is the identifier of the field configured in the directory definition, ``not`` the header of your data source.

### Make your directory available

Go in *Services* → *CTI Server* → *Directories* → *Reverse/Direct directories*, select your display filter if needed and add the directory you just created.

You may have to restart the CTI Server or the AGI daemon to apply the change:

```
service xivo-ctid restart
service xivo-agid restart
```

### 1.8.12 Directed Pickup

Directed pickup allows a user to intercept calls made to another user.

For example, if a user with number 1001 is ringing, you can dial \*81001 from your phone and it will intercept (i.e. pickup) the call to this user.

The extension prefix used to pickup calls can be changed via the *Services* → *IPBX* → *IPBX services* → *Extensions* page.

#### Custom Line Limitation

There is a case where directed pickup does not work, which is the following:

Given you have a user U with a line of type "customized"  
Given this custom line is using DAHDI technology  
Given this user is a member of group G  
When a call is made to group G  
Then you won't be able to intercept the call made to U by pressing \*8<line number of U>

If you find yourself in this situation, you'll need to write a bit of dialplan.

For example, if you have the following:

- a user with a custom line with number 1001 in context default
- a custom line with interface DAHDI/g1/5551234

Then add the following, or similar:

```
[custom_lines]
exten = line1001,1,NoOp()
same  = n,Set(____PICKUPMARK=1001%default)
same  = n,Dial(DAHDI/g1/5551234)
same  = n,Hangup()
```

And do a `dialplan reload` in the asterisk CLI.

Then, edit the line of the user and change the interface value to `Local/line1001@custom_lines`

Note that you'll need to update your dialplan if you update the number of the line or the context.

### 1.8.13 Entities

#### Purpose

In some cases, as the telephony provider, you want different independent organisations to have their telephony served by your XiVO, e.g. different departments using the same telephony infrastructure, but you do not want each organisation to see or edit the configuration of other organisations.

#### Configuration

In *Configuration* → *Entities*, you can create entities, one for each independant organisation.

In *Configuration* → *Users*, you can select an entity for each administrator.

---

**Note:** Once an entity is linked with an administrator, it can not be deleted. You have to unlink the entity from all administrator to be able to delete it.

---

For the new entity to be useful, you need to create contexts in this entity. You may need:

- an Internal context for users, groups, queues, etc.

- an Incall context for incoming calls
- an Outcall context for outgoing calls, which should be included in the Internal context for the users to be able to call external numbers

## Limitations

### Global Fields

Some fields are globally unique and will collide when the same value is used in different entities:

- User CTI login
- Agent number
- Queue name
- Context name

An error message will appear when creating resources with colliding parameters, saying the resource already exists, even if the entity-linked administrator can not see them.

### Affected Lists

Only the following lists may be filtered by entity:

- Lines
- Users
- Devices
- Groups
- Voicemails
- Conference Rooms
- Incoming calls
- Call filters
- Call pickups
- Schedules
- Agents
- Queues

For the devices:

- The filtering only applies to the devices associated with a line.
- The devices in autoprov mode or not configured mode are visible by every administrator.

### REST API

The REST API does not have the notion of entity. When creating a resource without context via REST API, the resource will be associated to an arbitrary entity. Affected resources are:

- Contexts
- Call filters
- Group pickups
- Schedules

- Users

## 1.8.14 Fax

### Fax transmission

It's possible to send faxes from XiVO using the fax Xlet in the XiVO client.

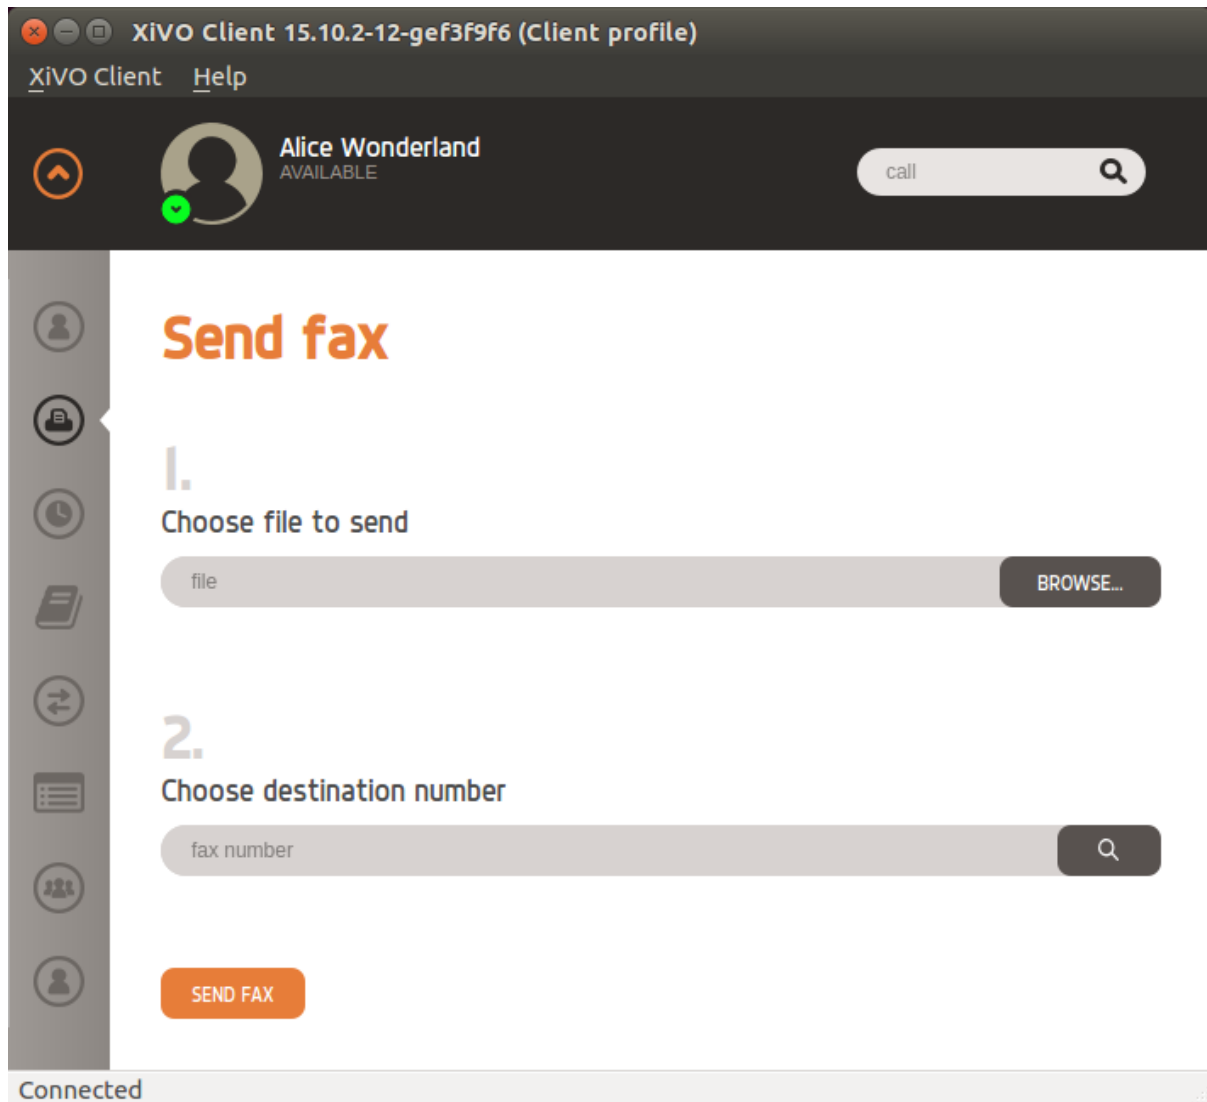

Fig. 1.48: The fax Xlet in the XiVO Client

The file to send must be in PDF format.

**Warning:** Sending faxes is currently not supported if there is a network equipment that changes TCP port numbers or IP addresses, like a router doing NAT or NAPT, between the CTI client and the CTI server.

## Fax reception

### Adding a fax reception DID

If you want to receive faxes from XiVO, you need to add incoming calls definition with the *Application* destination and the *FaxToMail* application for every DID you want to receive faxes from.

This applies even if you want the action to be different from sending an email, like putting it on a FTP server. You'll still need to enter an email address in these cases even though it won't be used.

Note that, as usual when adding incoming call definitions, you must first define the incoming call range in the used context.

### Changing the email body

You can change the body of the email sent upon fax reception by editing `/etc/xivo/mail.txt`.

The following variable can be included in the mail body:

- `%(dstnum)s`: the DID that received the fax

If you want to include a regular percent character, i.e. `%`, you must write it as `%%` in `mail.txt` or an error will occur when trying to do the variables substitution.

The `agid` service must be restarted to apply changes:

```
/etc/init.d/xivo-agid restart
```

### Changing the email subject

You can change the subject of the email sent upon fax reception by editing `/etc/xivo/asterisk/xivo_fax.conf`.

Look for the `[mail]` section, and in this section, modify the value of the `subject` option.

The available variable substitution are the same as for the email body.

The `agid` service must be restarted to apply changes:

```
/etc/init.d/xivo-agid restart
```

### Changing the email from

You can change the from of the email sent upon fax reception by editing `/etc/xivo/asterisk/xivo_fax.conf`.

Look for the `[mail]` section, and in this section, modify the value of the `email_from` option.

The agid service must be restarted to apply changes:

```
/etc/init.d/xivo-agid restart
```

### Using the advanced features

The following features are only available via the `/etc/xivo/asterisk/xivo_fax.conf` configuration file. They are not available from the web-interface.

The configuration file has documentation embedded in it in the form of comments, so we recommend you reading them before editing the configuration file.

The way it works is the following:

- you first declare some backends, i.e. actions to be taken when a fax is received. A backend name looks like `mail`, `ftp_example_org` or `printer_office`.
- once your backends are defined, you can use them in your destination numbers. For example, when someone calls the DID 100, you might want the `ftp_example_org` and `mail` backend to be run, but otherwise, you only want the `mail` backend to be run.

Here's an example of a valid `/etc/xivo/asterisk/xivo_fax.conf` configuration file:

```
[general]
tiff2pdf = /usr/bin/tiff2pdf
mutt = /usr/bin/mutt
lp = /usr/bin/lp

[mail]
subject = FAX reception to %(dstnum)s
content_file = /etc/xivo/mail.txt
email_from = no-reply+fax@xivo.io

[ftp_example_org]
host = example.org
username = foo
password = bar
directory = /foobar

[dstnum_default]
dest = mail

[dstnum_100]
dest = mail, ftp_example_org
```

The section named `dstnum_default` will be used only if no DID-specific actions are defined.

After editing `/etc/xivo/asterisk/xivo_fax.conf`, you need to restart the agid server for the changes to be applied:

```
$ /etc/init.d/xivo-agid restart
```

**Using the FTP backend** The FTP backend is used to send a PDF version of the received fax to an FTP server.

An FTP backend is always defined in a section beginning with the `ftp` prefix. Here's an example for a backend named `ftp_example_org`:

```
[ftp_example_org]
host = example.org
username = foo
password = bar
directory = /foobar
```

The `directory` option is optional and if not specified, the document will be put in the user's root directory.

The uploaded file are named like `${XIVO_SRCNUM}-${EPOCH}.pdf`.

**Using the printer backend** To use the printer backend, you must have the `cups-client` package installed on your XiVO:

```
$ apt-get install cups-client
```

The printer backend uses the `lp` command to print faxes.

A printer backend is always defined in a section beginning with the `printer` prefix. Here's an example for a backend named `printer_office`:

```
[printer_office]
name = office
convert_to_pdf = 1
```

When a fax will be received, the system command `lp -d office <faxfile>` will be executed.

The `convert_to_pdf` option is optional and defaults to 1. If it is set to 0, the TIFF file will not be converted to PDF before being printed.

**Warning:** You need a CUPS server set up somewhere on your network.

**Using the mail backend** By default, a mail backend named `mail` is defined. You can define more mail backends if you want. Just look what the default mail backend looks like.

**Using the log backend** There's also a log backend available, which can be used to write a line to a file every time a fax is received.

## Fax detection

XiVO **does not currently support Fax Detection**. A workaround is described in the [Fax detection](#) section.

## Using analog gateways

XiVO is able to provision Cisco SPA122 and Linksys SPA2102, SPA3102 and SPA8000 analog gateways which can be used to connect fax equipments. This section describes the creation of custom template *for SPA3102* which modifies several parameters.

---

**Note:** With SPA ATA plugins **>= v0.8**, you **should not need** to follow this section anymore since all of these parameters are now set in the base templates of all, except for `Echo_Canc_Adapt_Enable`, `Echo_Supp_Enable`, `Echo_Canc_Enable`.

---

---

**Note:** Be aware that most of the parameters are or could be country specific, i.e. :

- Preferred Codec,
- FAX Passthru Codec,

- RTP Packet Size,
  - RTP-Start-Loopback Codec,
  - Ring Waveform,
  - Ring Frequency,
  - Ring Voltage,
  - FXS Port Impedance
- 

1. Create a custom template for the SPA3102 base template:

```
cd /var/lib/xivo-provd/plugins/xivo-cisco-spa3102-5.1.10/var/templates/  
cp ../../templates/base.tpl .
```

2. Add the following content before the `</flat-profile>` tag:

```
<!-- CUSTOM TPL - for faxes - START -->  
  
{% for line_no, line in sip_lines.iteritems() %}  
<!-- Dial Plan: L{{ line_no }} -->  
<Dial_Plan_{{ line_no }}_ ua="na">([x*#].)</Dial_Plan_{{ line_no }}_>  
  
<Call_Waiting_Serv_{{ line_no }}_ ua="na">No</Call_Waiting_Serv_{{ line_no }}_>  
<Three_Way_Call_Serv_{{ line_no }}_ ua="na">No</Three_Way_Call_Serv_{{ line_no }}_>  
  
<Preferred_Codec_{{ line_no }}_ ua="na">G711a</Preferred_Codec_{{ line_no }}_>  
<Silence_Supp_Enable_{{ line_no }}_ ua="na">No</Silence_Supp_Enable_{{ line_no }}_>  
<Echo_Canc_Adapt_Enable_{{ line_no }}_ ua="na">No</Echo_Canc_Adapt_Enable_{{ line_no }}_>  
<Echo_Supp_Enable_{{ line_no }}_ ua="na">No</Echo_Supp_Enable_{{ line_no }}_>  
<Echo_Canc_Enable_{{ line_no }}_ ua="na">No</Echo_Canc_Enable_{{ line_no }}_>  
<Use_Pref_Codec_Only_{{ line_no }}_ ua="na">yes</Use_Pref_Codec_Only_{{ line_no }}_>  
<DTMF_Tx_Mode_{{ line_no }}_ ua="na">Normal</DTMF_Tx_Mode_{{ line_no }}_>  
  
<FAX_Enable_T38_{{ line_no }}_ ua="na">Yes</FAX_Enable_T38_{{ line_no }}_>  
<FAX_T38_Redundancy_{{ line_no }}_ ua="na">1</FAX_T38_Redundancy_{{ line_no }}_>  
<FAX_Passthru_Method_{{ line_no }}_ ua="na">ReINVITE</FAX_Passthru_Method_{{ line_no }}_>  
<FAX_Passthru_Codec_{{ line_no }}_ ua="na">G711a</FAX_Passthru_Codec_{{ line_no }}_>  
<FAX_Disable_ECAN_{{ line_no }}_ ua="na">yes</FAX_Disable_ECAN_{{ line_no }}_>  
<FAX_Tone_Detect_Mode_{{ line_no }}_ ua="na">caller or callee</FAX_Tone_Detect_Mode_{{ line_no }}_>  
  
<Network_Jitter_Level_{{ line_no }}_ ua="na">very high</Network_Jitter_Level_{{ line_no }}_>  
<Jitter_Buffer_Adjustment_{{ line_no }}_ ua="na">disable</Jitter_Buffer_Adjustment_{{ line_no }}_>  
{% endfor %}  
  
<!-- SIP Parameters -->  
<RTP_Packet_Size ua="na">0.020</RTP_Packet_Size>  
<RTP-Start-Loopback_Codec ua="na">G711a</RTP-Start-Loopback_Codec>  
  
<!-- Regional parameters -->  
<Ring_Waveform ua="rw">Sinusoid</Ring_Waveform> <!-- options: Sinusoid/Trapezoid -->  
<Ring_Frequency ua="rw">50</Ring_Frequency>  
<Ring_Voltage ua="rw">85</Ring_Voltage>  
  
<FXS_Port_Impedance ua="na">600+2.16uF</FXS_Port_Impedance>  
<Caller_ID_Method ua="na">Bellcore (N.Amer,China)</Caller_ID_Method>  
<Caller_ID_FSK_Standard ua="na">bell 202</Caller_ID_FSK_Standard>  
  
<!-- CUSTOM TPL - for faxes - END -->
```

3. Reconfigure the devices with:

```
xivo-provd-cli -c 'devices.using_plugin("xivo-cisco-spa3102-5.1.10").reconfigure()' '
```

4. Then reboot the devices:

```
xivo-provd-cli -c 'devices.using_plugin("xivo-cisco-spa3102-5.1.10").synchronize()' '
```

Most of this template can be copy/pasted for a SPA2102 or SPA8000.

## Using a SIP Trunk

Fax transmission, to be successful, *MUST* use G.711 codec. Fax streams cannot be encoded with lossy compression codecs (like G.729a).

That said, you may want to establish a SIP trunk using G.729a for all other communications to save bandwidth. Here's a way to be able to receive a fax in this configuration.

**Note:** There are some prerequisites:

- your SIP Trunk must offer both G.729a and G.711 codecs
- your fax users must have a customized outgoing calleridnum (for the codec change is based on this variable)

1. We assume that outgoing call rules and fax users with their DID are created
2. Create the file `/etc/asterisk/extensions_extra.d/fax.conf` with the following content:

```
;; For faxes :
; The following subroutine forces inbound and outbound codec to alaw.
; For outbound codec selection we must set the variable with inheritance.
; Must be set on each Fax DID
[pre-incall-fax]
exten = s,1,NoOp(### Force alaw codec on both inbound (operator side) and outbound (analog gateway)
exten = s,n,Set(SIP_CODEC_INBOUND=alaw)
exten = s,n,Set(__SIP_CODEC_OUTBOUND=alaw)
exten = s,n,Return()

; The following subroutine forces outbound codec to alaw based on outgoing callerid number
; For outbound codec selection we must set the variable with inheritance.
; Must be set on each outgoing call rule
[pre-outcall-fax]
exten = s,1,NoOp(### Force alaw codec if caller is a Fax ###)
exten = s,n,GotoIf("${CALLERID(num)}" = "0112697845"?alaw:)
exten = s,n,GotoIf("${CALLERID(num)}" = "0112697846"?alaw:end)
exten = s,n(alaw),Set(__SIP_CODEC_OUTBOUND=alaw)
exten = s,n(end),Return()
```

3. For each Fax users' DID add the following string in the `Preprocess` subroutine field:

```
pre-incall-fax
```

4. For each Outgoing call rule add the the following string in the `Preprocess` subroutine field:

```
pre-outcall-fax
```

## 1.8.15 Graphics

The Services/Graphics section gives a historical overview of a XiVO system's activity based on snapshots recorded every 5 minutes. Graphics are available for the following resources :

- CPU
- Entropy

- Interruptions
- IRQ Stats
- System Load
- Memory Usage
- Open Files
- Open Inodes
- Swap Usage

Each section is presented as a series of 4 graphics : daily, weekly, monthly and yearly history. Each graphic can be clicked on to zoom. All information presented is read only.

### System load

### Memory usage

## 1.8.16 Groups

Groups are used to be able to call a set of users.

Group name cannot be `general` reserved in asterisk configuration.

### 1.8.17 Group Pickup

Pickup groups allow users to intercept calls directed towards other users of the group. This is done either by dialing a special extension or by pressing a function key.

The group pickup is limited to 64 groups.

#### Quick Summary

In order to be able to use group pickup you have to:

- Create a pickup group
- Enable an extension to intercept calls
- Add a function key to interceptors

#### Creating a Pickup Group

Pickup groups can be create in the *Services* → *Call management* → *Call pickups* page.

In the *general* tab, you can define a name and a description for the pickup group. In the *Interceptors* tab, you can define a list of users, groups or queues that can intercept calls. In the *Intercepted* tab, you can define a list of users, groups or queues that can be intercepted.

**Pickup groups > Edit test**

General Interceptors Intercepted

**Groups**

0 items selected	Remove all	Add all
		huge (3000@pcm-dev) +

**Queues**

Create queue

**Users**

3 items selected	Remove all	Add all
⬇ Père Noël	—	User 0500 +
⬇ Linda	—	User 0501 +
⬇ Fernando L'Iguane	—	User 0502 +
		User 0503 +
		User 0504 +
		User 0505 +
		User 0506 +

Save

## Enabling an Interception Extension

The pickup extension can be defined in the *Services* → *Extensions* page.

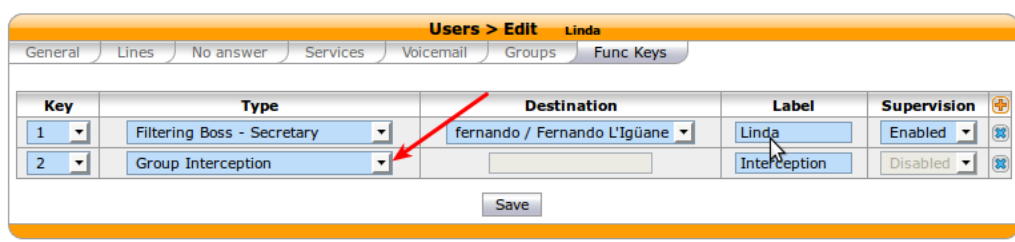

The extension used by group pickup is called *Group interception* it's default value is \*8.

**Warning:** The extension must be enabled even if a function key is used.

## Adding a Function Key to an Interceptor

To assign a function to an interceptor, go to *Services* → *Users*, edit an interceptor and go to the *Func Keys* tab.

Add a new function key of type *Group Interception* and save.

Key	Type	Destination	Label	Supervision
1	Filtering Boss - Secretary	fernando / Fernando L'Iguane	Linda	Enabled
2	Group Interception		Interception	Disabled

Save

## 1.8.18 Server/Hardware

This section describes how to configure the telephony hardware on a XiVO server.

---

**Note:** Currently XiVO supports only Digium Telephony Interface cards

---

The configuration process is the following :

### Load the correct DAHDI modules

For your Digium card to work properly you must load the appropriate DAHDI kernel module. This is done via the file `/etc/dahdi/modules` and this page will guide you through its configuration.

### Know which card is in your server

You can see which cards are detected by issuing the `dahdi_hardware` command:

```
dahdi_hardware
pci:0000:05:0d.0      wcb4xxp-      d161:b410 Digium Wildcard B410P
pci:0000:05:0e.0      wct4xxp-      d161:0205 Wildcard TE205P (4th Gen)
```

This command gives the card name detected and, more importantly, the DAHDI kernel module needed for this card. In the above example you can see that two cards are detected in the system:

- a Digium B410P which needs the `wcb4xxp` module
- and a Digium TE205P which needs the `wct4xxp` module

## Create the configuration file

Now that we know the modules we need, we can create our configuration file:

1. Create the file `/etc/dahdi/modules`:

```
touch /etc/dahdi/modules
```

2. Fill it with the modules name you found with the `dahdi_hardware` command (one module name per line). In our example, your `/etc/dahdi/modules` file should contain the following lines:

```
wcb4xxp
wct4xxp
```

**Note:** In the `/usr/share/dahdi/modules.sample` file you can find all the modules supported in your XiVO version.

## Apply the configuration

To apply the configuration, restart the services:

```
xivo-service restart
```

## Next step

Now that you have loaded the correct module for your card you must:

1. check if you need to follow one of the *Specific configuration* sections below,
2. and continue with the next configuration step which is to *configure the echo canceller*.

## Specific configuration

This section lists some specific configuration. You should not follow them unless you have a specific need.

**TE13x, TE23x, TE43x: E1/T1 selection** With E1/T1 cards you must select the correct *line mode* between:

- E1 : the European standard,
- and T1 : North American standard

For old generation cards (TE12x, TE20x, TE40x series) the *line mode* is selected via a physical jumper.

For new generation cards like TE13x, TE23x, TE43x series the *line mode* is selected by configuration.

If you're configuring one of these **TE13x, T23x, T43x** cards then you **MUST** create a configuration file to set the line mode to E1:

1. Create the file `/etc/modprobe.d/xivo-wcte-linemode.conf`:

```
touch /etc/modprobe.d/xivo-wcte-linemode.conf
```

2. Fill it with the following lines replacing `DAHDI_MODULE_NAME` by the correct module name (`wcte13xp`, `wcte43x` ...):

```
# set the card in E1/T1 mode
options DAHDI_MODULE_NAME default_linemode=e1
```

3. Then, restart the services:

```
xivo-service restart
```

## Hardware Echo-cancellation

It is *recommended* to use telephony cards with an hardware echo-canceller module.

**Warning:** with **TE13x**, **TE23x** and **TE43x** cards, you **MUST** install the echo-canceller firmware. Otherwise the card won't work properly.

## Know which firmware you need

If you have an hardware echo-canceller module you **have to** install its firmware.

You first need to know which firmware you have to install. The simplest way is to restart dahdi and then to lookup in the dmesg which firmware does DAHDI request at startup:

```
xivo-service restart
dmesg |grep firmware
[5461540.738209] wct4xxp 0000:01:0e.0: firmware: agent aborted loading dahdi-fw-oct6114-064.bin (
[5461540.738310] wct4xxp 0000:01:0e.0: VPM450: firmware dahdi-fw-oct6114-064.bin not available fr
```

In the example above you can see that the module wct4xxp requested the dahdi-fw-oct6114-064.bin firmware file but did not found it. But you now know that you need the dahdi-fw-oct6114-064.bin firmware.

## Install the firmware

When you know which firmware you need you can install it with xivo-fetchfw utility.

1. Use xivo-fetchfw to find the name of the package. You can search for digium occurrences in the available packages:

```
xivo-fetchfw search digium
```

2. Find the package name which matches the firmware file you need. In our example, we need the dahdi-fw-oct6114-064.bin file which is supplied by the package named digium-oct6114-064:

```
xivo-fetchfw install digium-oct6114-064
```

## Activate the Hardware Echo-cancellation

Now that you installed hardware echo-canceller firmware you must activate it in /etc/asterisk/chan\_dahdi.conf file:

```
echocancel = 1
```

## Apply the configuration

To apply the configuration, restart the services:

```
xivo-service restart
```

## Next step

Now that you have loaded the correct module for your card you must:

1. check if you need to follow one of the *Specific configuration* sections below,
2. and continue with the next configuration step which is to *configure your card* according to the operator links.

## Specific configuration

This section describes some specific configuration. You should not follow them unless you have a specific need.

**Use the Hardware Echo-canceller for DTMF detection** If you have an hardware echo-canceller you *may* want to use it to detect the DTMF signal (instead of asterisk).

1. Create the file `/etc/modprobe.d/xivo-hwec-dtmf.conf`:

```
touch /etc/modprobe.d/xivo-hwec-dtmf.conf
```

2. Fill it with the following lines replacing `DAHDI_MODULE_NAME` by the correct module name (`wcte13xp`, `wct4xxp` ...):

```
options DAHDI_MODULE_NAME vpmdtmfsupport=1
```

3. Then, restart the services:

```
xivo-service restart
```

## Card configuration

Now that you have *loaded the correct DAHDI modules* and *configured the echo canceller* you can proceed with the card configuration. Follow one of the appropriate link below :

### BRI card configuration

**Verifications** Verify that the `wcb4xxp` module is uncommented in `/etc/dahdi/modules`.

If it wasn't, do again the step *Load the correct DAHDI modules*.

**Generate DAHDI configuration** Issue the command:

```
dahdi_genconf
```

**Warning:** it will erase all existing configuration in `/etc/dahdi/system.conf` and `/etc/asterisk/dahdi-channels.conf` files !

## Configure

**DAHDI system.conf configuration** First step is to check `/etc/dahdi/system.conf` file:

- check the span numbering,
- if needed change the clock source,

See detailed explanations of this file in the */etc/dahdi/system.conf* section.

Below is **an example** for a typical french BRI line span:

```
# Span 1: B4/0/1 "B4XXP (PCI) Card 0 Span 1" (MASTER) RED
span=1,1,0,ccs,ami
# termtype: te
bchan=1-2
hardhdlc=3
echocanceller=mg2,1-2
```

**Asterisk dahdi-channels.conf configuration** Then you have to modify the `/etc/asterisk/dahdi-channels.conf` file:

- remove the unused lines like:

```
context = default
group = 63
```

- change the context lines if needed,
- the signalling should be one of:
  - `bri_net`
  - `bri_cpe`
  - `bri_net_ptmp`
  - `bri_cpe_ptmp`

See some explanations of this file in the `/etc/asterisk/dahdi-channels.conf` section.

Below is **an example** for a typical french BRI line span:

```
; Span 1: B4/0/1 "B4XXP (PCI) Card 0 Span 1" (MASTER) RED
group = 0,11 ; belongs to group 0 and 11
context = from-extern ; incoming call to this span will be sent in 'from-extern' context
switchtype = euroisdn
signalling = bri_cpe ; use 'bri_cpe' signalling
channel => 1-2 ; the above configuration applies to channels 1 and 2
```

**Next step** Now that you have configured your BRI card:

1. you must check if you need to follow one of the *Specific configuration* sections below,
2. then, if you have another type of card to configure, you can go back to the *configure your card* section,
3. if you have configured all your card you have to configure the *DAHDI interconnections* in the web interface.

**Specific configuration** You will find below 3 configurations that we recommend for BRI lines. These configurations were tested on different type of french BRI lines with success.

---

**Note:** The pre-requisites are:

- XiVO >= 14.12,
  - Use per-port dahdi interconnection (see the *DAHDI interconnections* section)
- 

If you don't know which one to configure we recommend that you try each one after the other in this order:

1. *PTMP without layer1/layer2 persistence*
2. *PTMP with layer1/layer2 persistence*
3. *PTP with layer1/layer2 persistence*

**PTMP without layer1/layer2 persistence** In this mode we will configure asterisk and DAHDI:

- to use Point-to-Multipoint (PTMP) signalling,
- and to leave Layer1 and Layer2 DOWN

Follow these steps to configure:

1. **Before** the line `#include dahdi-channels.conf` add, in file `/etc/asterisk/chan_dahdi.conf`, the following lines:

```
layer1_presence = ignore
layer2_persistence = leave_down
```

2. In the file `/etc/asterisk/dahdi-channels.conf` use `bri_cpe_ptmp` signalling:

```
signalling = bri_cpe_ptmp
```

3. Create the file `/etc/modprobe.d/xivo-wcb4xxp.conf` to deactivate the layer1 persistence:

```
touch /etc/modprobe.d/xivo-wcb4xxp.conf
```

4. Fill it with the following content:

```
options wcb4xxp persistentlayer1=0
```

5. Then, apply the configuration by restarting the services:

```
xivo-service restart
```

---

**Note:** Expected behavior:

- The `dahdi show status` command should show the BRI spans in *RED* status if there is no call,
  - For outgoing calls the layer1/layer2 should be brought back up by the XiVO (i.e. asterisk/chan\_dahdi),
  - For incoming calls the layer1/layer2 should be brought back up by the operator,
  - You can consider that there is *a problem* only if incoming or outgoing calls are rejected.
- 

**PTMP with layer1/layer2 persistence** In this mode we will configure asterisk and DAHDI:

- to use Point-to-Multipoint (PTMP) signalling,
- and to keep Layer1 and Layer2 UP

Follow these steps to configure:

1. **Before** the line `#include dahdi-channels.conf` add, in file `/etc/asterisk/chan_dahdi.conf`, the following lines:

```
layer1_presence = required
layer2_persistence = keep_up
```

2. In the file `/etc/asterisk/dahdi-channels.conf` use `bri_cpe_ptmp` signalling:

```
signalling = bri_cpe_ptmp
```

3. If it exists, delete the file `/etc/modprobe.d/xivo-wcb4xxp.conf`:

```
rm /etc/modprobe.d/xivo-wcb4xxp.conf
```

4. Then, apply the configuration by restarting the services:

```
xivo-service restart
```

**Note:** Expected behavior:

- The *dahdi show status* command should show the BRI spans in **OK** status even if there is no call,
  - In asterisk CLI you may see the spans going Up/Down/Up : it is *a problem* only if incoming or outgoing calls are rejected.
- 

**PTP with layer1/layer2 persistence** In this mode we will configure asterisk and DAHDI:

- to use Point-to-Point (PTP) signalling,
- and use default behavior for Layer1 and Layer2.

Follow these steps to configure:

1. In file `/etc/asterisk/chan_dahdi.conf` remove all occurrences of `layer1_presence` and `layer2_persistence` options.
2. In the file `/etc/asterisk/dahdi-channels.conf` use `bri_cpe` signalling:

```
signalling = bri_cpe
```

3. If it exists, delete the file `/etc/modprobe.d/xivo-wcb4xxp.conf`:

```
rm /etc/modprobe.d/xivo-wcb4xxp.conf
```

4. Then, apply the configuration by restarting the services:

```
xivo-service restart
```

**Note:** Expected behavior:

- The *dahdi show status* command should show the BRI spans in **OK** status even if there is no call,
  - In asterisk CLI you should not see the spans going Up and Down : if it happens, it is *a problem* only if incoming or outgoing calls are rejected.
- 

## PRI card configuration

**Verifications** Verify that the correct module is configured in `/etc/dahdi/modules` depending on the card you installed in your server.

If it wasn't, do again the step [Load the correct DAHDI modules](#)

**Warning:** *TE13x, TE23x, TE43x* cards :

- these cards need a specific dahdi module configuration. See [TE13x, TE23x, TE43x: E1/T1 selection](#) paragraph,
- you **MUST** install the correct echo-canceller firmware to be able to use these cards. See [Hardware Echo-cancellation](#) paragraph.

**Generate DAHDI configuration** Issue the command:

```
dahdi_genconf
```

**Warning:** it will erase all existing configuration in `/etc/dahdi/system.conf` and `/etc/asterisk/dahdi-channels.conf` files !

## Configure

**DAHDI system.conf configuration** First step is to check `/etc/DAHDI/system.conf` file:

- check the span numbering,
- if needed change the clock source,
- usually (at least in France) you should remove the `crc4`

See detailed explanations of this file in the `/etc/DAHDI/system.conf` section.

Below is **an example** for a typical french PRI line span:

```
# Span 1: TE2/0/1 "T2XXP (PCI) Card 0 Span 1" CCS/HDB3/CRC4 RED
span=1,1,0,ccs,hdb3
# termtype: te
bchan=1-15,17-31
dchan=16
echocanceller=mg2,1-15,17-31
```

**Asterisk dahdi-channels.conf configuration** Then you have to modify the `/etc/asterisk/DAHDI-channels.conf` file:

- remove the unused lines like:

```
context = default
group = 63
```

- change the context lines if needed,
- the signalling should be one of:
  - `pri_net`
  - `pri_cpe`

Below is **an example** for a typical french PRI line span:

```
; Span 1: TE2/0/1 "T2XXP (PCI) Card 0 Span 1" CCS/HDB3/CRC4 RED
group = 0,11 ; belongs to group 0 and 11
context = from-extern ; incoming call to this span will be sent in 'from-extern' context
switchtype = euroisdn
signalling = pri_cpe ; use 'pri_cpe' signalling
channel => 1-15,17-31 ; the above configuration applies to channels 1 to 15 and 17 to 31
```

**Next step** Now that you have configured your PRI card:

1. you must check if you need to follow one of the *Specific configuration* sections below,
2. then, if you have another type of card to configure, you can go back to the *configure your card* section,
3. if you have configured all your card you have to configure the *DAHDI interconnections* in the web interface.

## Specific configuration

**Multiple PRI cards and sync cable** If you have several PRI cards in your server you should link them with a synchronization cable to share the exact same clock.

To do this, you need to:

- use the coding wheel on the Digium cards to give them an order of recognition in DAHDI/Asterisk (see [Digium\\_telephony\\_cards\\_support](#)),
- daisy-chain the cards with a sync cable (see [Digium\\_telephony\\_cards\\_support](#)),

- load the DAHDI module with the `timingcable=1` option.

Create `/etc/modprobe.d/xivo-timingcable.conf` file and insert the line:

```
options DAHDI_MODULE_NAME timingcable=1
```

Where `DAHDI_MODULE_NAME` is the DAHDI module name of your card (e.g. `wct4xxp` for a TE205P).

## Analog card configuration

### Limitations

- XiVO does not support hardware echocanceller on the TDM400 card. Users of TDM400 card willing to setup an echocanceller will have to use a software echocanceller like OSLEC.

**Verifications** Verify that one of the `{wctdm,wctdm24xxp}` module is uncommented in `/etc/dahdi/modules` depending on the card you installed in your server.

If it wasn't, do again the step [Load the correct DAHDI modules](#)

---

**Note:** Analog cards work with card module. You must add the appropriate card module to your analog card. Either:

- an FXS module (for analog equipment - phones, ...),
  - an FXO module (for analog line)
- 

**Generate DAHDI configuration** Issue the command:

```
dahdi_genconf
```

**Warning:** it will erase all existing configuration in `/etc/dahdi/system.conf` and `/etc/asterisk/dahdi-channels.conf` files !

## Configure

**DAHDI system.conf configuration** First step is to check `/etc/dahdi/system.conf` file:

- check the span numbering,

See detailed explanations of this file in the [/etc/dahdi/system.conf](#) section.

Below is **an example** for a typical FXS analog line span:

```
# Span 2: WCTDM/4 "Wildcard TDM400P REV I Board 5"
fxoks=32
echocanceller=mg2,32
```

**Asterisk dahdi-channels.conf configuration** Then you have to modify the `/etc/asterisk/dahdi-channels.conf` file:

- remove the unused lines like:

```
context = default
group = 63
```

- change the context and callerid lines if needed,
- the signalling should be one of:

- fxo\_ks for **FXS** lines -yes it is the reverse
- fxs\_ks for **FXO** lines - yes it is the reverse

Below is **an example** for a typical french PRI line span:

```
; Span 2: WCTDM/4 "Wildcard TDM400P REV I Board 5"
signalling=fxo_ks
callerid="Channel 32" <4032>
mailbox=4032
group=5
context=default
channel => 32
```

**Next step** Now that you have configured your PRI card:

1. you must check if you need to follow one of the *Specific configuration* sections below,
2. then, if you have another type of card to configure, you can go back to the *configure your card* section,
3. if you have configured all your card you have to configure the *DAHDI interconnections* in the web interface.

### Specific configuration

**FXS modules** If you use **FXS** modules you should create the file `/etc/modprobe.d/xivo-tdm` and insert the line:

```
options DAHDI_MODULE_NAME fastringer=1 booststringer=1
```

Where DAHDI\_MODULE\_NAME is the DAHDI module name of your card (e.g. wctdm for a TDM400P).

**FXO modules** If you use **FXO** modules you should create file `/etc/modprobe.d/xivo-tdm`:

```
options DAHDI_MODULE_NAME opermode=FRANCE
```

Where DAHDI\_MODULE\_NAME is the DAHDI module name of your card (e.g. wctdm for a TDM400P).

### Voice Compression Card configuration

**Verifications** Verify that the `wctc4xxp` module is uncommented in `/etc/dahdi/modules`.

If it wasn't, do again the step *Load the correct DAHDI modules*.

**Configure** To configure the card you have to:

1. Install the card firmware:

```
xivo-fetchfw install digium-tc400m
```

2. Comment out the following line in `/etc/asterisk/modules.conf`:

```
noload = codec_dahdi.so
```

3. Restart asterisk:

```
/etc/init.d/asterisk restart
```

**Next step** Now that you have configured your Voice Compression card:

1. you must check if you need to follow one of the *Specific configuration* sections below,
2. then, if you have another type of card to configure, you can go back to the *configure your card* section.

## Specific configuration

**Select the transcoding mode** The Digium TC400 card can be used to transcode:

- 120 G.729a channels,
- 92 G.723.1 channels,
- or 92 G.729a/G.723.1 channels.

Depending on the codec you want to transcode, you can modify the `mode` parameter which can take the following value:

- `mode = mixed` : this the default value which activates transcoding for 92 channels in G.729a or G.723.1 (5.3 Kbit and 6.3 Kbit)
- `mode = g729` : this option activates transcoding for 120 channels in G.729a
- `mode = g723` : this option activates transcoding for 92 channels in G.723.1 (5.3 Kbit et 6.3 Kbit)

1. Create the file `/etc/modprobe.d/xivo-transcode.conf`:

```
touch /etc/modprobe.d/xivo-transcode.conf
```

2. And insert the following lines:

```
options wtc4xxp mode=g729
```

3. Apply the configuration by restarting the services:

```
xivo-service restart
```

4. Verify that the card is correctly seen by asterisk with the `transcoder show` CLI command - this command should show the encoders/decoders registered by the TC400 card:

```
*CLI> transcoder show
0/0 encoders/decoders of 120 channels are in use.
```

## Apply configuration

If you didn't do it already, you have to restart the services to apply the configuration:

```
xivo-service restart
```

At the end of this page you will also find some general notes and DAHDI.

## Notes on configuration files

### `/etc/dahdi/system.conf`

A *span* is created for each card port. Below is an example of a standard E1 port:

```
span=1,1,0,ccs,hdb3
dchan=16
bchan=1-15,17-31
echocanceller=mg2,1-15,17-31
```

Each span has to be declared with the following information:

```
span=<spannum>,<timing>,<LBO>,<framing>,<coding>[,crc4]
```

- `spannum` : corresponds to the span number. It starts to 1 and has to be incremented by 1 at each new span. This number **MUST** be unique.
- `timing` : describes the how this span will be considered regarding the synchronization :

- 0 : do not use this span as a synchronization source,
- 1 : use this span as the primary synchronization source,
- 2 : use this span as the secondary synchronization source etc.
- LBO : 0 (not used)
- framing : correct values are `ccs` or `cas`. For ISDN lines, `ccs` is used.
- coding : correct values are `hdb3` or `ami`. For example, `hdb3` is used for an E1 (PRI) link, whereas `ami` is used for T0 (french BRI) link.
- `crc4` : this is a framing option for PRI lines. For example it is rarely use in France.

Note that the `dahdi_genconf` command should usually give you the correct parameters (if you correctly set the cards jumper). All these information should be checked with your operator.

#### `/etc/asterisk/chan_dahdi.conf`

This file contains the general parameters of the DAHDI channel. It is not generated via the `dahdi_genconf` command.

#### `/etc/asterisk/dahdi-channels.conf`

This file contains the parameters of each channel. It is generated via the `dahdi_genconf` command.

Below is an example of span definition:

```
group=0,11
context=from-extern
switchtype = euroisdn
signalling = pri_cpe
channel => 1-15,17-31
```

Note that parameters are read from top to bottom in a last match fashion and are applied to the given channels when it reads a line `channel =>`.

Here the channels 1 to 15 and 17 to 31 (it is a typical E1) are set:

- in groups 0 and 11 (see [DAHDI interconnections](#))
- in context `from-extern` : all calls received on these channels will be sent in the context `from-extern`
- and configured with `switchtype euroisdn` and `signalling pri_cpe`

## Debug

### Check IRQ misses

It's always useful to verify if there isn't any *missed IRQ* problem with the cards.

Check:

```
cat /proc/dahdi/<span number>
```

If the *IRQ misses* counter increments, it's not good:

```
cat /proc/dahdi/1
Span 1: WCTDM/0 "Wildcard TDM800P Board 1" (MASTER)
IRQ misses: 1762187
 1 WCTDM/0/0 FXOKS (In use)
 2 WCTDM/0/1 FXOKS (In use)
```

3	WCTDM/0/2	FXOKS	(In use)
4	WCTDM/0/3	FXOKS	(In use)

Digium gives some hints in their *Knowledge Base* here : <http://kb.digium.com/entry/1/63/>

PRI Digium cards needs 1000 interruption per seconds. If the system cannot supply them, it increment the IRQ missed counter.

As indicated in Digium *KB* you should avoid shared IRQ with other equipments (like HD or NIC interfaces).

## 1.8.19 Incall

### General Configuration

You can configure incoming calls settings in *Services* → *IPBX* → *Call Management* → *Incoming calls*.

### DID (Direct Inward Dialing) Configuration

When a “+” character is prepended a called DID, the “+” character is discarded.

Example:

Bob has a DID with number 1000. Alice can call Bob by dialing either 1000 or +1000, without configuring another DID.

## 1.8.20 Interconnections

### Interconnect two XiVO directly

Fig. 1.49: Situation diagram

Interconnecting two XiVO will allow you to send and receive calls between the users configured on both sides.

The steps to configure the interconnections are:

- Establish the trunk between the two XiVO, that is the SIP connection between the two servers
- Configure outgoing calls on the server(s) used to emit calls
- Configure incoming calls on the server(s) used to receive calls

For now, only SIP interconnections have been tested.

## Establish the trunk

The settings below allow a trunk to be used in both directions, so it doesn't matter which server is A and which is B.

Consider XiVO A wants to establish a trunk with XiVO B.

On XiVO B, go on page *Services* → *IPBX* → *Trunk management* → *SIP Protocol*, and create a SIP trunk:

```
Name : xivo-trunk
Username: xivo-trunk
Password: pass
Connection type: Friend
IP addressing type: Dynamic
Context: <see below>
```

**Note:** For the moment, Name and Username need to be the same string.

The Context field will determine which extensions will be reachable by the other side of the trunk:

- If Context is set to default, then every user, group, conf room, queue, etc. that have an extension if the default context will be reachable directly by the other end of the trunk. This setting can ease configuration if you manage both ends of the trunk.
- If you are establishing a trunk with a provider, you probably don't want everything to be available to everyone else, so you can set the Context field to Incalls. By default, there is no extension available in this context, so we will be able to configure which extension are reachable by the other end. This is the role of the incoming calls: making bridges from the Incalls context to other contexts.

On XiVO A, create the other end of the SIP trunk on the *Services* → *IPBX* → *Trunk management* → *SIP Protocol*:

```
Name: xivo-trunk
Username: xivo-trunk
Password: pass
Identified by: Friend
Connection type: Static
Address: <XiVO B IP address or hostname>
Context: Incalls
```

Register tab:

```
Register: checked
Transport: udp
Username: xivo-trunk
Password: pass
Remote server: <XiVO B IP address or hostname>
```

On both XiVO, activate some codecs, *Services* → *IPBX* → *General Settings* → *SIP protocol*, tab Signaling:

```
Enabled codecs: at least GSM (audio)
```

At that point, the Asterisk command `sip show registry` on XiVO B should print a line showing that XiVO A is registered, meaning your trunk is established.

## Set the outgoing calls

The outgoing calls configuration will allow XiVO to know which extensions will be called through the trunk.

On the call emitting server(s), go on the page *Services* → *IPBX* → *Call management* → *Outgoing calls* and add an outgoing call.

Tab General:

```
Trunks: xivo-trunk
```

Tab Exten:

```
Exten: **99. (note the period at the end)
Stripnum: 4
```

This will tell XiVO: if any extension begins with `**99`, then try to dial it on the trunk `xivo-trunk`, after removing the 4 first characters (the `**99` prefix).

The most useful special characters to match extensions are:

```
. (period): will match one or more characters
X: will match only one character
```

You can find more details about pattern matching in Asterisk (hence in XiVO) on [the Asterisk wiki](#).

### Set the incoming calls

Now that we have calls going out from a XiVO, we need to route incoming calls on the XiVO destination.

---

**Note:** This step is only necessary if the trunk is linked to an Incoming calls context.

---

To route an incoming call to the right destination in the right context, we will create an incoming call in *Services* → *IPBX* → *Call management* → *Incoming calls*.

Tab General:

```
DID: 101
Context: Incalls
Destination: User
Redirect to: someone
```

This will tell XiVO: if you receive an incoming call to the extension `101` in the context `Incalls`, then route it to the user `someone`. The destination context will be found automatically, depending on the context of the line of the given user.

So, with the outgoing call set earlier on XiVO A, and with the incoming call above set on XiVO B, a user on XiVO A will dial `**99101`, and the user `someone` will ring on XiVO B.

### Interconnect a XiVO to a VoIP provider

When you want to send and receive calls to the global telephony network, one option is to subscribe to a VoIP provider. To receive calls, your XiVO needs to tell your provider that it is ready and to which IP the calls must be sent. To send calls, your XiVO needs to authenticate itself, so that the provider knows that your XiVO is authorized to send calls and whose account must be credited with the call fare.

The steps to configure the interconnections are:

- Establish the trunk between the two XiVO, that is the SIP connection between the two servers
- Configure outgoing calls on the server(s) used to emit calls
- Configure incoming calls on the server(s) used to receive calls

### Establish the trunk

You need the following information from your provider:

- a username

- a password
- the name of the provider VoIP server
- a public phone number

On your XiVO, go on page *Services* → *IPBX* → *Trunk management* → *SIP Protocol*, and create a SIP/IAX trunk:

```
Name : provider_username
Username: provider_username
Password: provider_password
Connection type: Peer
IP addressing type: voip.provider.example.com
Context: Incalls (or another incoming call context)
```

Register tab:

```
Register: checked
Transport: udp
Name: provider_username
Username: provider_username
Password: provider_password
Remote server: voip.provider.example.com
```

---

**Note:** For the moment, Name and Username need to be the same value.

---

If your XiVO is behind a NAT device or a firewall, you should set the following:

```
Monitoring: 2000 milliseconds
```

This option will make Asterisk send a signal to the VoIP provider server every 2 seconds, so that NATs and firewall know the connection is still alive.

At that point, the Asterisk command `sip show registry` should print a line showing that you are registered, meaning your trunk is established.

### Set the outgoing calls

The outgoing calls configuration will allow XiVO to know which extensions will be called through the trunk.

Go on the page *Services* → *IPBX* → *Call management* → *Outgoing calls* and add an outgoing call.

Tab General:

```
Trunks: provider_username
```

Tab Exten:

```
Exten: 418. (note the period at the end)
```

This will tell XiVO: if an internal user dials a number beginning with 418, then try to dial it on the trunk `provider_username`.

The most useful special characters to match extensions are:

```
. (period): will match one or more characters
X: will match only one character
```

You can find more details about pattern matching in Asterisk (hence in XiVO) on [the Asterisk wiki](#).

## Set the incoming calls

Now that we have calls going out, we need to route incoming calls.

To route an incoming call to the right destination in the right context, we will create an incoming call in *Services* → *IPBX* → *Call management* → *Incoming calls*.

Tab General:

```
DID: your_public_phone_number
Context: Incalls (the same than configured in the trunk)
Destination: User
Redirect to: the_front_desk_guy
```

This will tell XiVO: if you receive an incoming call to the public phone number in the context `Incalls`, then route it to the user `the_front_desk_guy`. The destination context will be found automatically, depending on the context of the line of the given user.

## Interconnect a XiVO to a PBX via an ISDN link

The goal of this architecture can be one of:

- start a smooth migration between an old telephony system towards IP telephony with XiVO
- bring new features to the PBX like voicemail, conference, IVR etc.

First, XiVO is to be integrated transparently between the operator and the PBX. Then users or features are to be migrated from the PBX to the XiVO. It requires a special call routing configuration both on the XiVO and on the PBX.

Fig. 1.50: Interconnect a XiVO to a PBX

## Hardware

**General uses** You must have an ISDN card able to support both the ISDN provider and ISDN links with PBX.

**Note:** If you have two ISDN provider links to PBX, XiVO should have a card with 4 spans : two to the provider, and two to the PBX.

**If you use two cards** If you use two cards, you have to :

- Use a cable for clock synchronization between the cards
- Configure the “wheel” to define the cards order in the system. The ISDN links used by XiVO to synchronize have to be plugged on the card number one!

Please refer to the section [Sync cable](#)

## Configuration

You have now to configure two files :

1. `/etc/dahdi/system.conf`
2. `/etc/asterisk/dahdi-channels.conf`

### system.conf

#### Clock configuration

- Provider side - XiVO will get the clock from the provider : the `timing` value is to be different from 0 (see [/etc/dahdi/system.conf](#) section)
- PBX side - XiVO will provide the clock to the PBX : the `timing` value is to be set to 0 (see [/etc/dahdi/system.conf](#) section)

**Example** Below an example for interconnection with two ISDN provider:

```
# Span 1: TE4/0/1 "TE4XXP (PCI) Card 0 Span 1" (MASTER)
span=1,1,0,ccs,hdb3          # Span towards Provider
bchan=1-15,17-31
dchan=16
echocanceller=mg2,1-15,17-31

# Span 2: TE4/0/2 "TE4XXP (PCI) Card 0 Span 2"
span=2,2,0,ccs,hdb3          # Span towards Provider
bchan=32-46,48-62
dchan=47
echocanceller=mg2,32-46,48-62

# Span 3: TE4/0/3 "TE4XXP (PCI) Card 0 Span 3"
span=3,0,0,ccs,hdb3          # Span towards PBX
bchan=63-77,79-93
dchan=78
echocanceller=mg2,63-77,79-93

# Span 4: TE4/0/4 "TE4XXP (PCI) Card 0 Span 4"
span=4,0,0,ccs,hdb3          # Span towards PBX
bchan=94-108,110-124
dchan=109
echocanceller=mg2,94-108,110-124
```

### dahdi-channels.conf

**Configuraton** Modify the file `/etc/asterisk/dahdi-channels.conf`

```
group : g0 provider side, g2 PBX side
context : from-extern or from-pabx
signalling : pri_cpe provider side, pri_net PBX side
```

**Warning:** Towards certain destinations, some PBX use an overlapdialing (digits are sent one by one). In this case, we have to activate a parameter on the spans concerned:

```
overlapdial = incoming
```

This can be seen with “pri intense debug”

Below an example of `:file:/etc/asterisk/dahdi-channels.conf`. Be careful to three parameters :

- group
- context
- signalling

### Example

```
; Span 1: TE4/0/1 "TE4XXP (PCI) Card 0 Span 1" (MASTER)
group=0,11
context=from-extern
switchtype = euroisdn
signalling = pri_cpe
channel => 1-15,17-31

; Span 2: TE4/0/2 "TE4XXP (PCI) Card 0 Span 2"
group=0,12
context=from-extern
switchtype = euroisdn
signalling = pri_cpe
channel => 32-46,48-62

; Span 3: TE4/0/3 "TE2XXP (PCI) Card 0 Span 3"
group=2,13
context=from-pabx
overlapdial=incoming
switchtype = euroisdn
signalling = pri_net
channel => 63-77,79-93

; Span 4: TE4/0/4 "T4XXP (PCI) Card 0 Span 4"
group=2,14
context=from-pabx
overlapdial=incoming
switchtype = euroisdn
signalling = pri_net
channel => 94-108,110-124
```

### Passthru function

#### Create the “from-pabx” context

- Create a file named `xxxxx.conf` (where `xxxxx` is the customer name) in the directory `/etc/asterisk/extensions_extra.d/`.
- Add the following lines in the file:

```
[from-pabx]
exten = _X.,1,NoOp(« Appel depuis Pabx »)
exten = _X.,n,goto(default,${EXTEN},1)
```

This dialplan allows to route incoming calls from the PBX in the default context of XiVO. Then, calls are routed :

- Or to a SIP phone (in default context)
- Or to the outgoing (to-extern context included in default context)

**Create the “to-extern” context** In the webi, create a context named “to-pabx” :

```
Name : to-pabx
Display Name : to-pabx
Context type : Outcall
Include sub-contexts : No context inclusion
```

This context allows to route incoming calls from the XiVO to the PBX.

The screenshot shows the 'Contexts > Edit' page in the XiVO web interface. The 'General' tab is selected. The form contains the following fields:

- Name: to-pabx
- Displayed name: Vers PABX
- Entity: Maquette2
- Context type: Outcall
- Include sub-contexts: A table with 0 items selected, a 'Remove all' button, and an 'Add all' button. The table lists three sub-contexts: 'Appels entrants (from-extern)', 'Appels internes (default)', and 'Appels sortants (to-extern)', each with a '+' icon.
- Description: A large text area for the context description.
- Save: A button at the bottom of the form.

Fig. 1.51: to-extern context

**Create incoming calls** In our example, incoming calls on spans 1 and 3 (spans plugged to the provider) are routed by from-extern context. We are going to create a default route to redirect incoming calls to the PBX.

Create an incoming call as below :

```
DID : XXXX (according to the number of digits sent by the provider)
Context : Incoming calls
Destination : Customized
Command : Goto(to-pabx, ${XIVO_DSTNUM}, 1)
```

**Create the interconnections** You have to create two interconnections :

- provider side : dahdi/g0
- PBX side : dahdi/g2

In the menu *Services* → *IPBX* → *Trunk management* → *Customized* page

```
Name : t2-operateur
Interface : dahdi/g0
Contexte : to-extern
```

The second interconnection

**Incoming calls > Add**

Context:

Description:

Fig. 1.53: Customized interconnection

```
Name : t2-pabx
Interface : dahdi/g2
Context : to-pabx
```

Fig. 1.54: Customized interconnection

**Create outgoing calls** You must create two rules of outgoing calls in the menu *Services* → *IPBX* → *Call management* → *Outgoing calls* page

#### 1. Redirect calls to the PBX

```
Name : fsc-pabx
Context : to-pabx
Trunks : choose the "t2-pabx" interconnection
```

Trunks:	
1 items selected	Remove all Add all
↑ t2-pabx (dahdi/g2)	idefisk-maq2 (SIP) +
	jocelyn (SIP) +
	loadtester (SIP) +
	redirection (local) +
	t2colt (dahdi/g0) +
	test-audiocodes (SIP) +
	toulouse (SIP) +

Fig. 1.55: Outgoing call

In the extensions tab

```
exten : XXXX
```

	Extern prefix	Prefix	Exten	Stripnum	Callerid
↓ 1			XXXX	0	

Fig. 1.56: Outgoing call

2. Rename the rule “default” in “fsc-operateur”:

```
Name : fsc-operateur
Context : to-extern
Trunks : choose the "t2-operateur" interconnection
```

In the extensions tab:

```
exten = X.
```

## Create an interconnection

There are three types of interconnections :

- Customized
- SIP
- IAX

### Customized interconnections

Customized interconnections are mainly used for interconnections using DAHDI or Local channels:

- *Name* : it is the name which will appear in the outcall interconnections list,
- *Interface* : this is the channel name (for DAHDI see [DAHDI interconnections](#))
- *Interface suffix* (optional) : a suffix added after the dialed number (in fact the Dial command will dial:

```
<Interface>/<EXTEN><Interface suffix>
```

- *Context* : currently not relevant

**DAHDI interconnections** To use your DAHDI links you must create a customized interconnection.

**Name** : the name of the interconnection like **e1\_span1** or **bri\_port1**

**Interface** : must be of the form dahdi/[group order][group number] where :

- group order is one of :
  - g : pick the first available channel in group, searching from lowest to highest,
  - G : pick the first available channel in group, searching from highest to lowest,
  - r : pick the first available channel in group, going in round-robin fashion (and remembering where it last left off), searching from lowest to highest,
  - R : pick the first available channel in group, going in round-robin fashion (and remembering where it last left off), searching from highest to lowest.
- group number is the group number to which belongs the span as defined in the [/etc/asterisk/dahdi-channels.conf](#).

**Warning:** if you use a BRI card you MUST use per-port dahdi groups. You should not use a group like g0 which spans over several spans.

For example, add an interconnection to the menu *Services* → *IPBX* → *Trunk management* → *Customized*

```
Name : interconnection name
Interface : dahdi/g0
```

## Debug

Interesting Asterisk commands:

```
sip show peers
sip show registry
sip set debug on
```

## Caller ID

When setting up an interconnection with the public network or another PBX, it is possible to set a caller ID in different places. Each way to configure a caller ID has its own use case.

The format for a caller ID is the following "My Name" <9999> If you don't set the number part of the caller ID, the dialplan's number will be used instead. This might not be a good option in most cases.

### Outgoing call caller ID

When you create an outgoing call, it's possible to set it to internal, using the check box in the outgoing call configuration menu. When this option is activated, the caller's caller ID will be forwarded to the trunk. This option is useful when the other side of the trunk can reach the user with its caller ID number.

When the caller's caller ID is not usable to the called party, the outgoing call's caller ID can be fixed to a given value that is more useful to the outside world. Giving the public number here might be a good idea.

A user can also have a forced caller ID for outgoing calls. This can be useful for someone who has his own public number. This option can be set in the user's configuration page. The Outgoing Caller ID option must be set to Customize. The user can also set his outgoing caller ID to anonymous.

The order of precedence when setting the caller ID in multiple places is the following.

1. Internal
2. User's outgoing caller ID
3. Outgoing call
4. Default caller ID

## 1.8.21 Interactive Voice Response

### Introduction

*Interactive voice response (IVR) is a technology that allows a computer to interact with humans through the use of voice and DTMF tones input via keypad. In telecommunications, IVR allows customers to interact with a company's host system via a telephone keypad or by speech recognition, after which they can service their own inquiries by following the IVR dialogue.*

—Wikipedia

The IVR function is not yet available in graphic mode in XiVO. This functionality is currently supported using scripts, also named dialplan.

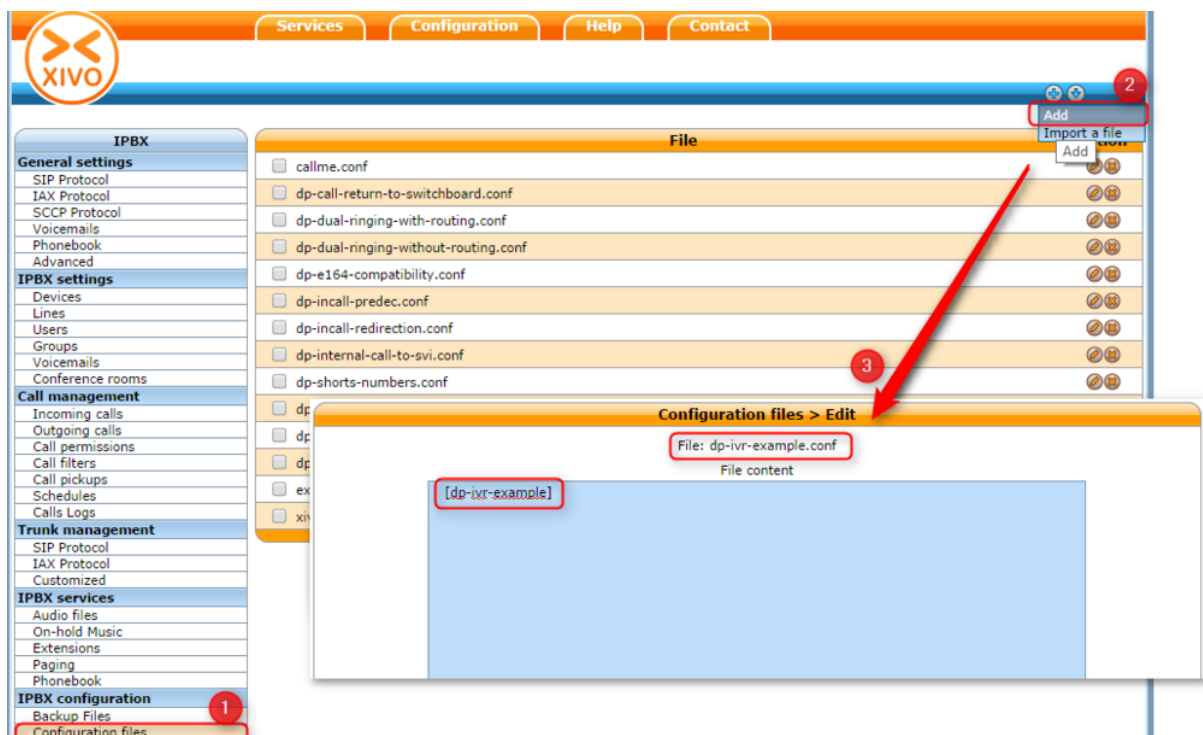

### Use Case: Minimal IVR

#### Flowchart

#### Configuration File and Dialplan

First step, you need to create a configuration file, that contain an asterisk context and your IVR dialplan. In our example, both (file and context) are named dp-ivr-example.

Copy all these lines in the newly created configuration file (in our case, dp-ivr-example) :

```
[dp-ivr-example]

exten = s,1,NoOp(### dp-ivr-example.conf ###)
```

```

same = n,NoOp(Set the context containing your ivr destinations.)
same = n,Set(IVR_DESTINATION_CONTEXT=my-ivr-destination-context)
same = n,NoOp(Set the directory containing your ivr sounds.)
same = n,Set(GV_DIRECTORY_SOUNDS=/var/lib/xivo/sounds/ivr-sounds)
same = n,NoOp(the system answers the call and waits for 1 second before continuing)
same = n,Answer(1000)

same = n,NoOp(the system plays the first part of the audio file "welcome to ...")
same = n(first),Playback(${GV_DIRECTORY_SOUNDS}/ivr-example-welcome-sound)

same = n,NoOp(variable "counter" is set to 0)
same = n(beginning),Set(counter=0)

same = n,NoOp(variable "counter" is incremented and the label "start" is defined)
same = n(start),Set(counter=${counter} + 1)

same = n,NoOp(counter variable is now = ${counter})
same = n,NoOp(waiting for 1 second before reading the message that indicate all choices)
same = n,Wait(1)
same = n,NoOp(play the message ivr-example-choices that contain all choices)
same = n,Background(${GV_DIRECTORY_SOUNDS}/ivr-example-choices)
same = n,NoOp(waiting for DTMF during 5s)
same = n,Waitexten(5)

;##### CHOICE 1 #####
exten = 1,1,NoOp(pressed digit is 1, redirect to 8000 in ${IVR_DESTINATION_CONTEXT} context)
exten = 1,n,Goto(${IVR_DESTINATION_CONTEXT},8000,1)

;##### CHOICE 2 #####
exten = 2,1,NoOp(pressed digit is 2, redirect to 8833 in ${IVR_DESTINATION_CONTEXT} context)
exten = 2,n,Goto(${IVR_DESTINATION_CONTEXT},8833,1)

;##### CHOICE 3 #####
exten = 3,1,NoOp(pressed digit is 3, redirect to 8547 in ${IVR_DESTINATION_CONTEXT} context)
exten = 3,n,Goto(${IVR_DESTINATION_CONTEXT},8547,1)

;##### CHOICE 4 #####
exten = 4,1,NoOp(pressed digit is 4, redirect to start label in this context)
exten = 4,n,Goto(s,start)

;##### TIMEOUT #####
exten = t,1,NoOp(no digit pressed for 5s, process it like an error)
exten = t,n,Goto(i,1)

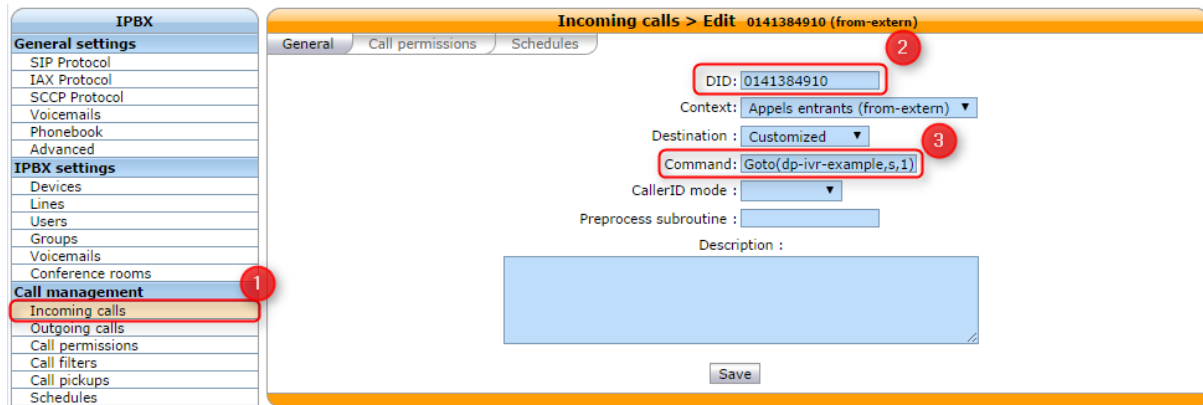

;##### INVALID CHOICE #####
exten = i,1,NoOp(if counter variable is 3 or more, then goto label "error")
exten = i,n,GotoIf(${counter}>=3?error)
exten = i,n,NoOp(pressed digit is invalid and less than 3 errors: the guide ivr-example-invalid-choice)
exten = i,n,Playback(${GV_DIRECTORY_SOUNDS}/ivr-example-invalid-choice)
exten = i,n,Goto(s,start)
exten = i,n(error),Playback(${GV_DIRECTORY_SOUNDS}/ivr-example-error)
exten = i,n,Hangup()

```

### IVR external dial

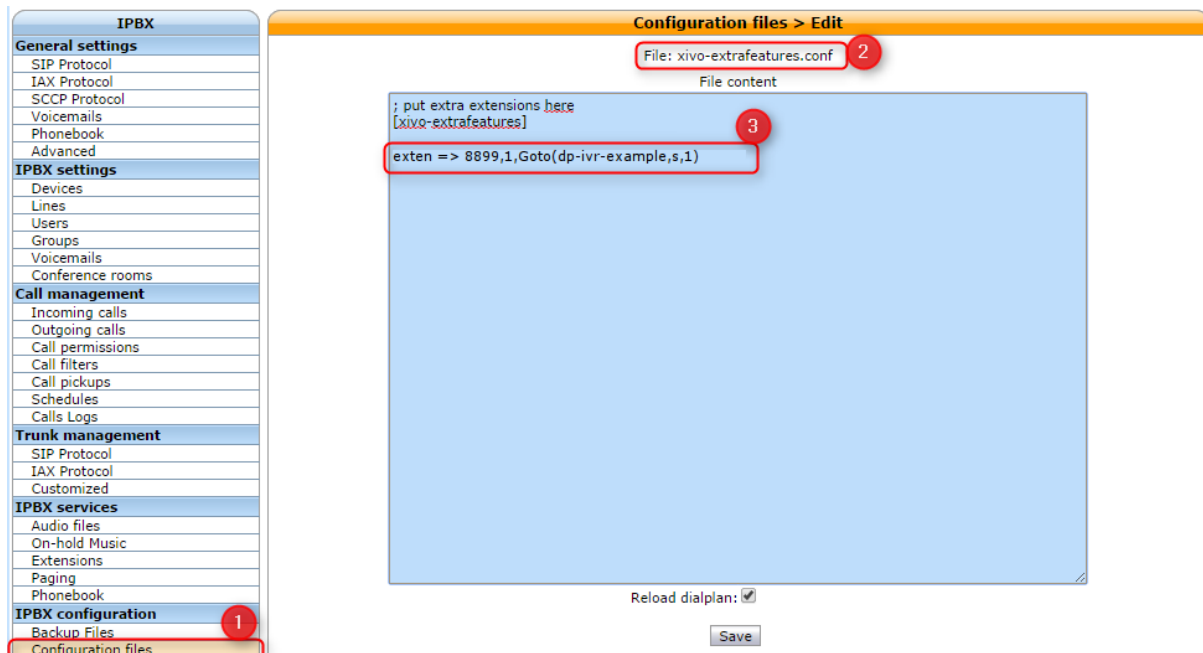

To call the script `dp-ivr-example` from an external phone, you must create an incoming call and redirect the call to the script `dp-ivr-example` with the command :

```
Goto(dp-ivr-example,s,1)
```

## IVR internal dial

To call the script `dp-ivr-example` from an internal phone you must create an entry in the default context (`xivo-extrafeatures` is included in default). The best way is to add the extension in the file `xivo-extrafeatures.conf`.

```
exten => 8899,1,Goto(dp-ivr-example,s,1)
```

## Use Case: IVR with a schedule

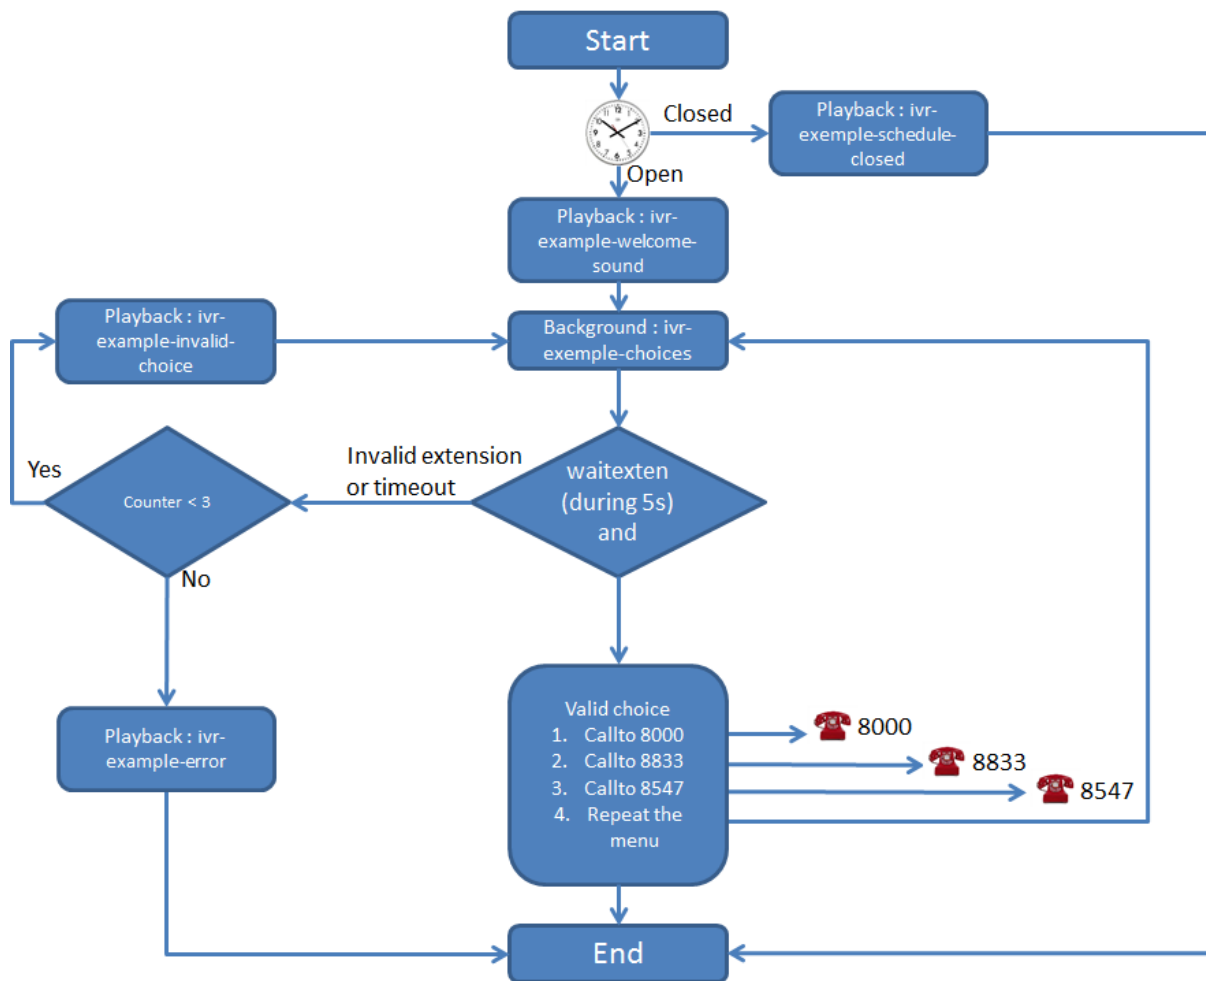

In many cases, you need to associate your IVR to a schedule to indicate when your company is closed.

### Flowchart

#### Create Schedule

First step, create your schedule (1) from the menu *Call management* → *Schedules*. In the General tab, give a name (3) to your schedule and configure the open hours (4) and select the sound which is played when the company is closed.

In the Closed hours tab (6), configure all special closed days (7) and select the sound that indicate to the caller that the company is exceptionally closed.

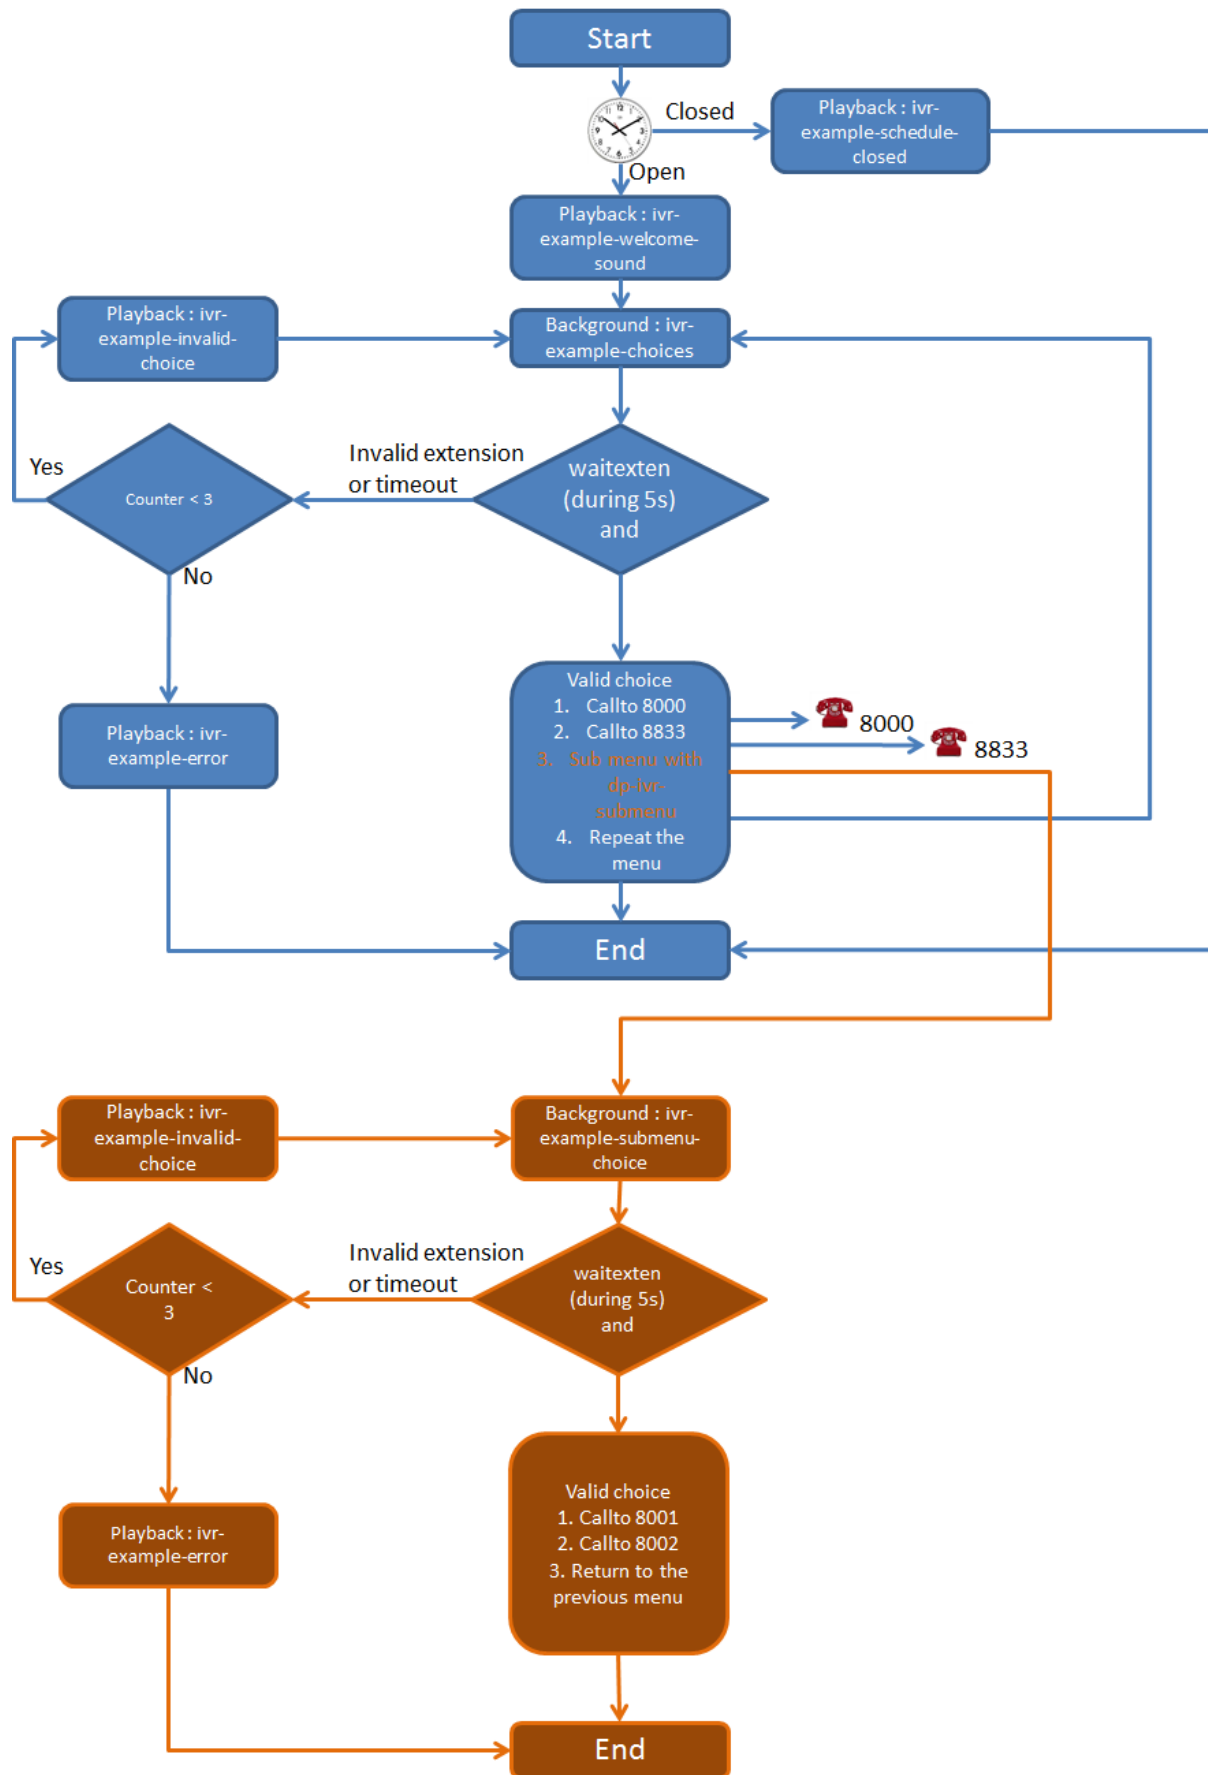

The IVR script is now only available during workdays.

The screenshot displays the XiVO web interface for configuring a schedule. The left sidebar shows the 'Schedules' menu item highlighted. The main area shows the 'Schedules > Edit schedule-company' page. The 'Closed hours' tab is selected. A table lists the schedule: '00h00 to 23h59, Mon to Sun, ...'. The 'Action' column shows 'exceptionnal-closed.wav'. The 'Out of schedule / Default action' section shows 'closed.wav'. Red arrows and numbers 1 through 8 indicate the steps to configure the schedule.

## Assign Schedule to Incall

Return editing your Incall (*Call management* → *Incoming calls*) and assign the newly created schedule in the “Schedules” tab

The screenshot displays the XiVO web interface for configuring an incoming call. The left sidebar shows the 'Schedules' menu item highlighted. The main area shows the 'Incoming calls > Edit 0141384910 (from-extern)' page. The 'Schedules' tab is selected. A dropdown menu shows 'schedule' selected. A 'Save' button is visible.

## Use Case: IVR with submenu

### Flowchart

### Configuration File and Dialplan

Copy all these lines (2 contexts) in a configuration file on your XiVO server :

```
[dp-ivr-example]

exten = s,1,NoOp(### dp-ivr-example.conf ###)
same = n,NoOp(Set the context containing your ivr destinations.)
same = n,Set(IVR_DESTINATION_CONTEXT=my-ivr-destination-context)
same = n,NoOp(Set the directory containing your ivr sounds.)
same = n,Set(GV_DIRECTORY_SOUNDS=/var/lib/xivo/sounds/ivr-sounds)
same = n,NoOp(the system answers the call and waits for 1 second before continuing)
same = n,Answer(1000)

exten = i,n,Playback(${GV_DIRECTORY_SOUNDS}/ivr-example-invalid-choice)
exten = i,n,Goto(s,start)
exten = i,n(error),Playback(${GV_DIRECTORY_SOUNDS}/ivr-example-error)
exten = i,n,Hangup()

```

## 1.8.22 Monitoring

The Monitoring section gives an overview of a XiVO system's status and of all monitored processes. It is divided into 6 sections :

- *System*
- *Device*
- *CPU*
- *Network*

- *Memory*
- *Other Services*

System				
Name	o0-git			
Operating system	Linux			
Kernel version	3.2.0-4-686-pae			
IP address	10.33.255.1			
DNS address	10.33.255.1			
Uptime	1 day(s) 05:44:09			
Load average	0.65 0.73 0.51			

CPU				
Percent	User	System	Wait	
 66.30 %	54.10 %	9.90 %	2.30 %	

Network				
Interface	Received	Transmitted	Error	Drop
lo	222.30 MiB	222.30 MiB	0	0
eth1	19.03 MiB	15.43 MiB	0	0
eth0	40.63 MiB	61.63 MiB	0	0

Device				
Partition	Percent	Free	Used	Total
data-system	 61.70 %	0	3792.1	6138.0
data-var	 58.90 %	0	1683.5	2854.0

Memory						
type	Percent	Free	Used	Buffers	Cached	Total
Physical memory	 59.54 %	9.70 MiB	218.25 MiB	31.25 KiB	138.56 MiB	366.54 MiB
Swap partition	 8.80 %	872.83 MiB	84.20 MiB	-	-	957.03 MiB

Other services

## System

Displays generic information about the operating system, network addresses, uptime and load average. Read only.

## Device

Displays free/used space on physical storage partitions. Read only.

## CPU

Monitors the CPU usage. Read only.

## Network

Displays network interfaces and corresponding network traffic. Read only.

## Memory

Displays Physical and swap memory usage. Read only.

## Other Services

Lists XiVO related processes (most of which are daemons) with their corresponding status, uptime, resource usage and controls to Restart service (blue button), stop service (red button) and stop monitoring service (grey button).

### 1.8.23 Music on Hold

The menu *Services* → *IPBX* → *IPBX services* → *On-hold Music* leads to the list of available on-hold musics.

#### Categories

Available categories are:

- files: play sound files. Formats supported:

Format Name	Filename Extension
G.719	.g719
G.723	.g723 .g723sf
G.726	.g726-40 .g726-32 .g726-24 .g726-16
G.729	.g729
GSM	.gsm
iLBC	.ilbc
Ogg Vorbis	.ogg
G.711 A-law	.alaw .al .alw
G.711 $\mu$ -law	.pcm .ulaw .ul .mu .ulw
G.722	.g722
Au	.au
Siren7	.siren7
Siren14	.siren14
SLN	.raw .sln .sln12 .sln16 .sln24 .sln32 .sln44 .sln48 .sln96 .sln192
VOX	.vox
WAV	.wav .wav16
WAV GSM	.WAV .wav49

See asterisk `-rx 'module show like format'`. The on-hold music will always play from the start.

- mp3: play MP3 files.

The on-hold music will play from an arbitrary position on the track, it will not play from the start.

- custom: do not play sound files. Instead, run an external process. That process must send on stdout the same binary format than WAV files.

Example process: `/usr/bin/mpg123 -s --mono -y -f 8192 -r 8000 http://streaming.example.com/stream.mp3`

---

**Note:** Processes run by custom categories are started as soon as the category is created and will only stop when the category is deleted. This means that on-hold music fed from online streaming will constantly be receiving network traffic, even when there are no calls.

---

### 1.8.24 Paging

With XiVO, you can define paging (i.e. intercom) extensions to page a group of users. When calling a paging extension, the phones of the specified users will auto-answer, if they support it.

You can manage your paging extensions via the *Services* → *IPBX* → *Paging* page.

When adding a new paging extension, the number can be any numeric value; to call it, you just need to prefix the paging number with `*11`.

### 1.8.25 Parking

With XiVO it is possible to park calls, the same way you may park your car in a car parking. If you define supervised keys on a phone set for all the users of a system, when a call is parked, all the users are able to see that some one is waiting for an answer, push the phone key and get the call back to the phone.

There is a default parking number, 700, which is already configured when you install XiVO, but you may change the default configuration by editing the parking extension in menu *Service* → *IPBX* → *IPBX Services* → *Extensions* → *Advanced* → *Parking*

Using this extension, you may define the parking number used to park call, the parking lots, whether the system is rotating over the parking lots to park the calls, enable parking hint if you want to be able to supervise the parking using phone keys and other system default parameters.

You have two options in case of parking timeout :

- Callback the peer that parked this call

In this case the call is sent back to the user who parked the call.

- Send park call to the dialplan

In case you don't want to call back the user who parked the call, you have the option to send the call to any other extension or application. If the parking times out, the call is sent back to the dialplan in context `[parkedcallsttimeout]`. You can define this context in a dialplan configuration file *Service* → *IPBX* → *Configuration Files* where you may define this context with dialplan commands.

Example:

```
[parkedcallsttimeout]
exten = s,1,Noop('park call time out')
same  = n,Playback(hello-world)
same  = n,Hangup()
```

It is also usual to define supervised phone keys to be able to park and unpark calls as in the example below.

### 1.8.26 Phonebook

A global phone book can be defined in *IPBX Service* → *Phone book*. The phone book can be used from the XiVO client, from the phones directory look key if the phone is compatible and are used to set the Caller ID for incoming calls.

---

eral   Voicemail   Agents   **Advanced**

Extension:

Context:

Wait delay:

Extension to parked calls:

Look for the next call: ☐

Parkings hints: ☒

Allow dynamically created parkinglots: ☐

On parkedcall timeout:

Who to play courtesy tone when picking up parked call:

Allow DTMF based transfers when picking up parked call:

Allow DTMF based parking when picking up parked call:

Allow DTMF based hangups when picking up parked call:

Allow DTMF based one-touch recording when picking up parked call:

MOH class to play to parked calls:

Use ADSI announces: ☐

---

<input type="text" value="1"/>	<input type="text" value="User"/>	<input type="text" value="Jean-Yves LEBLEU"/>	<input type="text" value=""/>	<input type="text" value="Enabled"/>	<input type="text" value=""/>
<input type="text" value="4"/>	<input type="text" value="Parking"/>	<input type="text" value="900"/>	<input type="text" value="Parking"/>	<input type="text" value="Disabled"/>	<input type="text" value=""/>
<input type="text" value="5"/>	<input type="text" value="Parking position"/>	<input type="text" value="901"/>	<input type="text" value="701"/>	<input type="text" value="Enabled"/>	<input type="text" value=""/>
<input type="text" value="6"/>	<input type="text" value="Parking position"/>	<input type="text" value="902"/>	<input type="text" value="702"/>	<input type="text" value="Enabled"/>	<input type="text" value=""/>
<input type="text" value="7"/>	<input type="text" value="Parking position"/>	<input type="text" value="903"/>	<input type="text" value="703"/>	<input type="text" value="Enabled"/>	<input type="text" value=""/>
<input type="text" value="8"/>	<input type="text" value="Parking position"/>	<input type="text" value="904"/>	<input type="text" value="704"/>	<input type="text" value="Enabled"/>	<input type="text" value=""/>

You can add entries one by one or you can mass-import from a CSV file.

---

**Note:** This page describes how to use the Phonebook feature of XiVO, which is one specific source of contacts. For other sources of contacts, see [Directories](#), and [LDAP](#).

---

## Mass-import contacts

Go in the *IPBX Services* -> *Phonebook* section and move your mouse cursor on the + button in the upper right corner. Select *Import a file*.

The file to be imported must be a CSV file, with a pipe character | as field delimiter. The file must be encoded in UTF-8 (without an initial **BOM**).

Mandatory headers are :

- title (possible values : “mr”, “mrs”, “ms”)
- displayname

Optional headers are :

- firstname
- lastname
- society
- mobilenumbers<sup>1</sup>
- email
- url
- description
- officenumbers<sup>1</sup>
- faxnumbers<sup>1</sup>
- officeaddress1
- officeaddress2
- officecity
- officestate
- officezipcode
- officecountry<sup>2</sup>
- homenumbers<sup>1</sup>
- homeaddress1
- homeaddress2
- homecity
- homestate
- homezipcode
- homecountry<sup>2</sup>
- othernumbers<sup>1</sup>
- otheraddress1

---

<sup>1</sup> These fields must contain only numeric characters, no space, point, etc.

<sup>2</sup> These fields must contain ISO country codes. The complete list is described [here](#).

- otheraddress2
- othercity
- otherstate
- otherzipcode
- othercountry <sup>2</sup>

## Displayed fields

It's possible to add more fields to the display in the CTI client. The display can be customized in the web interface under *Services -> CTI server -> Directories -> Display filter*.

Fields that can be displayed are set in *Directories -> Definitions -> xivodir*

The field name will be used to refer to this field in the directory display.

The fields in definition can be used with the following syntax `{db-[field-name]}`

## General phone book section

These fields are set in the General tab of the phone book.

- phonebook.description
- phonebook.displayname
- phonebook.email
- phonebook.firstname
- phonebook.fullname (this value is automatically generated as “<firstname> <lastname>”, e.g. “John Doe”)
- phonebook.lastname
- phonebook.society
- phonebook.title
- phonebook.url

## Phone numbers

These are the different phone numbers that are available

- phonebooknumber.fax.number
- phonebooknumber.home.number
- phonebooknumber.mobile.number
- phonebooknumber.office.number
- phonebooknumber.other.number

## Addresses

Each configured address can be accessed

Address uses the following syntax `phonebookaddress.[location].[field]`, e.g. `phonebookaddress.office.zipcode`.

## Locations

- home
- office
- other

## Fields

- address1
- address2
- city
- country
- state
- zipcode

Each line is a field that will be displayed in the Remote Directory xlet.

**Update displays**

Name :

Available display formats : {db-phone} {db-firstname} {db-lastname} {db-fullname} {db-company} {db-mail}

Field title	Field type	Default value	Display format
Nom			{db-firstname} {db-l
Numéro	phone		{db-phone}
Entreprise		Inconnue	{db-company}
E-mail			{db-mail}
Source			{xivo-directory}
Mobile	phone		{db-mobile}

Description

Default display

## Adding the fax to the directory display

1. In the definition section, add a field name *fax* with the value *phonebooknumber.fax.number*.
2. In the display filter section add a field with field title *Fax* and display format *{db-fax}*.
3. Restart the CTI Server

Now the fax should be available displayed in the Remote Directory xlet.

## Reverse lookup

It's possible to do reverse lookups on incoming calls to show a better caller ID name when the caller is in one of our directories.

Reverse lookup will only be tried if at least one of the following conditions is true:

- The caller ID name is the same as the caller ID number
- The caller ID name is "unknown"

Also, reverse lookup is performed after *caller ID number normalization* (since XiVO 13.11).

Some configuration must be in place to enable reverse directory lookups.

### Match reverse fields

The *Match reverse directories* field in *Services* → *CTI Server* → *Directories* → *Definitions* should contains the fields that are used by the reverse lookup. The list is comma separated and each field that appears in this list must also appear in the *Value* column of the *Mapped Fields* section, or the reverse lookup won't work.

Example:

```
phonebooknumber.office.number,phonebooknumber.mobile.number,phonebooknumber.home.number
```

This line would match office, home and mobile numbers on incoming calls.

**Update directories**

Name:

URI:

Delimiter:

Direct match:

Match reverse directories:

Mapped fields:

Fieldname	Value
company	phonebook.society
firstname	phonebook.firstname
fullname	phonebook.fullname
lastname	phonebook.lastname
mail	phonebook.email
mobile	phonebooknumber.mobile.number
phone	phonebooknumber.office.number
reverse	phonebook.society
home	phonebooknumber.home.number

### Displayed field

You have now to define which field should be used to display the result. This is done by defining a mapping between the field named *reverse* on the *Mapped fields* list and a database field.

Examples:

```
reverse => phonebook.society
or
reverse => phonebook.fullname
```

The first example would show the contact's company name on the caller ID name, the second would show his full name.

### Include the directory

To include a directory in reverse directory definition go to *Services* → *CTI Server* → *Directories* → *Reverse directories* and add the directories to include to reverse lookups in the *Related directories* section.

Restart the CTI server and incoming caller IDs should be resolved using the specified directories.

## 1.8.27 Provisioning

XiVO supports the auto-provisioning of a large number of telephony *Devices*, including SIP phones, SIP ATAs, and even softphones.

### Introduction

The auto-provisioning feature found in XiVO make it possible to provision, i.e. configure, a lots of telephony devices in an efficient and effortless way.

### How it works

Here's a simplified view of how auto-provisioning is supported on a typical SIP hardphone:

1. The phone is powered on
2. During its boot process, the phone sends a DHCP request to obtain its network configuration
3. A DHCP server replies with the phone network configuration + an HTTP URL
4. The phone use the provided URL to retrieve a common configuration file, a MAC-specific configuration file, a firmware image and some language files.

Building on this, configuring one of the supported phone on XiVO is as simple as:

1. *Configuring the DHCP Server*
2. *Installing the required provd plugin*
3. Powering on the phone
4. Dialing the user's provisioning code from the phone

And *voila*, once the phone has rebooted, your user is ready to make and receive calls. No manual editing of configuration files nor fiddling in the phone's web interface.

### Limitations

- Device synchronisation does not work in the situation where multiple devices are connected from behind a NAPT network equipment. The devices must be resynchronised manually.

### External links

- [Introduction to provd plugin model](#)
- [HTTP/TFTP requests processing in provd - part 1](#)
- [HTTP/TFTP requests processing in provd - part 2](#)

### Basic Configuration

You have two options to get your phone to be provisioned:

- Set up a DHCP server
- Tell manually each phone where to get the provisioning informations

You may want to manually configure the phones if you are only trying XiVO or if your network configuration does not allow the phones to access the XiVO DHCP server.

You may want to set up a DHCP server if you have a significant number of phones to connect, as no manual intervention will be required on each phone.

## Configuring the DHCP Server

XiVO includes a DHCP server that facilitate the auto-provisioning of telephony devices. It is *not* activated by default.

There's a few things to know about the peculiarities of the included DHCP server:

- it only answers to DHCP requests from *supported devices*.
- it only answers to DHCP requests coming from the VoIP subnet (see *network configuration*).

This means that if your phones are on the same broadcast domain than your computers, and you would like the DHCP server on your XiVO to handle both your phones and your computers, that won't do it.

The DHCP server is configured via the *Configuration* → *Network* → *DHCP* page:

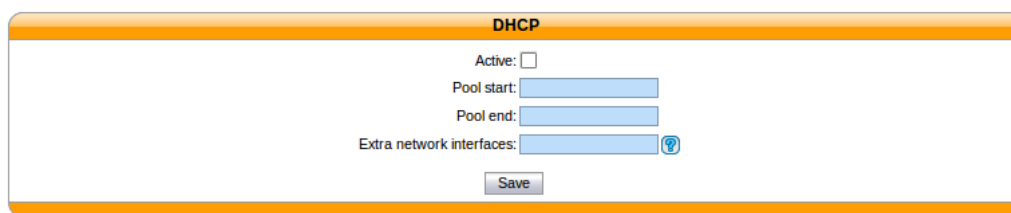

Fig. 1.57: *Configuration* → *Network* → *DHCP*

**Active** Activate/desactivate the DHCP server.

**Pool start** The lower IP address which will be assigned dynamically. This address should be in the VoIP subnet.  
Example: 10.0.0.10.

**Pool end** The higher IP address which will be assigned dynamically. This address should be in the VoIP subnet.  
Example: 10.0.0.99.

**Extra network interfaces** A list of space-separated network interface name. Example: eth0.

Useful if you have done some custom configuration in the `/etc/dhcp/dhcpd_extra.conf` file. You need to explicitly specify the additional interfaces the DHCP server should listen on.

After saving your modifications, you need to click on *Apply system configuration* for them to be applied.

## Installing provd Plugins

The installation and management of `provd` plugins is done via the *Configuration* → *Provisioning* → *Plugin* page:

The page shows the list of both the installed and installable plugins. You can see if a plugin is installed or not by looking at the *Action* column.

Here's the list of other things that can be done from this page:

- update the list of installable plugins, by clicking on the top right icon. On a fresh XiVO installation, this is the first thing to do.
- install a new plugin
- upgrade an installed plugin
- uninstall an installed plugin
- edit an installed plugin, i.e. install/uninstall optional files that are specific to each plugin, like firmware or language files

After installing a new plugin, you are automatically redirected to its edit page. You can then download and install optional files specific to the plugin. You are strongly advised to install firmware and language files for the phones you'll use although it's often not a strict requirement for the phones to work correctly.

Fig. 1.58: Configuration → Provisioning → Plugin

**Warning:** If you uninstall a plugin that is used by some of your devices, they will be left in an unconfigured state and won't be associated to another plugin automatically.

The search box at the top comes in handy when you want to find which plugin to install for your device. For example, if you have a Cisco SPA508G, enter “508” in the search box and you should see there's 1 plugin compatible with it.

**Note:** If your device has a number in its model name, you should use only the number as the search keyword since this is what usually gives the best results.

It's possible there will be more than 1 plugin compatible with a given device. In these cases, the difference between the two plugins is usually just the firmware version the plugins target. If you are unsure about which version you should install, you should look for more information on the vendor website.

It's good practice to only install the plugins you need and no more.

**Alternative plugins repository** By default, the list of plugins available for installation are the stable plugins for the officially supported devices.

This can be changed in the *Configuration → Provisioning → General* page, by setting the *URL* field to one of the following value:

- <http://provd.xivo.io/plugins/1/stable/> – *officially supported devices* “stable” repository (*default*)
- <http://provd.xivo.io/plugins/1/testing/> – officially supported devices “testing” repository
- <http://provd.xivo.io/plugins/1/archive/> – officially supported devices “archive” repository
- <http://provd.xivo.io/plugins/1/addons/stable/> – *community supported devices* “stable” repository

- <http://provd.xivo.io/plugins/1/addons/testing/> – community supported devices “testing” repository

The difference between the stable and testing repositories is that the latter might contain plugins that are not working properly or are still in developement.

The archive repository contains plugins that were once in the stable repository.

After setting a new URL, you must refresh the list of installable plugins by clicking the update icon of the *Configuration* → *Provisioning* → *Plugin* page.

## How to manually tell the phones to get their configuration

If you have set up a DHCP server on XiVO and the phones can access it, you can skip this section.

The according provisioning plugins must be installed.

**Aastra** On the web interface of your phone, go to *Advanced settings* → *Configuration server*, and enter the following settings:

Download Protocol

1. The first step is to identify the problem or question that needs to be addressed. This involves understanding the context and the specific requirements of the task.

2. Next, it is important to gather relevant information and data. This can be done through research, consultation with experts, or by analyzing existing resources.

3. Once the information is gathered, the next step is to develop a plan or strategy. This involves breaking down the problem into smaller, manageable parts and determining the best approach to solve each part.

4. After the plan is developed, the next step is to implement the solution. This involves putting the plan into action and monitoring the progress to ensure that the solution is effective.

5. Finally, it is important to evaluate the results of the solution. This involves comparing the actual outcomes with the expected results and identifying any areas for improvement.

HTTP Server

HTTP Path

HTTP Port

**Polycom** On the phone, go to *Menu* → *Settings* → *Advanced* → *Admin Settings* → *Network configuration* → *Server Menu* and enter the following settings:

- Server type: HTTP
- Server address: `http://<XiVO IP address>:8667/0000000000000.cfg`

Then save and reboot the phone.

**Snom** On the web interface of your phone, go to *Setup* → *Advanced* → *Update* and enter the following settings:

[Network](#) [Behavior](#) [Audio](#) [SIP/RTP](#) [QoS/Security](#) [Update](#)

**Update:**

Update Policy:  ?

Setting URL:  ?

Settings refresh timer:  ?

PnP Config: ☐ on ☒ off ?

**Yealink** On the web interface of your phone, go to *Settings* → *Auto Provision*, and enter the following settings:

- Server URL: `http://<XiVO IP address>:8667`

**Yealink** | T46G

[Status](#) [Account](#) [Network](#) [DSSKey](#) [Features](#) [Settings](#)

DHCP Active ☒ On ☐ Off ?

Custom Option(128~254)  ?

DHCP Option Value  ?

Server URL  ?

Save the changes by clicking on the *Confirm* button and then click on the *Autoprovision Now* button.

### Autoprovisioning a Device

Once you have installed the proper provd plugins for your devices and setup correctly your DHCP server, you can then connect your devices to your network.

But first, go to *Services* → *IPBX* → *Devices* page. You will then see that no devices are currently known by your XiVO:

**XiVO** [Services](#) [Configuration](#) [Preferences](#) [Help](#) [Contact](#)

Search

**IPBX**

**General settings**

- SIP Protocol
- IAX Protocol
- SCCP Protocol
- Dundi Protocol
- Voicemails
- Phonebook
- Advanced
- Outbound MWIs

**IPBX settings**

- Devices**
- Lines
- Users
- Groups
- Voicemails
- Conference rooms

**Call management**

- Incoming calls
- Outgoing calls
- Call permissions
- Call filters
- Call pickups
- Schedules

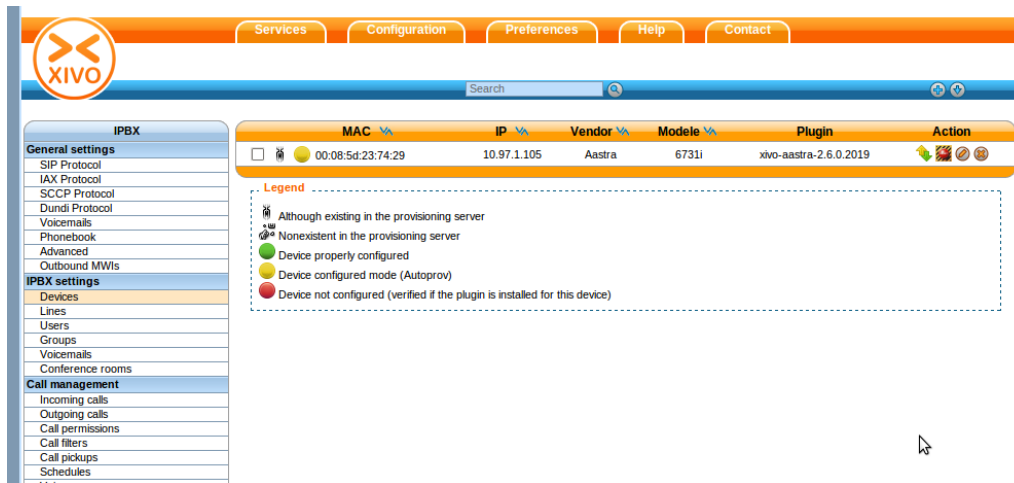

**Legend**

- Although existing in the provisioning server
- Nonexistent in the provisioning server
- Device properly configured
- Device configured mode (Autoprov)
- Device not configured (verified if the plugin is installed for this device)

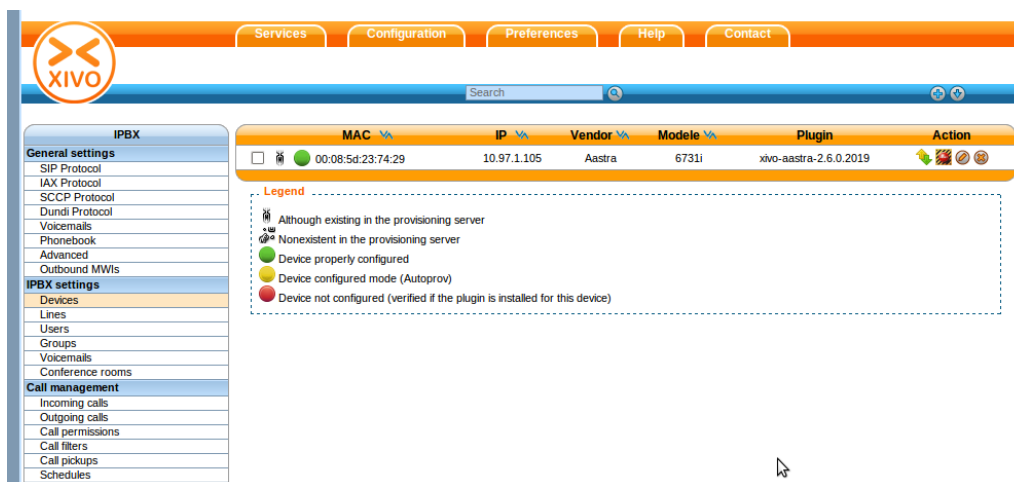

MAC	IP	Vendor	Model	Plugin	Action
No device found					

You can then power on your devices on your LAN. For example, after you power on an Aastra 6731i and give it

the time to boot and maybe upgrade its firmware, you should then see the phone having its first line configured as 'autoprov', and if you refresh the devices page, you should see that your XiVO now knows about your 6731i:

You can then dial from your Aastra 6731i the provisioning code associated to a line of one of your user. You will hear a prompt thanking you and your device should then reboot in the next few seconds. Once the device has rebooted, it will then be properly configured for your user to use it. And also, if you update the device page, you'll see that the icon next to your device has now passed to green:

## Resetting a Device

**From the Device List in the Webi** To remove a phone from XiVO or enable a device to be used for another user there are two different possibilities :

- click on the `reset to autoprov` button on the web interface

The phone will restarts and display autoprov, ready to be used for another user.

## From the User Form in the Webi

**Device With one User Only Associated** Edit the user associated to the device and put the device field to null.

- click on the `Save` button on the web interface

The phone doesn't restart and the phone is in autoprov mode in the device list.

You can synchronize the device to reboot it.

**Device with Several Users Associated** Edit the primary user associated to the terminal (one with the line 1) and put the device field to null.

- click on the *Save* button on the web interface

The primary line of the phone has been removed, so the device will lose its funckeys associated to primary user but there others lines associated to the device will stay provisionned.

The phone doesn't restart and the phone is in autoprov mode in the device list.

You can synchronize the device for reboot it.

### From a Device

- Dial **\*guest** (\*48378) on the phone dialpad followed by **xivo** (9486) as a password

The phone restarts and display autoprov, ready to be used for another user.

## Advanced Configuration

### DHCP Integration

If your phones are getting their network configuration from your XiVO's DHCP server, it's possible to activate the DHCP integration on the *Configuration* → *Provisioning* → *General* page.

What DHCP integration does is that, on every DHCP request made by one of your phones, the DHCP server sends information about the request to `provd`, which can then use this information to update its device database.

This feature is useful for phones which lack information in their TFTP/HTTP requests. For example, without DHCP integration, it's impossible to extract model information for phones from the Cisco 7900 series. Without the model information extracted, there's chance your device won't be automatically associated to the best plugin.

This feature can also be useful if your phones are not always getting the same IP addresses, for one reason or another. Again, this is useful only for some phones, like the Cisco 7900; it has no effect for Aastra 6700.

### Creating Custom Templates

Custom templates comes in handy when you have some really specific configuration to make on your telephony devices.

Templates are handled on a per plugin basis. It's not possible for a template to be shared by more than one plugin since it's a design limitation of the plugin system of `provd`.

**Note:** When you install a new plugin, templates are not migrated automatically, so you must manually copy them from the old plugin directory to the new one. This does not apply for a plugin upgrade.

---

Let's suppose we have installed the `xivo-aastra-3.3.1-SP2` plugin and want to write some custom templates for it.

First thing to do is to go into the directory where the plugin is installed:

```
cd /var/lib/xivo-provd/plugins/xivo-aastra-3.3.1-SP2
```

Once you are there, you can see there's quite a few files and directories:

```
tree
.
+-- common.py
+-- entry.py
+-- pkgs
|   +-- pkgs.db
+-- plugin-info
+-- README
+-- templates
|   +-- 6730i.tpl
|   +-- 6731i.tpl
|   +-- 6739i.tpl
|   +-- 6753i.tpl
|   +-- 6755i.tpl
|   +-- 6757i.tpl
|   +-- 9143i.tpl
|   +-- 9480i.tpl
|   +-- base.tpl
+-- var
    +-- cache
    +-- installed
    +-- templates
    +-- tftpboot
        +-- Aastra
            +-- aastra.cfg
```

The interesting directories are:

**templates** This is where the original templates lies. You *should not* edit these files directly but instead copy the one you want to modify in the `var/templates` directory.

**var/templates** This is the directory where you put and edit your custom templates.

**var/tftpboot** This is where the configuration files lies once they have been generated from the templates. You should look at them to confirm that your custom templates are giving you the result you are expecting.

**Warning:** When you uninstall a plugin, the plugin directory is removed altogether, including all the custom templates.

A few things to know before writing your first custom template:

- templates use the [Jinja2 template engine](#).
- when doing an `include` or an `extend` from a template, the file is first looked up in the `var/templates` directory and then in the `templates` directory.
- device in autoprov mode are affected by templates, because from the point of view of `provd`, there's no difference between a device in autoprov mode or fully configured. This means there's usually no need to modify static files in `var/tftpboot`. And this is a bad idea since a plugin upgrade will override these files.

**Custom template for every devices**

```
cp templates/base.tpl var/templates
vi var/templates/base.tpl
xivo-provd-cli -c 'devices.using_plugin("xivo-aastra-3.3.1-SP2").reconfigure()'
```

Once this is done, if you want to synchronize all the affected devices, use the following command:

```
xivo-provd-cli -c 'devices.using_plugin("xivo-aastra-3.3.1-SP2").synchronize()'
```

**Custom template for a specific model** Let's suppose we want to customize the template for our 6739i:

```
cp templates/6739i.tpl var/templates
vi var/templates/6739i.tpl
xivo-provd-cli -c 'devices.using_plugin("xivo-aastra-3.3.1-SP2").reconfigure()'
```

**Custom template for a specific device** To create a custom template for a specific device you have to create a device-specific template named `<device_specific_file_with_extension>.tpl` in the `var/templates/` directory :

- for an Aastra phone, if you want to customize the file `00085D2EECFB.cfg` you will have to create a template file named `00085D2EECFB.cfg.tpl`,
- for a Snom phone, if you want to customize the file `000413470411.xml` you will have to create a template file named `000413470411.xml.tpl`,
- for a Polycom phone, if you want to customize the file `0004f2211c8b-user.cfg` you will have to create a template file named `0004f2211c8b-user.cfg.tpl`,
- and so on.

Here, we want to customize the content of a device-specific file named `00085D2EECFB.cfg`, we need to create a template named `00085D2EECFB.cfg.tpl`:

```
cp templates/6739i.tpl var/templates/00085D2EECFB.cfg.tpl
vi var/templates/00085D2EECFB.cfg.tpl
xivo-provd-cli -c 'devices.using_mac("00085D2EECFB").reconfigure()'
```

**Note:** The choice to use this syntax comes from the fact that `provd` supports devices that do not have MAC addresses, namely softphones.

Also, some devices have more than one file (like Snom), so this way make it possible to customize more than 1 file.

The template to use as the base for a device specific template will vary depending on the need. Typically, the model template will be a good choice, but it might not always be the case.

**Changing the Plugin Used by a Device**

From time to time, new firmwares are released by the devices manufacturer. This sometimes translate to a new plugin being available for these devices.

When this happens, it almost always means the new plugin obsoletes the older one. The older plugin is then considered “end-of-life”, and won’t receive any new updates nor be available for new installation.

Let’s suppose we have the old `xivo-aastra-3.2.2.1136` plugin installed on our xivo and want to use the newer `xivo-aastra-3.3.1-SP2` plugin.

Both these plugins can be installed at the same time, and you can manually change the plugin used by a phone by editing it via the *Services* → *IPBX* → *Devices* page.

If you are using custom templates in your old plugin, you should copy them to the new plugin and make sure that they are still compatible.

Once you take the decision to migrate all your phones to the new plugin, you can use the following command:

```
xivo-provd-cli -c 'helpers.mass_update_devices_plugin("xivo-aastra-3.2.2.1136", "xivo-aastra-3.3.1")'
```

Or, if you also want to synchronize (i.e. reboot) them at the same time:

```
xivo-provd-cli -c 'helpers.mass_update_devices_plugin("xivo-aastra-3.2.2.1136", "xivo-aastra-3.3.1", true)'
```

You can check that all went well by looking at the *Services* → *IPBX* → *Devices* page.

### NAT

The provisioning server has partial support for environment where the telephony devices are behind a NAT equipment.

By default, each time the provisioning server receives an HTTP/TFTP request from a device, it makes sure that only one device has the source IP address of the request. This is not a desirable behaviour when the provisioning server is used in a NAT environment, since in this case, it's normal that more than 1 devices have the same source IP address (from the point of view of the server).

If *all* your devices used on your XiVO are behind a NAT, you should disable this behaviour by setting the NAT option to 1 via the *Configuration* → *Provisioning* → *General* page.

Enabling the NAT option will also improve the performance of the provisioning server in this scenario.

### Limitations

- You must only have phones of the following brands:
  - Aastra
  - Cisco SPA
  - Yealink
- All your devices must be behind a NAT equipment (the devices may be grouped behind different NAT equipments, not necessarily the same one)
- You must provision the devices via the Web interface, i.e. associate the devices from the user form. Using the 6-digit provisioning code on the phone will produce unexpected results (i.e. the wrong device will be provisioned)

For technical information about why other devices are not supported, you can look at [this issue](#) on the XiVO bug tracker.

### Remote directory

If you have a phone provisioned with XiVO and its one of the supported ones, you'll be able to search in your XiVO directory and place call directly from your phone.

See the list of *supported devices* to know if a model supports the XiVO directory or not.

### Configuration

For the remote directory to work on your phones, the first thing to do is to go to the *Services* → *IPBX* → (*General settings*) *Phonebook* page.

You then have to add the range of IP addresses that will be allowed to access the directory. So if you know that your phone's IP addresses are all in the 192.168.1.0/24 subnet, just click on the small "+" icon and enter "192.168.1.0/24", then save.

Once this is done, on your phone, just click on the “remote directory” function key and you’ll be able to do a search in the XiVO directory from it.

## Jitsi

Jitsi (<http://jitsi.org/>) is an opensource softphone (previously SIP Communicator).

XiVO now support Jitsi sofphones provisioning. Here are the steps to follow :

### Requirements

This how to needs :

1. Jitsi installed,
2. SIP line created

### Add Jitsi plugin on XiVO

Open XiVO Web interface, and go to Configuration tab, Then chose *Provisioning* → *Plugins menu*, Install the Jitsi plugin you want to use : e.g.:

```
xivo-jitsi-1
```

You can now launch your Jitsi softphone

### Configuring Jitsi

1. Launch Jitsi,
2. If you don’t have any accounts configured Jitsi will launch a windows and you can click
3. Use online provisioning. Otherwise go to Tools -> Options -> Advanced -> Provisioing, Click on Enable provisioning
4. Select Manually specify a provisioning URI,
5. Enter the folowing URI where <provd\_ip> is the VoIP interface IP address of your XiVO and <provd\_port> is the provd port (default : 8667)

```
http://<provd_ip>:<provd_port>/jitsi?uuid=${uuid}
```

6. When done, quit Jitsi,
7. Launch Jitsi again,
  - You should now be connected with in autoprov mode,
  - You could see a new device in the devices list,
8. You can now provision the phones by typing the provisioning code (you get it in the Lines list),
9. Quit Jitsi again (configuration syncing is not available with the Jitsi plugin)
10. And launch Jitsi again : you should now be connected with you phone account

## 1.8.28 SCCP Configuration

**Activating DHCP Server:** *Configuration* → *Network* → *DHCP*

**Activating DHCP Integration:** *Configuration* → *Provisioning* → *General*

**Installing a plugin for SCCP Phone:** *Configuration* → *Provisioning* → *Plugins*

Fig. 1.59: Installing xivo cisco-sccp plugin

**Review SCCP general settings:** *Services* → *IPBX* → *IPBX settings* → *SCCP general settings*

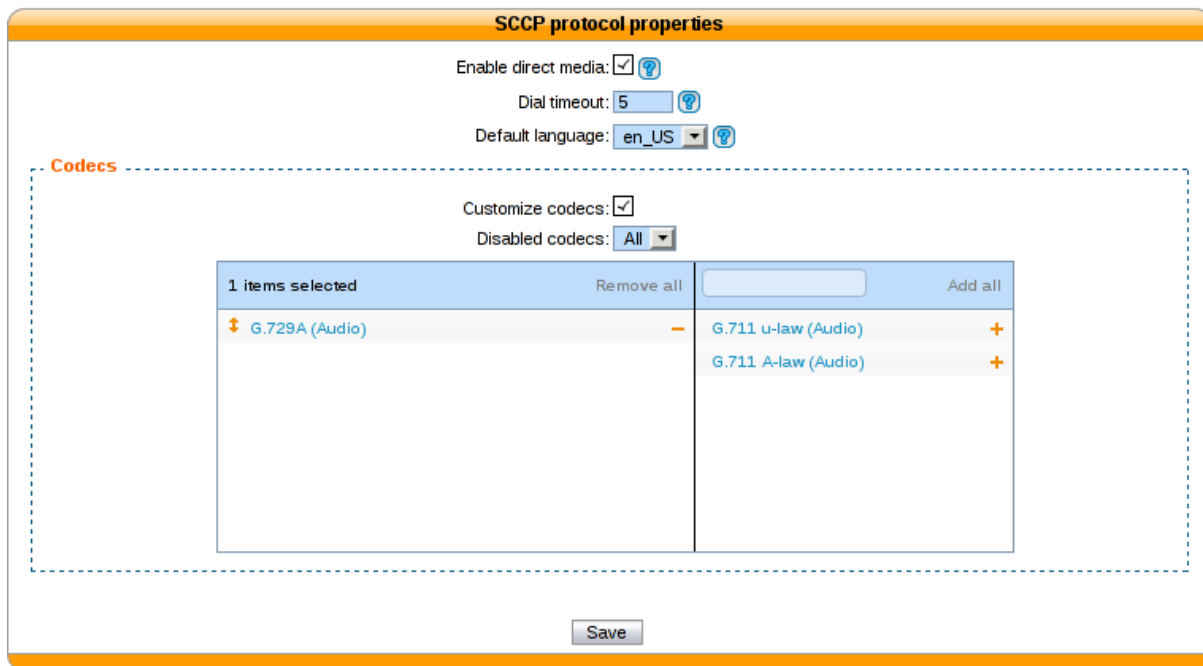

Fig. 1.60: SCCP general settings

At this point you should have a fully functional DHCP server that provides IP address to your phones. Depending on what type of CISCO phone you have, you need to install the plugin sccp-legacy, sccp-9.0.3 or both.

**Note:** Please refer to the [Provisioning page](#) for more information on how to install CISCO firmwares.

Once your plugin is installed, you'll be able to edit which firmwares and locales you need. If you are unsure, you can choose all without any problem.

Now if you connect your first SCCP phone, you should be able to see it in the device list.

**Listing the detected devices:** *Services* → *IPBX* → *IPBX settings* → *Devices*

When connecting a second SCCP phone, the device will be automatically detected as well.

The last step is to create a user with a SCCP line.

**Creating a user with a SCCP line:** *Services* → *IPBX* → *IPBX settings* → *Users*

Before saving the newly configured user, you need to select the *Lines* menu and add a SCCP line. Now, you can save your new user.

Congratulations ! Your SCCP phone is now ready to be called !

Type of Service (TOS)	Manual

## Telephone

Device type	Supported	Firmware version	Timezone aware
7905	Should work		
7906	Yes	SCCP11.9-0-3S	Yes
7911	Yes	SCCP11.9-0-3S	Yes
7912	Yes	8.0.4(080108A)	No
7920	Yes	3.0.2	No
7921	Yes	1.4.5.3	Yes
7940	Yes	8.1(2.0)	No
7941	Yes	SCCP41.9-0-3S	Yes
7941GE	Yes	SCCP41.9-0-3S	Yes
7942	Yes	SCCP42.9-0-3S	Yes
7960	Yes	8.1(2.0)	No
7961	Yes	SCCP41.9-0-3S	Yes
7962	Yes	SCCP42.9-0-3S	Yes
CIPC	Yes	2.1.2	Yes

An unsupported device won't be able to connect to asterisk at all.

The "Timezone aware" column indicates if the device supports the timezone tag in its configuration file, i.e. in the file that the device request to the provisioning server when it boots. If you have devices that don't support the timezone tag and these devices are in a different timezone than the one of the XiVO, you can look at [the issue #5161](#) for a potential solution.

### 1.8.29 Schedules

Schedules are specific time frames that can be defined to open or close a service. Within schedules you may specify opening days and hours or close days and hours.

A default destination as user, group ... can be defined when the schedule is in closed state.

Schedules can be applied to :

- Users
- Groups
- Inbound calls
- Outbound calls
- Queues

### Creating Schedules

A schedule is composed of a name, a timezone, one or more opening hours or days that you may setup using a calendar widget, a destination to be used when the schedule state is closed.

With the calendar widget you may select months, days of month, days of week and opening time.

You may also optionally select closed hours and destination to be applied when period is inside the main schedule. For example, your main schedule is opened between 08h00 and 18h00, but you are closed between 12h00 and 14h00.

### Using Schedule on Users

When you have a schedule associated to a user, if this user is called during a closed period, the caller will first hear a prompt saying the call is being transferred before being actually redirected to the closed action of the schedule.

If you don't want this prompt to be played, you can change the behaviour by:

**Schedules > Add**

General Closed hours

Name:

Timezone:

**Opened hours**

Schedule	
09h00 to 18h00, Mon to Fri, ...	 

**Out of schedule / Default action**

1. editing the `/etc/xivo/asterisk/xivo_globals.conf` file and setting the `XIVO_FWD_SCHEDULE_OUT_ISDA` to 1
2. reloading the asterisk dialplan with an asterisk `-rx "dialplan reload"`.

### 1.8.30 Sound Files

#### Add Sounds Files

On a fresh install, only `en_US` and `fr_Fr` sounds are installed. Canadian French and German are available too.

To install Canadian French sounds you have to execute the following command in the cli:

```
root@xivo:~# apt-get install asterisk-sounds-wav-fr-ca xivo-sounds-fr-ca
```

To install German sounds you have to execute the following command in the cli:

```
root@xivo:~# apt-get install asterisk-sounds-wav-de-de xivo-sounds-de-de
```

Now you may select the newly installed language for yours users.

#### Convert Your Wav File

Asterisk will read natively WAV files encoded in wav 8kHz, 16 bits, mono.

The following command will return the encoding format of the `<file>`

```
$ file <file>
RIFF (little-endian) data, WAVE audio, Microsoft PCM, 16 bit, mono 8000 Hz
```

The following command will re-encode the `<input file>` with the correct parameters for asterisk and write into the `<output file>`

```
$ sox <input file> -b 16 -c 1 -r 8000 -t wavpcm <output file>
```

## 1.8.31 Switchboard

This page describes the configuration needed to have a switchboard on your XiVO.

### Overview

Switchboard functionality is available in the XiVO client. The goal of this page is to explain how to configure your switchboard and how to use it.

The switchboard xlet and profile allow an operator to view incoming calls, answer them, put calls on hold, view the calls on hold and pick up the calls on hold.

### Limitations

---

**Note:** The shortcut keys of the switchboard do not work on the Mac version of the XiVO client.

---

---

**Note:** The enter shortcut to answer a call will not work if the focus is currently on a widget that will consume the key press. ie: a text field, a drop down

---

---

**Note:** The call center statistics are not applicable to the switchboard queues. The only valid counter is the ‘received’ calls counter.

---

## Configuration

### Quick Summary

In order to configure a switchboard on your XiVO, you need to:

- Create a queue for your switchboard
- Create a queue for your switchboard’s calls on hold
- Create the users that will be operators
- Activate the switchboard option for your phone
- Create an agent for your user
- Assign the incoming calls to the switchboard queue
- For each operator, add a function key for logging in or logging out from the switchboard queue.
- Set “no answer” destinations on the switchboard queue

### Supported Devices

The supported phones for the switchboard are:

Brand	Model	XiVO version	Plugin version
Aastra	6755i	>= 14.07	>= xivo-aastra-3.3.1-SP2, v1.0
Aastra	6757i	>= 14.07	>= xivo-aastra-3.3.1-SP2, v1.0
Aastra	6735i	>= 14.07	>= xivo-aastra-3.3.1-SP2, v1.2
Aastra	6737i	>= 14.07	>= xivo-aastra-3.3.1-SP2, v1.2
Polycom	VVX 400	>= 15.11	>= xivo-polycom-5.3.0, v1.3
Polycom	VVX 410	>= 15.11	>= xivo-polycom-5.3.0, v1.3
Snom	720	>= 14.14	>= xivo-snom-8.7.3.25.5, v1.0
Snom	D725	>= 14.14	>= xivo-snom-8.7.5.17, v1.4
Yealink	T46G	>= 15.01	>= xivo-yealink-72.0, v1.22.1

### Create a Queue for Your Switchboard

All calls to the switchboard will first be distributed to a switchboard queue.

To create this queue, go to *Services* → *Call center* → *Queues* and click the add button.

The screenshot shows the 'Queues > Edit \_\_switchboard (9@pcm-dev)' configuration page. The 'General' tab is selected, and the following fields are visible:

- Name:
- Display name:
- Number:
- Ring strategy:  (with a help icon)
- Context:
- On-Hold Music:  (with a help icon)
- Add an announce:
- Customize the name of the caller:
- Preprocess subroutine:

A 'Save' button is located at the bottom of the form.

The following configuration is mandatory

- The *General* → *Name* field has to be `__switchboard`
- The *General* → *Ring strategy* field has to be *Ring all*
- The *General* → *Preprocess subroutine* field has to be `xivo_subr_switchboard`
- The *Application* → *Allow caller to hang up call* option has to be *enabled*
- The *Application* → *Allow callee to transfer the call* option has to be *enabled*
- The *Advanced* → *Member reachability timeout* option has to be *disabled*
- The *Advanced* → *Time before retrying a call to a member* option has to be *1 second*
- The *Advanced* → *Delay before reassigning a call* option has to be *disabled*
- The *Advanced* → *Call a member already on* option has to be *disabled*
- The *Advanced* → *Autopause agents* option has to be *No*

Other important fields

- The *General* → *Display name* field is the name displayed in the XiVO client xlets and in the statistics
- The *General* → *Number* field is the number that will be used to reach the switchboard internally (typically 9)

### Create a Queue for Your Switchboard on Hold

The switchboard uses a queue to track its calls on hold.

To create this queue, go to *Services* → *Call center* → *Queues* and click the add button.

The following configuration is mandatory

- The *General* → *Name* field has to be `__switchboard_hold`
- The *General* → *Number* field has to be a valid number in a context reachable by the switchboard

Other important fields

- The *General* → *Display name* field is the name displayed in the XiVO client xlets and in the statistics

<b>Warning:</b> This queue MUST have <b>NO</b> members
--

### Create the Users that Will be Operators

Each operator needs to have a user configured with a line. The XiVO client profile has to be set to *Switchboard*.

The following configuration is mandatory for switchboard users

- The *General* → *First name* field has to be set
- The *General* → *Enable XiVO Client* option has to be *enabled*
- The *General* → *Login* field has to be set
- The *General* → *Password* field has to be set
- The *General* → *Profile* field has to be set to *Switchboard*
- The *Lines* → *Number* field has to have a valid extension
- The *Lines* → *Device* field has to be a *supported device*
- The *Services* → *Enable call transfer* option has to be *enabled*

### Activate the Switchboard Option for your Phone

The switchboard option must be activated on the phone. It's possible to activate this option only on *supported phones* and plugins.

- Edit device associated to your user in *Services* → *Devices*
- Check the switchboard checkbox and save
- Synchronize your phone to apply the changes

**Polycom Phones** To be able to use a Polycom phone for the switchboard, the XiVO must be able to do HTTP requests to the phone. This might be problematic if there's a NAT between your XiVO and your phone.

It's possible to configure the Polycom switchboard via the *configuration files* of xivo-ctid. The following options are available:

```
switchboard_polycom:
  username: xivo_switchboard
  password: xivo_switchboard
  answer_delay: 0.5
```

You will also need to change the XML API username/password by creating a *custom template* for your phone.

**Users > Add**

General Lines No answer Services Voicemail Groups Func Keys

User field:

**XiVO Client**

Enable XiVO Client: ☒

Login:

Password:

Profile:

Description:

IP:

MAC:

Plugin:

Device config template:

Switchboard: ☒

**Snom Phones** When using a Snom switchboard, you must not configure a function key on position 1.

To be able to use a Snom phone for the switchboard, the XiVO must be able to do HTTP requests to the phone. This might be problematic if there's a NAT between your XiVO and your phone. The following command should work from your XiVO's bash command line `wget http://guest:guest@<phone IP address>/command.htm?key=SPEAKER`. If this command does not activate the phone's speaker, your network configuration will have to be *fixed* before you can use the Snom switchboard.

It's possible to configure the Snom switchboard via the *configuration files* of xivo-ctid. The following options are available:

```
switchboard_snom:
  username: guest
  password: guest
  answer_delay: 0.5
```

You have to change the username and password option if you have changed the administrator username or administrator password for your phone in *Configuration* → *Provisioning* → *Template Device*.

### Create an Agent for the Operator

Each operator needs to have an associated agent.

**Warning:** Each agent MUST ONLY be a member of the Switchboard queue

To create an agent:

- Go to *Services* → *Call center* → *Agents*
- Click on the group *default*
- Click on the *Add* button

The screenshot shows a web interface for adding a new agent. The title bar says 'Agents > Add an agent'. There are four tabs: 'General', 'Users', 'Queues', and 'Advanced'. The 'General' tab is active. The form contains the following fields: 'First name' with the value 'Bob', 'Last name' (empty), 'Number' with the value '1674', 'Password' (empty), 'Context' with a dropdown menu showing 'Default (default)', 'Language' with a dropdown menu (empty), and 'Group' with a dropdown menu showing 'default'. A 'Save' button is located at the bottom of the form.

- Associate the user to the agent in the *Users* tab
- Assign the Agent to the *Switchboard* Queue (**and ONLY to the Switchboard queue**)

### Send Incoming Calls to the *Switchboard* Queue

Incoming calls must be sent to the *Switchboard* queue to be distributed to the operators. To do this, we have to change the destination of our incoming call for the switchboard queue.

In this example, we associate our incoming call (DID 444) to our *Switchboard* queue:

**Agents > Add an agent**

General **Users** Queues Advanced

1 items selected	Remove all		Add all
Bob	—	Abraham Maharba	+
		Alice Wonderland	+
		Charlie Chaplin	+
		Voice Mail	+

Save

**Agents > Add an agent**

General **Users** **Queues** Advanced

Search

boulangerie	<input type="button" value="→"/> <input type="button" value="←"/>	__switchboard
bro		
epicerie		
green		
queue_early_rtp		

Name	Penalty
__switchboard	0

Save

**Incoming calls > Add**

General **Call permissions** Schedules

DID: 444

Context: Incalls (from-extern)

Destination: Queue

Redirect to: \_\_switchboard (9@default)

Ring time:

CallerID mode:

Preprocess subroutine:

Description:

Save

### Set “No Answer” Destinations on the *Switchboard* Queue

When there are no operators available to answer a call, “No Answer” destinations should be used to redirect calls towards another destination.

You also need to set the timeout of the Switchboard queue to know when calls will be redirected.

Queues > Edit \_\_switchboard (9@default)

General Announces Members Application No answer Advanced Schedules Diversions

Ringing time: 30 seconds

Timeout priority: Configuration

Data quality: ☐

Allow callee to hang up the call: ☐

Allow caller to hang up the call: ☒

No retry when time has elapsed: ☐

Ring instead of On-Hold Music: ☐

The reachability timeout must not be disabled nor be too short.

The time before retrying a call to a member should be as low as possible (1 second).

Queues > Edit \_\_switchboard (9@default)

General Announces Members Application No answer Advanced Schedules Diversions

Exit context:

Service level: 0

Member reachability timeout: 30 seconds

Time before retrying a call to a member: 1 second

Weight: 0

Delay before reassigning a call: Disabled

Maximum number of people allowed to wait: 0

In this example we redirect “No Answer”, “Busy” and “Congestion” calls to the *everyone* group and “Fail” calls to the *guardian* user.

You can also choose to redirect all the calls to another user or a voice mail.

## XiVO Client configuration

### Directory xlet

The transfer destination is chosen in the Directory xlet. You **must** follow the *Directory* section to be able to use it.

### Configuration for multiple switchboards

The above documentation can be used for multiple switchboards on the same XiVO by replacing the `__switchboard` and `__switchboard_hold` queues name and configuring the operators XiVO client accordingly in the *XiVO Client* → *Configure* → *Functions* → *Switchboard* window.

**Queues > Edit** \_\_switchboard (9@default)

☒ Presence reporting

☐ Customer Info

Presence reporting | Customer Info | Dialer | Switchboard |

Switchboard queue name

Switchboard call on hold queue name

## Usage

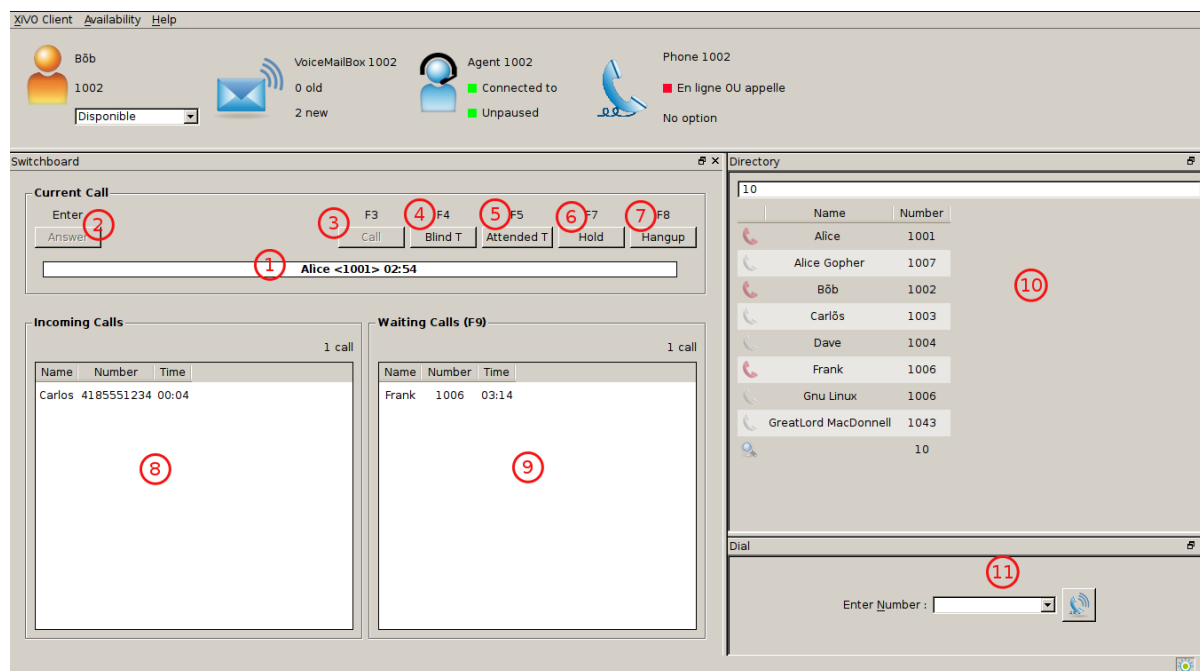

**Warning:** The switchboard configuration must be completed before using the switchboard. This includes :

- Device, User, Agent and Queues configuration (see above),
- Directory xlet configuration (see [Directory](#))

If it's not the case, the user must disconnect his XiVO client and reconnect.

## The XiVO Client Switchboard Profile

When the user connects with his XiVO Client, he gets the Switchboard profile.

1. *Current Call* frame
2. *Answer* button
3. *Call* button
4. *Blind transfer* button
5. *Attended transfer* button
6. *Hold* button
7. *Hangup* button
8. *Incoming Calls* list
9. *Waiting Calls* list
10. *Directory* Xlet
11. *Dial* Xlet

**Note:** If you don't see the Switchboard Xlet, right-click on the grey bar at the right of the *Help* menu and check *Switchboard*:

The operator can login his agent using a function key or an extension to start receiving calls.

### Call flow

**Answering an incoming call** When the switchboard receives a call, the new call is added to the *Incoming Calls* list on the left and the phone starts ringing. The user can answer this call by:

- clicking on any call in the list
- clicking the *Answer* button
- pressing the *Enter* key

---

**Note:** The XiVO Client must be the active window for the keyboard shortcuts to be handled

---

The operator can select which call to answer by:

- clicking directly on the incoming call
- pressing *F6* to select the incoming calls frame and pressing the up and down arrow keys

Selecting a call to answer while talking will not answer the call.

Once the call has been answered, it is removed from the incoming calls list and displayed in the *Current Call* frame.

**Making a Call** The switchboard operator can do the following operations:

- Press the *Call* button or press *F3*
- Search for the call destination in the directory xlet
- Press to confirm the selection and start the call

**Hanging Up a Call** The switchboard operator can hang up its current call by either:

- Clicking the *Hangup* button
- Pressing the *F8* key

If the operator has placed a new call via the *Directory* or *Dial* xlet and that call has not yet been answered, he can cancel it in the same way.

**Distributing a call** Once the call has been answered and placed in the current call frame, the operator has 3 choices:

- transfer the call to another user
  - using the *Blind transfer* button or the *F4* key.
  - using the *Attended transfer* button or the *F5* key
- put the call on hold using the *Hold* button or the *F7* key
- end the call using the *Hangup* button or the *F8* key.

**Transferring a call** Transfer buttons allow the operator to select towards which destination he wishes to transfer the call. This is made through the *Directory* xlet. For details about the xlet *Directory* usage and configuration see [Directory](#).

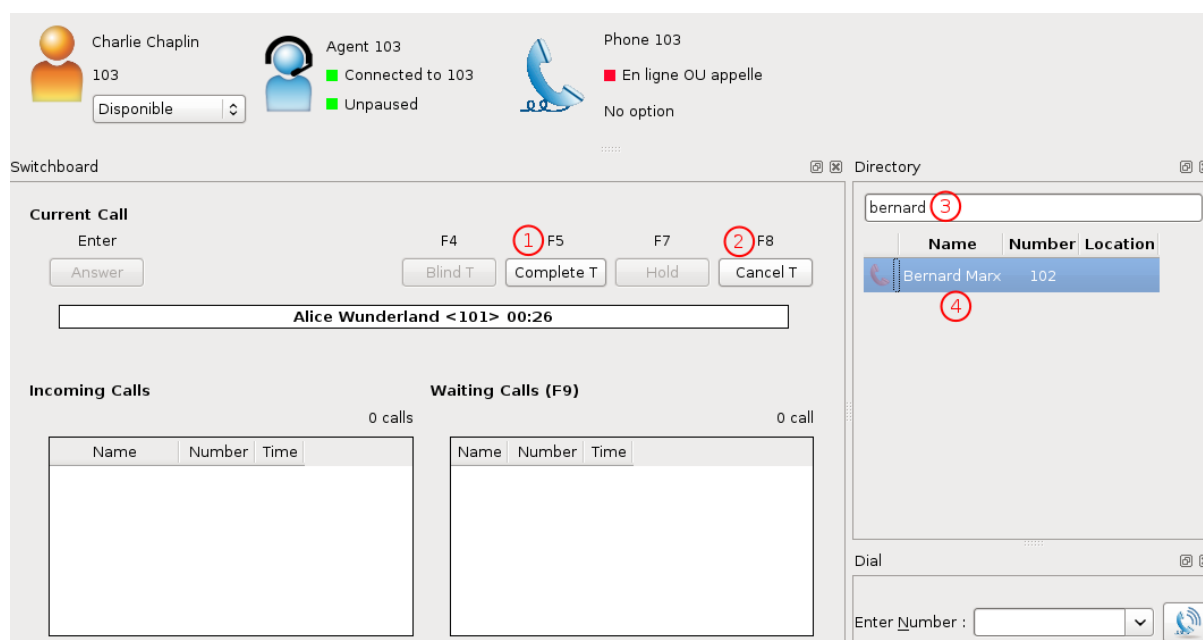

Once the destination name has been entered, press *Enter*. If multiple destinations are displayed, you can choose by:

- double-clicking on the destination
- using *Up/Down* arrows then:
  - pressing *Enter*
  - pressing the transfer button again

Blind transfers are straightforward: once the call is transferred, the operator is free to manage other calls.

Attended transfers are a bit more complicated: the operator needs to wait for the transfer destination to answer before completing the transfer.

In this example, the operator is currently asking *Bernard Marx* if he can transfer *Alice Wonderland* to him.

1. *Complete transfer* button
2. *Cancel transfer* button
3. Transfer destination filtering field (xlet *Directory*)
4. Transfer destination list (xlet *Directory*)

Once the destination has answered, you can:

- cancel the transfer with *F8* key
- complete the transfer with *F5* key

**Note:** The operator can not complete an attended transfer while the transfer destination is ringing. In this case, the operator must cancel the attended transfer and use the *Blind transfer* action.

**Putting a call on hold** If the user places the call on hold, it will be removed from the *Current call* frame and displayed in the *Waiting calls* list. The time counter shows how long the call has been waiting, thus it will be reset each time the call returns in the *Waiting calls* list. The calls are ordered from the oldest to the newest.

**Retrieving a call on hold** Once a call has been placed on hold, the operator will most certainly want to retrieve that call later to distribute it to another destination.

To retrieve a call on hold:

- click the desired call in the *Waiting calls* list
- with the keyboard:
  - move the focus to the *Waiting calls* list (*F9* key)
  - choose the desired call with the arrow keys
  - press the *Enter* key.

Once a call has been retrieved from the *Waiting calls* list, it is moved back into the *Current Call* frame, ready to be distributed.

## 1.8.32 Users

Users Configuration.

### Importing Users

You may import your users using a csv comma separated file. Users and lines are automatically created.

#### How to import users

Once you have saved your file, you can import your users via the *Services* → *IPBX* → *IPBX settings* → *Users* page by clicking on the plus button.

Fig. 1.70: Import Users

#### Supported fields

Field	Values	Description
<b>[section user] To add a user</b>		
entityid	int	entity id (configuration menu) Must be a val
firstname *	string	User firstname
lastname	string	User lastname
language **	enum [ <i>'de_DE'</i> , <i>'en_US'</i> , <i>'es_ES'</i> , <i>'fr_FR'</i> , <i>'fr_CA'</i> ]	Locale Must be set if you add a voi
enableclient	bool [ <i>0</i> , <i>1</i> ]	If set to 1, username and password fields have to b
username	string	XiVO Client username
password	string	XiVO Client password
profileclient	string	XiVO Client profile defined in menu: <i>Services</i> >
outcallerid	string	Customize outgoing caller id for this user

Table 1.7 – continued from previous page

Field	Values	Description
agentnumber	string	Associated agent number
mobilephonenumber	string	Mobile phone number
bosssecretary	enum [ <i>'no'</i> , <i>'boss'</i> , <i>'secretary'</i> ]	Filter: Boss - Secretary
enablehint	bool [ <i>0</i> , <i>1</i> ]	Enable/Disable supervision
enablexfer	bool [ <i>0</i> , <i>1</i> ]	Enable/Disable call transfers
<b>[section line]</b>	<b>To add a line to an user</b>	
phonenumber *	string	User phone number creates a line Must exist
context *	string	context name internal context must exist
protocol *	enum [ <i>'sip'</i> , <i>'sccp'</i> ]	Line protocol
linename	string	Line name (SIP only)
linesecret	string	Line secret (SIP only)
<b>[section incall]</b>	<b>To add an incall to an user</b>	
incallexten *	string	DID number incallexten must exist in
incallcontext *	string	Context name incall context must exist
incallingseconds	int	Ring time in seconds
<b>[section voicemail]</b>	<b>To add a voicemail to a user</b>	You must set a language to use this section
voicemailname *	string	Voicemail fullname
voicemailmailbox *	string	Mailbox number
voicemailpassword	string	Password voicemail
voicemailemail	string	Mail to send a notification when a message is received
voicemailattach	bool [ <i>0</i> , <i>1</i> ]	Enable/Disable attach the audio file to your mail
voicemaildelete	bool [ <i>0</i> , <i>1</i> ]	Enable/Disable delete message after notification
voicemailskippass	bool [ <i>0</i> , <i>1</i> ]	Enable/Disable password checking

**Warning:** “\*”, this field is required - valid by section

**Warning:** “\*\*\*”, this field is required if you add a voicemail

## Examples

First step is to create a text file containing the users you want to create. Here’s a basic example:

```
entityid|firstname|lastname|phonenumber|context|protocol|mobilephonenumber
1|John|Doe|1000|default|sip|00123456789
1|George|Clinton|1001|default|sip|00123456789
1|Bill|Bush|1002|default|sip|00123456789
```

This example defines 3 users:

- John Doe with one SIP line with number 1000
- George Clinton with one SIP line with number 1001
- Bill Bush with one SIP line with number 1002

**Note:** Note that the number you use must all be in the range you defined for your default context.

Text file to add a simple user with a line and voicemail:

```
entityid|firstname|lastname|language|phonenumber|context|protocol|voicemailname|voicemailmailbox|
1|John|Doe|en_US|1000|default|sip|John Doe|1000|1234
```

Text file to add a simple user with a line and incall:

```
entityid|firstname|lastname|phonenumber|context|protocol|incallexten|incallcontext
1|John|Doe|1000|default|sip|2050|from-extern
```

## Function keys

Function keys can be configured to customize the user's phone keys. Key types are pre-defined and can be browsed through the Type drop-down list. The Supervision field allows the key to be supervised. A supervised key will light up when enabled. In most cases, a user cannot add multiple times exactly the same function key (example : two user function keys pointing to the same user). Adding the same function key multiple times can lead to undefined behavior and generally will delete one of the two function keys.

**Warning:** SCCP device only supports type “Customized”.

Key	Type	Destination	Label	Supervision
1	Do not disturb			Enabled
2	Incoming call filtering			Enabled
3	Enable / Disable forwarding uncond	102		Enabled
4	Enable / Disable forwarding on b	102		Enabled
5	Enable / Disable forwarding on r	102		Enabled
6	Enable / Disable forwarding uncond	103		Enabled

Save

For User keys, start to key in the user name in destination, XiVO will try to complete with the corresponding user.

If the forward unconditionnal function key is used with no destination the user will be prompted when the user presses the function key and the BLF will monitor *ALL* unconditionnal forward for this user.

## Extensions

### \*3 (online call recording)

To enable online call recording, you must check the “Enable online call recording” box in the user form.

When this option is activated, the user can press \*3 during a conversation to start/stop online call recording. The recorded file will be available in the `monitor` directory of the *Services* → *IPBX* → *Audio files* menu.

### \*26 (call recording)

You can enable/disable the recording of all calls for a user in 2 different way:

1. By checking the “Call recording” box of the user form.
2. By using the extension \*26 from your phone (the “call recording” option must be activated in *Services* → *IPBX* → *Extensions*).

When this option is activated, all calls made to or made by the user will be recorded in the `monitor` directory of the *Services* → *IPBX* → *Audio files* menu.

### 1.8.33 Voicemail

Voicemail Configuration.

#### General Configuration

You can configure general settings for your voicemail service in *Services* → *IPBX* → *General Settings* → *Voicemails* page.

#### Adding voicemail

There are 2 ways to add a voicemail. First is with *Services* → *IPBX* → *IPBX settings* → *Voicemails* page, 2nd is editing user's configuration.

##### 1 - Via *Services* → *IPBX* → *IPBX settings* → *Voicemails*

In here you can add some voicemails and configure them by clicking on the plus button.

Fig. 1.73: Add voicemail from voicemails menu

Once your voicemails are configured, you have to edit the users configuration to search the voicemails previously created and then associate them to your users.

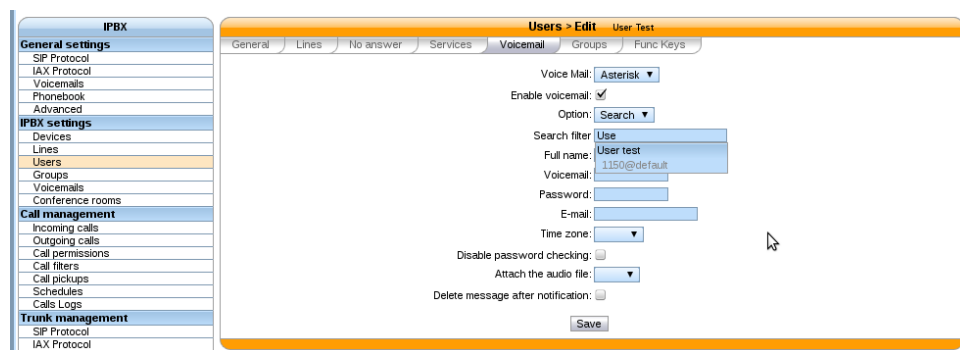

Fig. 1.74: Search voicemail for specific user

##### 2 - On user's configuration

The other way is to directly add the voicemail from user's configuration in the 'voicemail' tab :

**Warning:** In this way, the language has to be set in user's general configuration

#### Deactivating voicemail

You can deactivate user's voicemail by un-checking 'Enable voicemail' option on the Voicemail tab from user's configuration:

Fig. 1.75: Add voicemail from user configuration

Fig. 1.76: Deactivate user's voicemail

## Disassociating voicemail

You can disassociate a voicemail from a user by selecting the 'None' option on 'Voice Mail' select box, from user's configuration:

Fig. 1.77: Disassociate voicemail

**Warning:** Note that disassociating a voicemail from its user doesn't delete that voicemail.

## Deleting voicemail

Delete voicemail is done on *Services* → *IBX* → *IPBX settings* → *Voicemails*

### Warning:

- Deleting a voicemail is irreversible. It deletes all messages associated with that voicemail.
- If concerned user still have messages waiting for him, you have to manually reboot the phone.

## Disable password checking

This option allows to skip password checking for the voicemail when it is consulted from the inside. More precisely, password checking will be skipped:

- when calling the voicemail with \*98
- when calling the voicemail with \*99<voicemail number>

But it will not be skipped when the voicemail is consulted through an incoming call. For instance, let's consider the following incoming call:

The screenshot shows a configuration window for an incoming call with DID 53123. The 'Context' is set to 'Incalls (from-extern)'. The 'Application' is set to 'Voicemail consulting'. The 'Context' dropdown below 'Application' is set to 'default' and is highlighted with a red circle. Other fields include 'Destination: Application', 'CallerID mode', 'Preprocess subroutine', and a 'Description' text area. A 'Save' button is at the bottom.

With such a configuration, when calling this incoming call from the outside, we will be asked for:

- the voicemail number we want to consult
- the voicemail password, **even if the “Disable password checking option” is activated**

And then, we will be granted access to the voicemail.

Take note that the second “context” field contains the context of the voicemail. Voicemails of other contexts will not be accessible through this incoming call.

## 1.9 Contact Center

In XiVO, the contact center is implemented to fulfill the following objectives :

- Call routing
  - Includes basic call distribution using call queues and skills-based routing
- Agent and Supervisor workstation.
  - Provides the ability to execute contact center actions such as: agent login, agent logout and to receive real time statistics regarding contact center status
- Statistics reporting
  - Provides contact center management reporting on contact center activities
- Advanced functionalities
  - Call recording
- Screen Pop-up

## 1.9.1 Agents

### Introduction

*A call center agent is the person who handles incoming or outgoing customer calls for a business. A call center agent might handle account inquiries, customer complaints or support issues. Other names for a call center agent include customer service representative (CSR), telephone sales or service representative (TSR), attendant, associate, operator, account executive or team member.*

—SearchCRM

In this respect, agents in XiVO have no fixed line and can login from any registered device.

### Getting Started

- Create a user with a SIP line and a provisioned device.
- Create agents.
- Create a queue adding created agent as member of queue.

### Creating agents

#### Service > Call center > Agents > General

These settings are specific for a given agent.

#### Service > Call center > Agents > Users

These settings are specific for a given agent.

#### Service > Call center > Agents > Queues

These settings are specific for a given agent.

#### Service > Call center > Agents > Advanced

These settings are specific for a given agent.

#### Service > IPBX > General settings > Advanced > Agent

These settings are global for all agents.

## 1.9.2 Queues

Call queues are used to distribute calls to the agents subscribed to the queue. Queues are managed on the *Services* → *Call Center* → *Queues* page.

A queue can be configured with the following options:

- Name: used as an unique id, cannot be `general`
- Display name: Displayed on the supervisor screen
- On-Hold music: The music the caller will hear. The music is played when waiting and when the call is on hold.

Fig. 1.78: *Services* → *Call Center* → *Queues* → *Add*

A ring strategy defines how queue members are called when a call enters the queue. A queue can use one of the following ring strategies:

- Linear: For each call, in the same order, starting from the same member
  - For agents: In login order
  - For static members: In definition order
- Least recent: call the member who least recently hung up a call
- Fewest calls: call the member with the fewest completed calls
- Round robin memory: call the “next” member after the one who answered last
- Random: call a member at random
- Weight random: same as random, but taking the member penalty into account
- Ring all: call all members at the same time

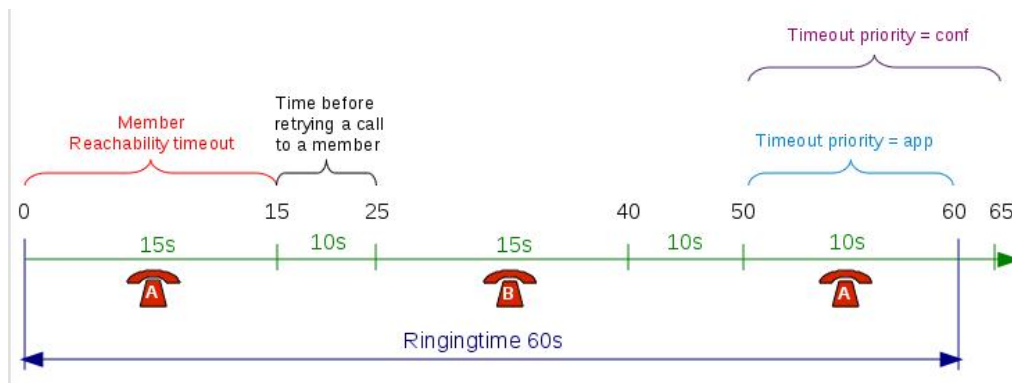

**Warning:** When editing a queue, you can’t change the ring strategy to linear. This is due to an asterisk limitation. Unfortunately, if you want to change the ring strategy of a queue to linear, you’ll have to delete it first and then create a new queue with the right strategy.

**Note:** When an agent is a member of many queues the order of call distribution between multiple queues is nondeterministic and cannot be configured.

## Timers

You may control how long a call will stay in a queue using different timers:

- Member reachability time out (Advanced tab): Maximum number of seconds a call will ring on an agent’s phone. If a call is not answered within this time, the call will be forwarded to another agent.
- Time before retrying a call to a member (Advanced tab): Used once a call has reached the “Member reachability time out”. The call will be put on hold for the number of seconds allotted before being redirected to another agent.
- Ringing time (Application tab): The total time the call will stay in the queue.
- Timeout priority (Application tab): Determines which timeout to use before ending a call. When set to “configuration”, the call will use the “Member reachability time out”. When set to “dialplan”, the call will use the “Ringing time”.

## No Answer

Calls can be diverted on no answer:

**Queues > Edit blue (3000@default)**

General Announces Members Application **No answer** Advanced Schedules Diversions

**No answer**

Destination : Queue

Redirect to : green (3006@default)

Ring time :

**Busy**

Destination : End call

Choice: Hangup

**Congestion**

Destination : User

Redirect to : Bill Johnson

Ring time :

**Fail**

Destination : Voicemail

Redirect to : 1456 (1456@default)

Play occupation message : ☐

Do not play introduction message : ☐

Do not play unavailable message : ☐

Use n+101 method : ☐

Save

- No answer: The call reached the “Ringing time” in Application tab and no agent answered the call
- Congestion: The number of calls waiting has reached the “Maximum number of people allowed to wait” limit specified on the advanced tab
- Fail: No agent was available to answer the call when the call entered the queue (“Join an empty queue” condition on the advanced tab) or the call was queued and no agents were available to answer (“Remove callers if there are no agents” on the advanced tab)

## Diversions

Diversions can be used to redirect calls to another destination when a queue is very busy. Calls are redirected using one of the two following scenarios:

The screenshot shows the 'Diversions' configuration page for a queue named 'foobar (3005@default)'. The page has several tabs: General, Announces, Members, Application, No answer, Advanced, Schedules, and Diversions. The 'Diversions' tab is active. There are two main sections for configuring diversion scenarios, each enclosed in a dashed box.

**On estimated wait time overrun**

- Maximum estimated wait time: 5 minutes (dropdown)
- Destination: End call (dropdown)
- Choice: Busy (dropdown)
- Delay before hangup: (text input)

**On number of waiting calls per logged-in agent overrun**

- Maximum number of waiting calls per logged-in agent: 1 (text input)
- Destination: End call (dropdown)
- Choice: Busy (dropdown)
- Delay before hangup: (text input)

A 'Save' button is located at the bottom of the configuration area.

The diversion check is done only once per call, before the *preprocess subroutine* is executed and before the call enters the queue.

In the following sections, a waiting call is a call that has entered the queue but has not yet been answered by a queue member.

### Estimated Wait Time Overrun

When this scenario is used, the administrator can set a destination for calls to be sent to when the average waiting time is over the threshold.

---

**Note:** The average waiting time of a queue is updated only when a queue member answers a call.

---

If a new call arrives when there are no waiting calls, the call will always be allowed to enter the queue.

### Number of Waiting Calls per Logged-In Agent Overrun

When this scenario is used, the administrator can set a destination for calls to be sent to when the number of waiting calls per logged-in agent is over the threshold.

The number of waiting calls includes the call for which the check is currently being performed.

The number of logged-in agents is the sum of user members and currently logged-in agent members. An agent only needs to be logged in and a member of the queue to participate towards the count of logged-in agents, regardless of whether he is available, on call, on pause or on wrapup.

The maximum number of waiting calls per logged-in agent can have a fractional part.

Here are a few examples:

```
Maximum number of waiting calls per logged-in agent: 1
Current number of waiting calls: 2
Current number of logged-in agents: 2
Number of waiting calls per logged-in agent when a new call arrives: 3 / 2 = 1.5
Call will be redirected
```

Maximum number of waiting calls per logged-in agent: 0.5 Number of waiting calls: 5 Number of logged-in agents: 12 Number of waiting calls per logged-in agent when a new call arrives: $6 / 12 = 0.5$ Call will not be redirected
--

If a new call arrives when there's no waiting calls, the call will always be allowed to enter the queue. For example, in the following scenario:

Maximum number of waiting calls per logged-in agent: 0.5 Current number of waiting calls: 0 Current number of logged-in agents: 1 Number of waiting calls per logged-in agent when a new call arrives: $1 / 1 = 1$
---

Even if the number of waiting calls per logged-in agent (1) is greater than the maximum (0.5), the call will still be accepted since there are currently no waiting calls.

## 1.9.3 Supervision

### Introduction

Allows a contact center supervisor to monitor contact center activities such as:

- Monitoring real time information from call queues
- Agent activities per call queues
- Agent detailed activities

### XiVO client as a Supervision Platform

#### Configuration

A supervisor profile defined in *Service* → *CTI Server* → *Profiles* menu usually contains the following Xlets :

- Identity
- Queues
- Queue members
- Queues (entries detail)
- Agents (list)
- Agents (detail)

**Note** You may also see the *Agent Status Dashboard*

#### Supervision Panel

- Clicking on a queue's name in the queue list will display the agent list in the xlet *Queue Members* and show waiting calls in the *Calls of a Queue* xlet.
- Clicking on an agent's name in the agent list will display information on the agent in the *Agent Details* xlet
- Clicking on the + icon in the *Agent Details* xlet will display information about the selected queue in the *Calls of a Queue* and *Queue Members* xlets.

The screenshot displays the XiVO interface with several panels. The 'Queues' panel at the top left shows a list of queues with columns: Number, Queues, Waiting calls, EWT, Longest wait, Talking, Logged, and Available. The 'Bakery' queue (301) is highlighted. The 'Queue Members' panel on the right shows a list of agents with columns: Number, Firstname, Lastname, Logged, Paused, Answered calls, Last call, and Penalty. The 'Agent Details' panel at the bottom left shows details for 'Bob Cat (102)' on 'xivo (default)'. Arrows indicate the flow of information from the queue list to the queue members and agent details.

## Queue List General information

The queue list is a dashboard displaying queue statistics and real-time counters for each queue configured on the XiVO.

Number	Queues	Waiting calls	EWT	Talking	Logged	Available	Received	Answered	Abandoned	Mean Waiting Time	Max Waiting Time	Efficiency	QOS
3947	UNIX	--	00:00	0	0	0	0	0	0	-	-	-	-
3256	tomato	--	00:00	0	0	0	0	0	0	-	-	-	-
3007	superqueue	--	00:00	0	N/A	0	0	0	0	-	-	-	-

## Real-time Columns

The data of following columns display real-time information.

**Queues** queue name and number if configured to be displayed

**Waiting calls** The number of calls currently waiting for an agent in this queue. The background color can change depending of the configured thresholds

**EWT** Estimated waiting time

**Longest wait** The longest waiting time for currently waiting calls. The background color can change depending of the configured thresholds

**Talking** The number of agents currently in conversation in the queue. This column is set to 0 when the queue has just been created and no members have been added.

**Logged** The number of logged agents in the queue. This column is set to “N/A” when the queue has just been created and no members have been added.

**Available** The number of available agents ready to take a call in the queue. This column is set to N/A when the queue has just been created and no members have been added.

## Last Period Columns

The data of following columns are based on statistics fetched from a fixed-width window of time, e.g. the last 60 minutes or the last 10 minutes. See below to configure the width of the window for each queue.

**Received** The number of calls received in this queue during the configured statistical window

**Answered** The number of calls answered in this queue during the configured statistical window

**Abandoned** The number of calls abandoned in this queue during the configured statistical window

**Mean waiting time** The mean wait time in the statistical time window, in mm:ss If no calls are received, “-” is displayed

**Max waiting time** The longest wait time in the statistical time window, in mm:ss If no calls are received, “-” is displayed

**Efficiency** Answered calls over received calls during the configured statistical window (unanswered calls that are still waiting are not taken into account). If no calls are received, “-” is displayed

**QOS** Percentage of calls taken within X seconds over answered calls during the configured statistical window. If no calls are received, “-” is displayed

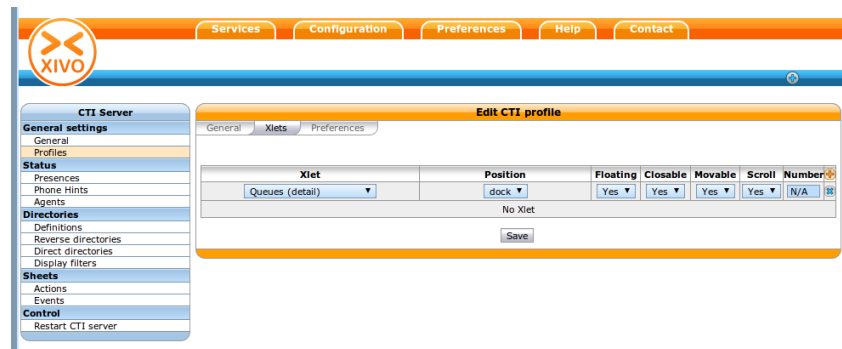

### Counter availability

When the XiVO client is started, “na” is displayed for counters that have not been initialized.

When the XiVO client is restarted, the counters are always displayed and calculated as if the application was not restarted. When the server is restarted, counters are reinitialized.

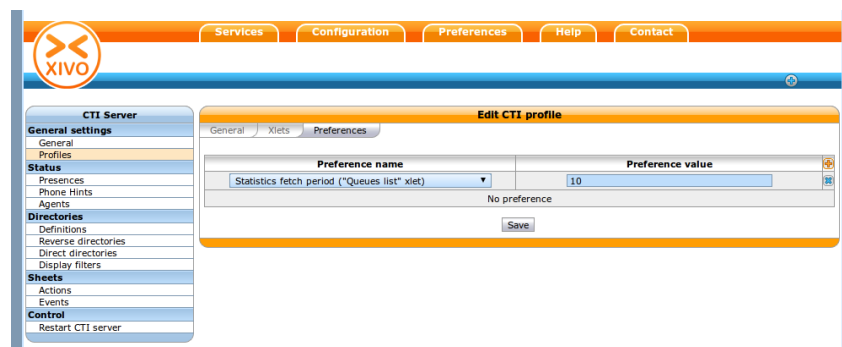

### Enabling the xlet

The xlet can be added to any CTI profile from the web interface.

### Configuration

Some values can be configured for the xlet. The statistic fetch timer can be set in the CTI profile preferences. This option is expressed in seconds and the default is 30 seconds.

The statistical period can be configured through the XiVO client once logged in by right-clicking on the Queue’s name in the *Queues* xlet. For each queue, you can configure the following information:

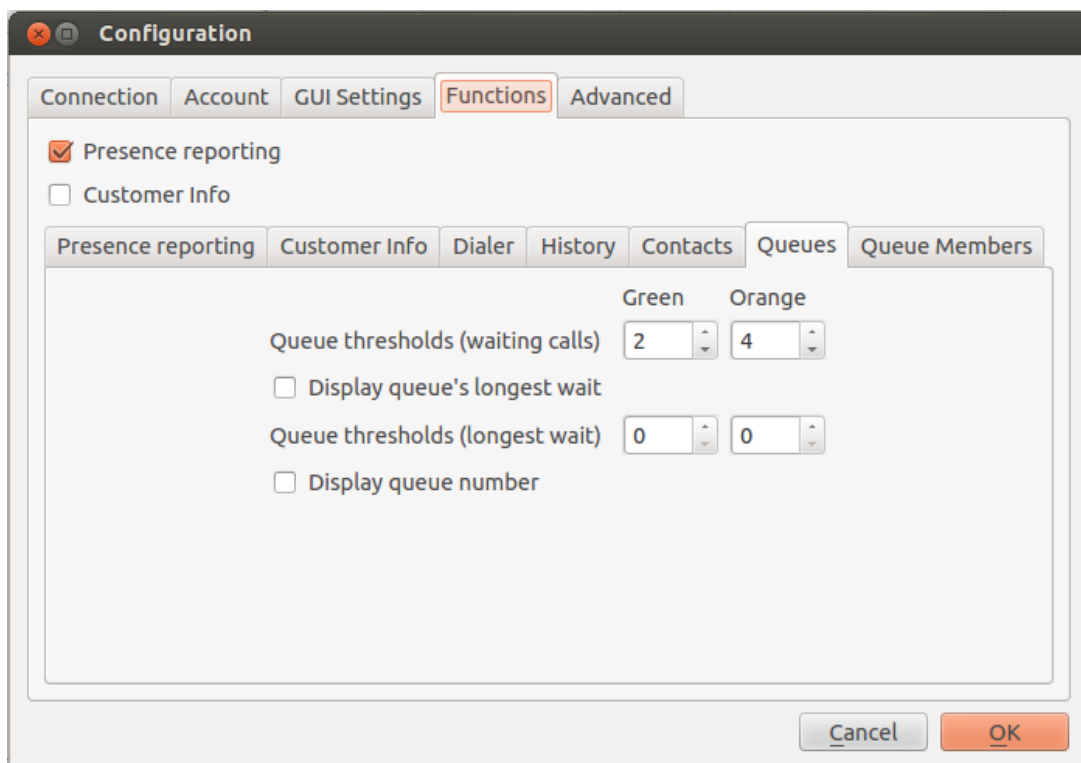

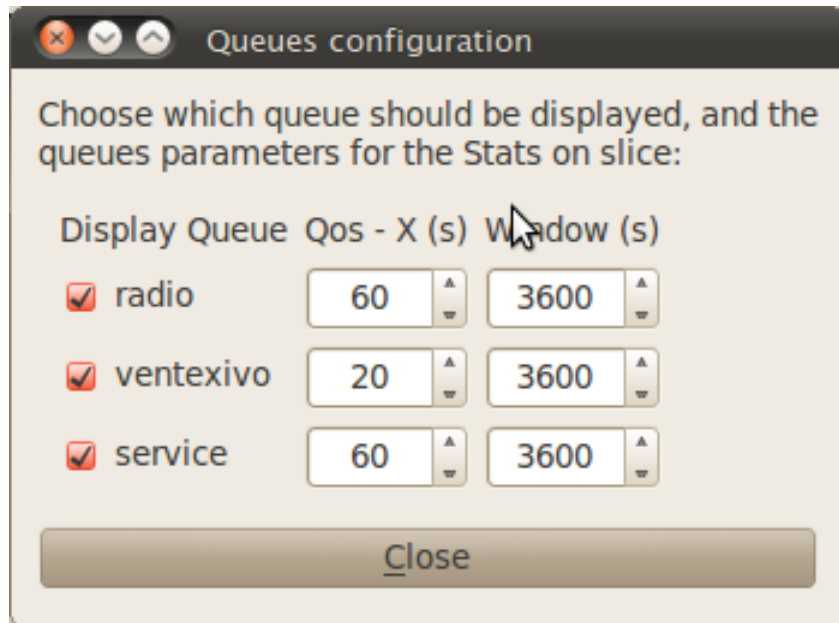

- Qos: maximum wait time for a call, in seconds.
- Window: period of time used for accumulating statistics, in seconds.

The data used to compute statistics on the XiVO server is only kept for a maximum of 3 hours. The window period cannot be configured to go beyond this limit.

Display options can also be set on the client side. A threshold can be configured to change the color of a column using the following parameters:

- Queue thresholds (waiting calls): number of waiting calls in the queue.
- Display queue’s longest wait: Add a column displaying the number of seconds the longest call has waited.
- Queue thresholds (longest wait): number of seconds for the longest waiting call in the queue.
- Display queue number: Add a column displaying the queue’s number.

## Monitoring queues on high dimension screens

You may want to display the queue list on one big screen, visible by multiple people. However, the default font will not be large enough, so the information will not be readable.

You can change the font size of this Xlet by giving a configuration file when launching the XiVO Client:

```
> xivoclient -stylesheet big_fonts.qss # Windows and Mac
$ xivoclient -- -stylesheet big_fonts.qss # GNU/Linux
```

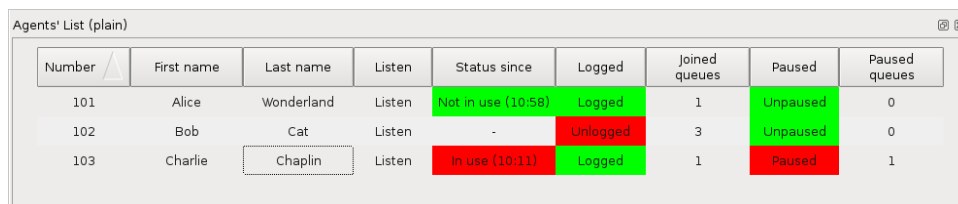

The `big_fonts.qss` file should contain:

```
QueuesView {font-size: 40px;}
QueuesView QHeaderView {font-size: 40px;}
```

Units of size that can be used are described on the [Qt documentation](#).

## Agent List General information

The queue list is a dashboard displaying each agent configured on the XiVO.

Number	First name	Last name	Listen	Status since	Logged	Joined queues	Paused	Paused queues
101	Alice	Wonderland	Listen	Not in use (10:58)	Logged	1	Unpaused	0
102	Bob	Cat	Listen	-	Unlogged	3	Unpaused	0
103	Charlie	Chaplin	Listen	In use (10:11)	Logged	1	Paused	1

### Columns

**Number** The agent's number

**First name & Last name** The agent's first name and last name

**Listen** A *clickable cell* to listen to the agent's current call.

Clicking on the cell will make your phone ring. When you'll answer, you'll hear the conversation the agent is having.

You'll then be able to press the following digits on your phone to switch between the different "listen" modes:

- 4 - spy mode (default). No one hears you.
- 5 - whisper mode. Only the agent hears you.
- 6 - barge mode. Both the agent and the person he's talking to hear you.

**Status since** Shows the agent's status and the time spent in this status. An agent can have three statuses:

- *Not in use* when he is ready to answer an ACD call
- *Out of queue* when he called or answered a call not from the queue
- *In use* when he is either on call from a queue, on pause or on wrapup

**Logged** A *clickable cell* to log or unlog the agent

**Joined queues** The number of queues the agent will be receiving calls from

**Paused** A *clickable cell* to pause or unpause the agent

**Paused queues** The number of queues in which the agent is paused

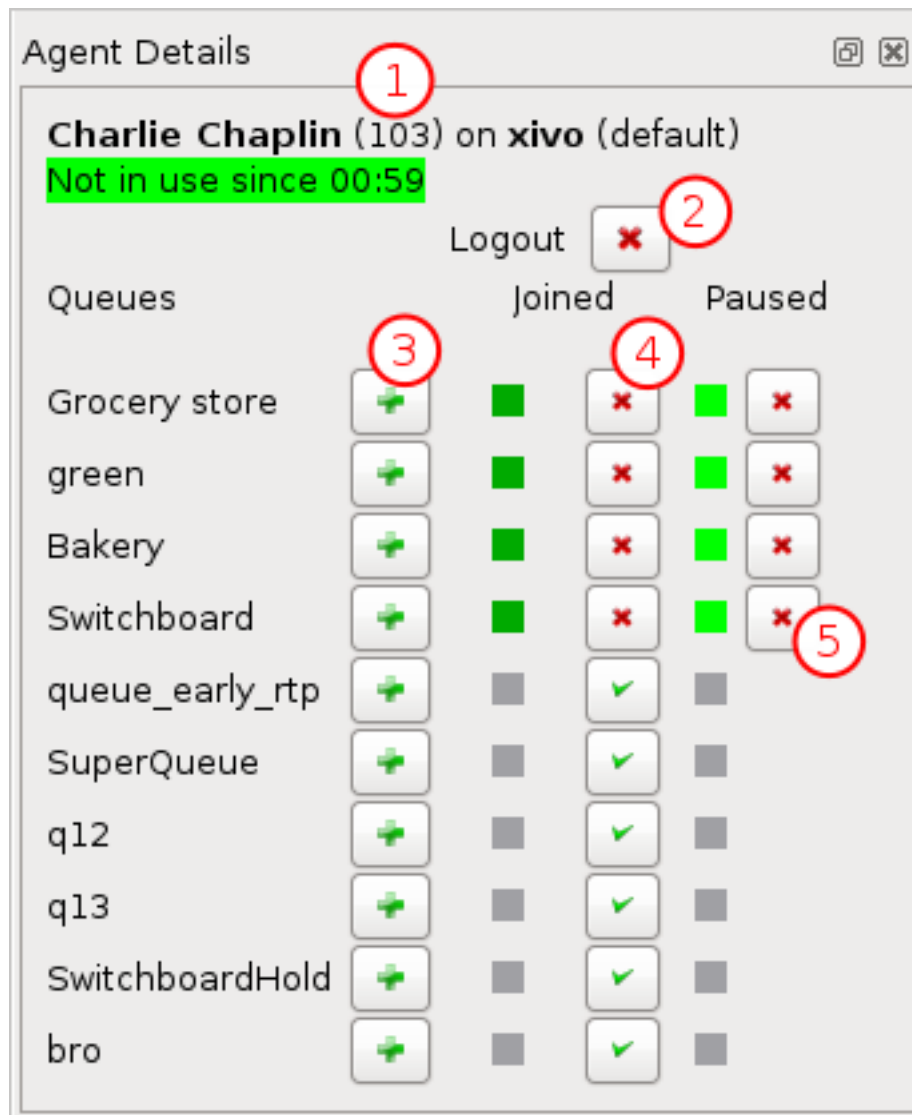

Fig. 1.79: Agent Details

## Agent Details General information

Display advanced informations of an agent and enable to login/logoff, add/remove to a queue, and pause/unpause.

1. This is the status information of agent
2. Button to login/logoff agent
3. Supervision button of the Xlet “Calls of a queue”
4. Add/Remove agent for given queue
5. Pause/Unpause button for given queue

**Queue members** The queue members lists which agents or phones will receive calls from the selected queue and some of their attributes.

Queue Members							
Épicerie (301@default) : 2 agent(s) and 2 phone(s)							
Number	Firstname	Lastname	Logged	Paused	Answered calls	Last call	Penalty
101	Alice	Wonderland	Logged in	Not paused	0		2
1151	Yoda	Kenobi			0		0
	Paul	Castagnette			0		0
102	Bob	Cat	Logged out	Not paused	0		6

### Columns

**Number** The agent number or the phone number of the queue member.

**Firstname and Lastname** First name and last name of the agent or the user to which the phone belongs.

**Logged** Whether the agent is logged or not. Blank for a phone.

**Paused** Whether the agent is paused or not. Blank for a phone.

**Answered calls** Number of calls answered by the member since last login (for an agent), or restart or configuration reload.

**Last call** Hangup time of the last answered calls.

**Penalty** Penalty of the queue member.

### Link XiVO Client presence to agent presence

You can configure XiVO to have the following scenario:

- The agent person leaves temporarily his office (lunch, break, ...)
- He sets his presence in the XiVO Client to the according state
- The agent will be automatically set in pause and his phone will not ring from queues
- He comes back to his office and set his presence to ‘Available’
- The pause will be automatically cancelled

You can *configure the presence states* of CTI profiles and attach *Actions* to them, such as *Set in pause* or *Enable DND*.

You can then attach an action *Set in pause* for multiple presence states and attach an action *Cancel the pause* for the presence state *Available*.

For now, the actions attached to the mandatory presence *Disconnected* will not be taken into account.

## 1.9.4 Agent Status Dashboard

### Overview

The goal of the agent status dashboard xlet is to give contact center supervisors a better overview of agent status evolution in active queues.

The screenshot displays the 'Agent status dashboard' interface. It features a grid of panels, each representing a queue. Each panel contains a table of agent status boxes. Each box shows an agent ID (e.g., A. 9025), their current status (e.g., 'Not in use'), and the time spent in that status (e.g., '00:24'). The status boxes are color-coded: green for 'Not in use', orange for 'In use', and purple for 'Int. Incoming' or 'Int. Outgoing'. The queues shown include Queue 11002, Queue 11001, Ghost 11008, Queue 11000, Queue 11007, Queue 11004, Queue 11005, and Queue 11006.

### Usage

The xlet is *read-only* and presents a list of queues. For each queue, the xlet displays a status box for each logged in agent. Each status box gives the following information:

- Agent name
- Agent status: Shows the agent's status. An agent can have six statuses:
  - *Not in use* when he is ready to answer an ACD call
  - *Int. Incoming* when he answered an internal call not from a queue
  - *Int. Outgoing* when he emitted an internal call not from a queue
  - *Ext. Incoming* when he answered an external call not from a queue
  - *Ext. Outgoing* when he emitted an external call not from a queue
  - *In use* when he is either on call a from a queue, on pause or on wrapup
- Agent status since: Shows the time spent in the current status
- Background color:
  - green if *Not in use*
  - purple if *Int. Incoming* or *Int. Outgoing*
  - pink if *Ext. Incoming* or *Ext. Outgoing*
  - orange if *In use*

Note that the agent status will only change when the communication is established, not when phones are ringing.

## Known bugs

1. If an agent emits a call via his XiVO Client, the status will change to *Int. Outgoing* or *Ext. Outgoing* when the destination phone rings, instead of when the destination answers.
2.
  - Given the agent is on an ACD call
  - When the agent logs out
  - When the agent hangs up the ACD call
  - When the agent logs back in via CTI Client
  - Then the agent may be seen as outgoing non-ACD communication, whether there is a non-ACD communication or not

To make the agent *Not in use* again, make a non-ACD call and hangup.

3.
  - Given the agent is on ACD call
  - When the agent calls someone else (e.g. his supervisor)
  - When the ACD call hangs up (while the agent talks to his supervisor)
  - Then the agent is seen as available, instead of in outgoing non-ACD communication.

This applies to all kinds of non-ACD calls.

## Changing the disposition

The disposition of the Xlet can be changed in two ways:

- Placement of queues
- Which queues are displayed

The disposition is saved whenever the XiVO Client is closed and restored when it is opened again.

## Changing the placement of queues

The little windows containing each queue can be resized and moved around. That way, any layout can be achieved, according to the size and importance of each queue.

## Choosing which queues are displayed

There is a little contextual menu when right-clicking on the title bar of every queue window. Checking/unchecking the lines of this menu shows/hides the associated queue.

## Known issues

- There is no profile containing this xlet. The profile must be created manually.
- There is no sorting on agents in a queue.
- An empty queue will display an empty box with no message specifying the queue has no logged agents.

## Configuration

No special configuration is necessary other than creating a CTI profile in which the Agent Status Dashboard is added.

## 1.9.5 Skills-Based Routing

### Introduction

*Skills-based routing (SBR), or Skills-based call routing, is a call-assignment strategy used in call centres to assign incoming calls to the most suitable agent, instead of simply choosing the next available agent. It is an enhancement to the Automatic Call Distributor (ACD) systems found in most call centres. The need for skills-based routing has arisen, as call centres have become larger and dealt with a wider variety of call types.*

—Wikipedia

In this respect, skills-based routing is also based on call distribution to agents through waiting queues, but one or many skills can be assigned to each agent, and call can be distributed to the most suitable agent.

In skills-based routing, you will have to find a way to be able to tag the call for a specific skill need. This can be done for example by entering the call distribution system using different incoming call numbers, using an IVR to let the caller do his own choice, or by requesting to the information system database the customer profile.

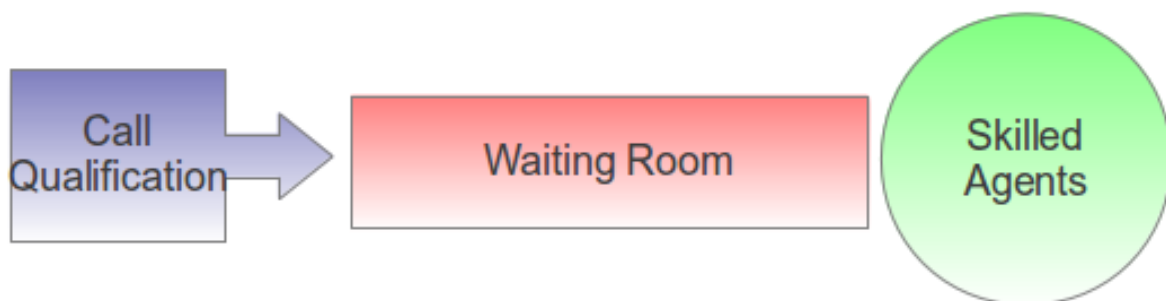

Fig. 1.80: Skills-Based Routing

### Getting Started

- Create the skills

- Apply the skills to the agents
- Create the skill rule sets
- Assign the skill rule sets using a configuration file
- Apply the skill rule sets to call qualification, i.e. incoming calls by using the preprocess subroutine field

Note that you shouldn't use skill based routing on a queue with queue members of type user because the behaviour is not defined and might change in a future XiVO version.

## Skills

Skills are created using the menu *Services* → *Call center* → *Skills*. Each skill belongs to a category. First create the category, and in this category create different skills.

Note that a skill name can't contain upper case letters and must be globally unique (i.e. the same name can't be used in two different categories).

Skills > Edit

Category: language

Values:

Name	Description	
english		+
french		-

Save

Fig. 1.81: Skills Creation

Once all the skills are created you may apply them to agents. Agents may have one or more skills from different categories.

Agents > Add an agent

General Users Queues **Queueskills** Advanced

Skill	Weight	
english	75	+
french	25	-

Save

Fig. 1.82: Apply Skills to Agents

It is typical to use a value between 0 and 100 inclusively as the weight of a skill, although any integer is accepted.

## Skill Rule Sets

Once skills are created, rule sets can be defined.

A rule set is a list of rules. Here's an example of a rule set containing 2 rules:

1. WT < 60, english > 50
2. english > 0

The first rule of this rule set can be read as:

If the caller has been waiting for less than 60 seconds ( $WT < 60$ ), only try to call agents which have the skill “english” set to a value higher than 50; otherwise, go to the next rule.

And the second rule can be read as:

Only try to call agents which have the skill “english” set to a value higher than 0.

Let’s examine some simple scenarios, because there’s actually some subtleties on how calls are distributed. We will suppose that we have a queue with the default settings and the following members:

- Agent A, with skill english set to 75
- Agent B, with skill english set to 25

### Scenario 1

Given:

- Agent A is logged and not in use
- Agent B is logged and not in use
- There is no call in the queue

When a new call enters the queue, then it is distributed to Agent A. As long as Agent A is available and doesn’t answer the call, the call will never be distributed to Agent B, even after 60 seconds of waiting time.

When another call enters the queue, then after 60 seconds of waiting time, this call will be distributed to Agent B (and the first call will still be distributed only to Agent A).

The reason is that there’s a difference between a call that is being distributed (i.e. that is making agents ring) and a call that is waiting for being distributed. When a call is being distributed to a set of members, no other rule is tried as long as there’s at least 1 of these members available.

### Scenario 2

Given:

- Agent A is not logged
- Agent B is logged and not in use
- There is no call in the queue

When a new call enters the queue, then it is *immediately* distributed to Agent B.

The reason is that when there’s no logged agent matching a rule, the next rule is immediately tried.

### Rules

Each rule set is composed of rules, and each rule has two parts, separated by a comma:

- the first part (optional) is the “*dynamic part*”
- the second part is the “*skill part*”

Each part contains an expression composed of operators, variables and integer constants.

## Operators

The following operators can be used inside rules:

Comparison operators:

- operand1 ! operand2 (is not equal)
- operand1 = operand2 (is equal)
- operand1 > operand2 (is greater than)
- operand1 < operand2 (is lesser than)

Logical operators:

- operand1 & operand2 (both are true)
- operand1 | operand2 (at least one of them are true)

‘!’ is the operator with the higher priority, and ‘|’ the one with the lower priority. You can use parentheses ‘()’ to change the priority of operations.

## Dynamic Part

The dynamic part can reference the following variables:

- WT
- EWT

The waiting time (WT) is the elapsed time since the call entered the queue. The time the call pass in an IVR or another queue is not taken into account.

The estimated waiting time (EWT) has never fully worked. It is mentioned here only for historical reason. You should not use it. It might be removed in a future XiVO version.

### Examples

- WT < 60

## Skill Part

The skill part can reference any skills name as variables.

You can also use meta-variables, starting with a ‘\$’, to substitute them with data set on the Queue() call. For example, if you call Queue() with the skill rule set argument equal to:

`select_lang(lang=german)`

Then every \$lang occurrence will be replaced by ‘german’.

### Examples

- english > 50
- technic ! 0 & (\$os > 29 & \$lang > 39 | \$os > 39 & \$lang > 19)

## Evaluation

Note that the expression:

english | french

is equivalent to:

english ! 0 | french ! 0

Rules of expertise > Edit

Name:

Rules	
WT < 10 , \$lang > 90	+
\$lang > 40	+

Fig. 1.83: Create Skill Rule Sets

Sometimes, a rule references a skill which is not defined for every agent. For example, given the following rule:

```
english > 0 | english < 1
```

Then, for an agent which has the skill english defined, the result of this expression is always true. For an agent which does not have the skill english defined, the result of this expression is always false.

Said differently, an agent without a skill X is not the same as an agent with the skill X set to the value 0.

Technically, this is what is happening when evaluating the rule “english > 0” for an agent without the skill english:

```

english > 0
=    <Substituting english with the agent value>
    "undefined" > 0
=    <A comparison with "undefined" in at least one operand yields undefined>
    "undefined"
=    <In a boolean context, "undefined" is equal to false>
    false

```

This behaviour applies to every comparison operators.

Also, the syntax that is currently accepted for comparison is always of the form:

```
variable cmp_op constant
```

Where “variable” is a variable name, “cmp\_op” is a comparison operator and “constant” is an integer constant. This means the following expressions are not accepted:

- 10 < english (but english > 10 is accepted)
- english < french (the second operand must be a constant)
- 10 < 11 (the first operand must be a variable name)

## Apply Skill Rule Sets

A skill rule set is attached to a call using a bit of dialplan. This dialplan is stored in a configuration file you may edit using menu *Services* → *IPBX* → *Configuration Files*.

In the figure above, 3 different languages are selected using three different subroutines.

Each of this different selections of subroutines can be applied to the call qualifying object. In the following example language selection is applied to incoming calls.

### Example

Configuration file for simple skill selection :

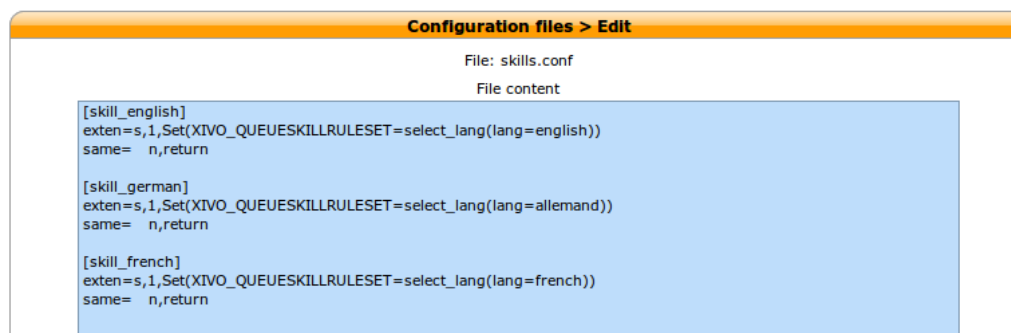

Fig. 1.84: Use Rule Set In Dialplan

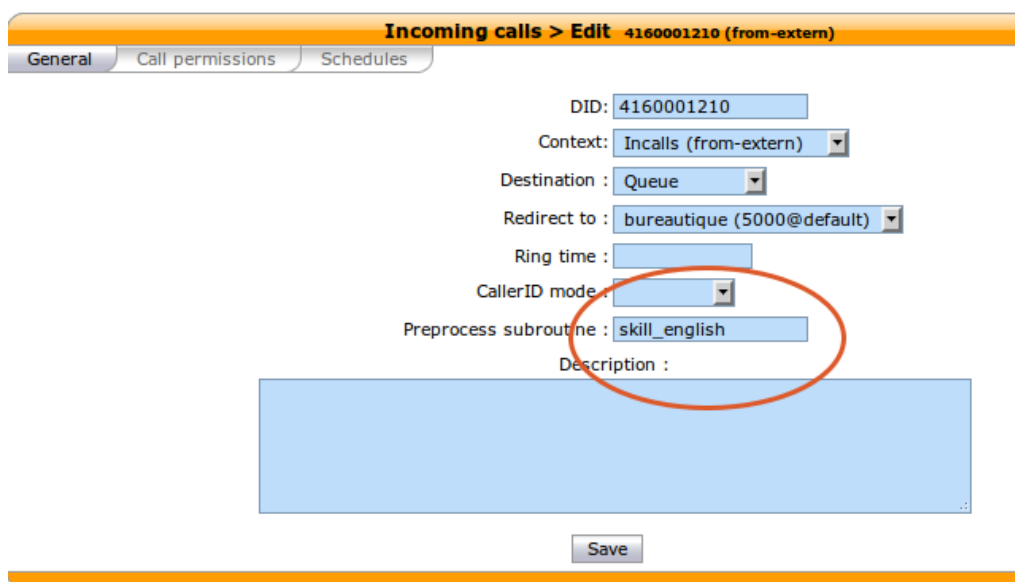

Fig. 1.85: Apply Rule Set to Incoming Call

```
[simple_skill_english]
exten = s,1,Set(XIVO_QUEUESKILLRULESET=english_rule_set)
same = n,Return()

[simple_skill_french]
exten = s,1,Set(XIVO_QUEUESKILLRULESET=french_rule_set)
same = n,Return()
```

## Monitoring

You may monitor your waiting calls with skills using the asterisk CLI and the command `queue show <queue_name>`:

```
xivo-jylebleu*CLI> queue show services
services has 1 calls (max unlimited) in 'ringall' strategy (0s holdtime, 2s talktime), W:0, C:1, I:1
Members:
  Agent/2000 (Not in use) (skills: agent-1) has taken no calls yet
  Agent/2001 (Unavailable) (skills: agent-4) has taken no calls yet
Virtual queue english:
Virtual queue french:
  1. SIP/jyl-dev-assur-00000017 (wait: 0:05, prio: 0)
Callers:
```

You may monitor your skills groups with the command `queue show skills groups <agent_name>`:

```
xivo-jylebleu*CLI> queue show skills groups <PRESS TAB>
agent-2 agent-3 agent-4 agent-48 agent-7 agent-1
xivo-jylebleu*CLI> queue show skills groups agent-1
Skill group 'agent-1':
- bank : 50
- english : 100
```

You may monitor your skills rules with the command `queue show skills rules <rule_name>`:

```
xivo-jylebleu*CLI> queue show skills rules <PRESS TAB>
english french select_lang
xivo-jylebleu*CLI> queue show skills rules english
Skill rules 'english':
=> english>90
```

## 1.9.6 Statistics

### Overview

The statistics page is used to monitor the efficiency of queues and agents. Statistics are automatically generated every six hours. They can also be generated manually.

---

**Note:** The contact center statistics do not apply to switchboard queues. See [Switchboard](#) for more details.

---

---

**Note:** The oldest statistics are periodically removed. See [Purge Logs](#) for more details.

---

### Configuration

In order to display call center statistics, you must create at least one configuration profile.

Fig. 1.86: Statistics Configuration

The configuration profile is used to generate reports from the cache. The cache is generated independently from the configuration so adding a new configuration does not require a new cache generation.

### Configuration options

Field	Values	Description
name	string	Configuration name, useful for remembering what the configuration is used for
interval	enum [0-999] [day, week, month]	Default time interval used when displaying statistics. Examples: “-1 day”: show statistics for yesterday “-3 weeks”: show statistics for the last 3 weeks
show on summary page		Display this configuration on the summary page
timezone	Amer-ica/Montreal	Your time zone
<b>Period cache</b>		Maximum and minimum dates that can be used for displaying statistics
start	YYYY-MM	Start date
end	YYYY-MM	End date. If left to 0, use the servers’ current date
<b>Working Hours</b>		Work hours for agents
start	hh:mm	Beginning of working hours.
end	hh:mm	End of working hours
<b>Periods</b>		Number of calls answered for a time period
Period 1	number of seconds (Example: 20)	Show number of calls answered within 20 seconds in column “P1”
Period n	number of seconds (Example: 20)	Show number of calls answered within 20 seconds in column “Pn”

**Note:** Calls outside of working hours will not be in the cache. e.g. if working hours are from 8:00 AM to 16:00 PM, a call at 7:55 AM will not show up in the reports.

**Note:** Statistics are computed on the hour. e.g. If work hours are from 8:30 to 16:15, working hours should be set from 8:00 to 17:00.

---

**Note:** Period includes both bounds, if the same number is used for the higher bound and the lower bound of next period, some calls will be counted twice. i.e period 1 : 0-30 period 2 : 31-60 period 3 : 61

---

### How to generate the cache

The cache must be generated before using reports. By default, the cache is automatically generated every six hours.

However, you can safely generate it manually. The script to generate the cache is *xivo-stat fill\_db*. When this script is run, statistics will be regenerated for the last 8 hours starting from the previous hour. e.g. If you run *xivo-stat* on 2012-08-04 11:47:00, statistics will be regenerated from 2012-08-04 03:00:00 to 2012-08-04 11:47:00

---

**Note:** *xivo-stat fill\_db* can be a long operation when used for the first time or after a *xivo-stat clean\_db*

---

**Warning:** The current events have an end date of the launch date of the script *xivo-stat* as the end date.

### Clearing the cache

If for some reason the cache generation fails or the cache becomes unusable, the administrator can safely clean the cache using *xivo-stat clean\_db* and then regenerate it. This operation will only clear the cache and does *not* erase any other data.

### Queue statistics

Queue statistics can be viewed in *Services* → *Statistics* → *Queue*.

The first table displays a list of queues with all the counters for the period choosen from the Dashboard panel

	Dissuaded or Overflowed									
	Received	Answered	Abandoned	Closed	Saturated	NA	Blocking	AWT	Answered rate	QoS
STA1	1749	1521	84	21	0	0	123	00:00:13	88 %	0 %
STA2	1713	1454	73	38	0	0	148	00:00:11	86 %	0 %
STA3	1529	1367	76	23	0	0	63	00:00:10	90 %	0 %
STA4	2147	1776	115	17	0	0	239	00:00:16	83 %	0 %
STA5	1800	1594	93	28	0	0	85	00:00:13	89 %	0 %

By clicking on a queue name you may display detailed queue statistics

Statistics can be displayed :

**By week**

**By month**

**By year**

#### Counters

- Received: Total number of received calls
- Answered: Calls answered by an agent
- Abandoned: Calls that were hung up while waiting for an answer

Total call distributed

- Dissuaded or Overflowed:
  - Closed: Calls received when the queue was closed
  - No answer (NA): Calls that reached the ring timeout delay
  - Saturated: Calls received when the queue was already full (“Maximum number of people allowed to wait:” limit of advanced tab) or when one of the diversion parameters were reached
  - Blocking : Calls received when no agents were available or when there were no agents to take the call, join an empty queue condition or remove callers if there are no agents condition is reached (advanced queue parameter tab).
- Average waiting time (AWT): The average waiting time of call on wait
- Answered rate (HR): The ratio of answered calls over (received calls - closed calls)
- Quality of service (QoS): Percentage of calls answered in less than x seconds over the number of answered calls, where x is defined in the configuration

## Agent performance

Agent performance statistics can be viewed in *Services* → *Statistics* → *Performance agents*.

**Note:** The agent performance counters do not take into account transfer between agents: if agent A processes a call and transfers it to agent B, only the counters of agent A will be updated. Ignoring any info after the call transfer.

## Counters

- Answered: Number of calls answered by the agent
- Conversation: Total time spent for calls answered during a given period
- Login: Total login time of an agent.
- Wrapup: Total time spent in wrapup by an agent.
- Pause: Total pause time of an agent

**Warning:** Data generated before XiVO 12.19 might have erroneous results for the Login time counter

**Note:** The Pause time counter only supports **PAUSEALL** and **UNPAUSEALL** command from eticlient

**Note:** Wrapup time events were added to XiVO in version 12.21

## Agent summary

## 1.9.7 Reporting

You may use your own reporting tools to be able to produce your own reports provided **you do not use the XiVO server original tables**, but copy the tables to your own data server. You may use the following procedure as a template :

- Allow remote database access on XiVO
- Create a postgresql account read only on asterisk database
- Create target tables in your database located on the data server
- Copy the statistic table content to your data server

## General Architecture

1. The *queue\_log* table of the *asterisk* database is filled by events from Asterisk and by custom dialplan events
2. *xivo-stat fill\_db* is then used to read data from the *queue\_log* table and generate the tables *stat\_call\_on\_queue* and *stat\_queue\_periodic*
3. The web interface generate tables and graphics from the *stat\_call\_on\_queue* and *stat\_queue\_periodic* tables depending on the selected configuration

## Statistic Data Table Content

### stat\_call\_on\_queue

This table is used to store each call individually. Each call received on a queue generates a single entry in this table containing time related fields and a foreign key to the agent who answered the call and another on the queue on which the call was received.

It also contains the status of the call ie. answered, abandoned, full, etc.

Field	Values	Description
id	generated	
callid	numeric value	This call id is also used in the CEL table and can be used to get call detail information
time	Call time	
ring-time		Ringing duration time in seconds
talk-time		Talk time duration in seconds
wait-time		Wait time duration in seconds
status		See status description below
queue_id		Id of the queue, the name of the queue can be found in table <code>stat_queue</code> , using this name queue details can be found in table <code>queuefeatures</code>
agent_id		Id of the agent, the agent name can be found in table <code>stat_agent</code> , using this name agent details can be found in table <code>agentfeatures</code> using the number in the second part of the name Example : Agent/1002 is agent with number 1002 in table <code>agentfeatures</code>

### Queue Call Status

Status	Description
full	Call was not queued because queue was full, happens when the number of calls is greater than the maximum number of calls allowed to wait
closed	Closed due to the schedule applied to the queue
joinempty	No agents were available in the queue to take the call (follows the join empty parameter of the queue)
leaveempty	No agents available while the call was waiting in the queue
divert_ca_ratio	Call diverted because the ratio number of agent number of calls waiting configured was exceeded
divert_waittime	Call diverted because the maximum expected waiting time configured was exceeded
answered	Call was answered
abandoned	Call hangup by the caller
timeout	Call stayed longer than the maximum time allowed in queue parameter

### stat\_queue\_periodic Table

This table is an aggregation of the `queue_log` table.

This table contains counters on each queue for each given period. The granularity at the time of this writing is an hour and is not configurable. This table is then used to compute statistics for a given range of hours, days, week, month or year.

Field	Description
id	Generated id
time	time period, all counters are aggregated for an hour
answered	Number of answered calls during the period
abandoned	Number of abandoned calls during the period
total	Total calls received during the period
full	Number of calls received when queue was full
closed	Number of calls received on close
joinempty	Number of calls received no agents available
leaveempty	Number of calls diverted agents not available during the wait
di-vert_ca_ratio	Number of calls diverted due to the number of agent number versus calls waiting configured was exceeded
di-vert_waittime	Number of calls diverted because the maximum expected waiting time configured was exceeded
timeout	Number of calls diverted because the maximum time allowed in queue parameter was exceeded
queue_id	

### stat\_agent

This table is used to match agents to an id that is different from the id in the agent configuration table. This is necessary to avoid losing statistics on a deleted agent. This also means that if an agent changes number ie. Agent/1001 to Agent/1202, the supervisor will have to take this information into account when viewing the statistics. Affecting an old number to a another agent also means that the supervisor will have to ignore entries for this given agent for the period before the number assignment to the new agent.

### stat\_queue

This table is used to store queues in a table that is different from the queue configuration table. This is necessary to avoid losing statistics on a deleted queue. Renaming a queue is also not handled at this time.

## 1.10 High Availability (HA)

The HA (High Availability) solution in XiVO makes it possible to maintain basic telephony function whatever your main XiVO server is running or not. When running a XiVO HA cluster, users are guaranteed to never experience a downtime of more than 5 minutes of their basic telephony service.

The HA solution in XiVO is based on a 2-nodes “master and slave” architecture. In the normal situation, both the master and slave nodes are running in parallel, the slave acting as an “hot standby”, and all the telephony services are provided by the master node. If the master fails or must be shutdown for maintenance, then the telephony devices automatically communicate with the slave node instead of the master one. Once the master is up again, the telephony devices failback to the master node. Both the failover and the failback operation are done automatically, i.e. without any user intervention, although an administrator might want to run some manual operations after failback as to, for example, make sure any voicemail messages that were left on the slave are copied back to the master.

### 1.10.1 Prerequisites

The HA in XiVO only works with telephony devices (i.e. phones) that support the notion of a primary and backup telephony server.

- The master and the slave must be in the same subnet
- If firewalling, the master must be allowed to join the slave on port 5432

- Trunk registration timeout (`expiry`) should be less than 300 seconds (5 minutes)

The HA solution is guaranteed to work correctly with *the following devices*.

### 1.10.2 Quick Summary

- You need two configured XiVO (wizard passed)
- Configure one XiVO as a master -> setup the slave address
- Restart services (`xivo-service restart`) on master
- Configure the other XiVO as a slave -> setup the master address
- Configure file synchronization by running the script `xivo-sync -i` on the master
- Start configuration synchronization by running the script `xivo-master-slave-db-replication <slave_ip>` on the master
- Resynchronize all your devices
- Configure the XiVO Clients

That's it you now have a HA configuration, and every hour all the configuration done on the master will be reported to the slave.

### 1.10.3 Configuration Details

First thing to do is to *install 2 XiVO*.

---

**Important:** When you upgrade a node of your cluster, you must also upgrade the other so that they both are running the same version of XiVO. Otherwise, the replication might not work properly.

---

You must configure the HA in the Web interface (*Configuration* → *Management* → *High Availability* page).

You can configure the master and slave in whatever order you want.

You must also run `xivo-sync -i` on the master to setup file synchronization. Running `xivo-sync -i` will create a passwordless SSH key on the master, stored under the `/root/.ssh` directory, and will add it to the `/root/.ssh/authorized_keys` file on the slave. The following directories will then be rsync'ed every hour:

- `/etc/asterisk/extensions_extra.d`
- `/etc/xivo/asterisk`
- `/var/lib/asterisk/agi-bin`
- `/var/lib/asterisk/moh`
- `/var/lib/consul/raft`
- `/var/lib/xivo/sounds/acd`
- `/var/lib/xivo/sounds/playback`

**Warning:** When the HA is configured, some changes will be automatically made to the configuration of XiVO.

SIP expiry value on master and slave will be automatically updated:

- min: 3 minutes
- max: 5 minutes
- default: 4 minutes

**SIP Protocol properties**

Save

Fig. 1.89: Configuration → Provisioning → Template Line → Edit default

**Warning:** Especially not change these values when the HA is configured, this could cause problems. These values will be reset to blank when the HA is disabled.

**Important:** For the telephony devices to take the new proxy/registrar settings into account, you must *resynchronize the devices* or restart them manually.

## Disable node

Default status of HIGH AVAILABILITY (HA) is disabled:

**Note:** You can reset at any time by choosing a server mode (disabled)

Fig. 1.90: HA Dashboard Disabled (default state)

**Important:** You have to restart services (xivo-service restart) once the master node is disabled.

## Master node

In choosing the method `Master` you must enter the IP address of the slave node.

Fig. 1.91: HA Dashboard Master

**Important:** You have to restart all services (xivo-service restart) once the master node is configured.

## Slave node

In choosing the method `Slave` you must enter the IP address of master node.

Fig. 1.92: HA Dashboard Slave

## Configuration Replication

Once master slave configuration is completed, XiVO configuration is replicated from the master node to the slave every hour (:00).

Replication can be started manually by running the replication scripts on the master:

```
xivo-master-slave-db-replication <slave_ip>
xivo-sync
```

The replication does not copy the full XiVO configuration of the master. Notably, these are excluded:

- All the network configuration (i.e. everything under the *Configuration* → *Network* section)
- All the support configuration (i.e. everything under the *Configuration* → *Support* section)
- Call logs
- Call center statistics
- Certificates
- HA settings
- Provisioning configuration
- Voicemail messages

Less importantly, these are also excluded:

- Queue logs
- CELs

## XiVO Client

You have to enter the master and slave address in the *Connection* tab of the XiVO Client configuration :

The main server is the master node and the backup server is the slave node.

When connecting the XiVO Client with the main server down, the login screen will hang for 3 seconds before connecting to the backup server.

### 1.10.4 Internals

4 scripts are used to manage services and data replication.

- `xivo-master-slave-db-replication <slave_ip>` is used on the master to replicate the master's data on the slave server. It runs on the master.
- `xivo-manage-slave-services {start,stop}` is used on the slave to start, stop `monit` and `asterisk`. The services won't be restarted after an upgrade or restart.
- `xivo-check-master-status <master_ip>` is used to check the status of the master and enable or disable services accordingly.
- `xivo-sync` is used to sync directories from master to slave.

### 1.10.5 Limitations

When the master node is down, some features are not available and some behave a bit differently. This includes:

- Call history / call records are not recorded.
- Voicemail messages saved on the master node are not available.
- Custom voicemail greetings recorded on the master node are not available.
- Phone provisioning is disabled, i.e. synchronizing or rebooting a phone will make it unusable until the master is back up, unless you have manually configured your slave, e.g. reconfigured the DHCP server of the slave.

Note that, on failover and on failback:

- DND, call forwards, call filtering, ..., statuses may be lost if changed recently.
- If you are connected as an agent, then you might need to reconnect as an agent when the master goes down. Since it's hard to know when the master goes down, if your CTI client disconnect and you can't reconnect it, then it's a sign the master might be down.

Additionally, only on failback:

- Voicemail messages are not copied from the slave to the master, i.e. if someone left a message on your voicemail when the master was down, you won't be able to consult it once the master is up again.
- More generally, custom sounds are not copied back. This includes recordings.

Here's the list of limitations that are more relevant on an administrator standpoint:

- In the case a DHCP server is running on the master node, then when the master is down, phones won't be able to get a new DHCP lease, so it is advised not to restart the phones.
- The master status is up or down, there's no middle status. This mean that if Asterisk is crashed the XiVO is still up and the failover will NOT happen.

## 1.10.6 Berofos Integration

### Berofos Integration

XiVO offers the possibility to integrate a [berofos failover switch](#) within a HA cluster.

This is useful if you have one or more ISDN lines (i.e. T1/E1 or T0 lines) that you want to use whatever the state of your XiVO HA cluster. To use a berofos within your XiVO HA installation, you need to properly configure both your berofos and your XiVOs, then the berofos will automatically switch your ISDN lines from your master node to your slave node if your master goes down, and vice-versa when it comes back up.

You can also use a Berofos failover switch to secure the ISDN provider lines when installing a XiVO in front of an existing PBX. The goal of this configuration is to mitigate the consequences of an outage of the XiVO : with this equipment the ISDN provider links could be switched to the PBX directly if the XiVO goes down.

XiVO **does not offer natively** the possibility to configure Berofos in this failover mode. The [Berofos Integration with PBX](#) section describes a workaround.

### Installation and Configuration

**Master Configuration** There is nothing to be done on the master node.

**Slave Configuration** First, install the bntools package:

```
apt-get install bntools
```

This will make the `bnfos` command available.

You can then connect your berofos to your network and power it on. By default, the berofos will try to get an IP address via DHCP. If it is not able to get such address from a DHCP server, it will take the 192.168.0.2/24 IP address.

---

**Note:** The DHCP server on XiVO does not offer IP addresses to berofos devices by default.

---

Next step is to create the `/etc/bnfos.conf` file via the following command:

```
bnfos --scan -x
```

If no berofos device is detected using this last command, you'll have to explicitly specify the IP address of the berofos via the `-h` option:

```
bnfos --scan -x -h <berofos ip>
```

At this stage, your `/etc/bnfos.conf` file should contains something like this:

```
[fos1]
mac = 00:19:32:00:12:1D
host = 10.34.1.50
#login = <user>:<password>
```

It is advised to configure your berofos with a static IP address. You first need to put your berofos into *flash mode* :

- press and hold the black button next to the power button,
- power on your berofos,
- release the black button when the red LEDs of port D start blinking.

Then, you can issue the following command, by first replacing the network configuration with your one:

```
bnfos --netconf -f fos1 -i 10.34.1.20 -n 255.255.255.0 -g 10.34.1.1 -d 0
```

---

**Note:**

- `-i` is the IP address
  - `-n` is the netmask
  - `-g` is the gateway
  - `-d 0` is to disable DHCP
- 

You can then update your berofos firmware to version 1.53:

```
wget http://www.beronet.com/downloads/berofos/bnfos_v153.bin
bnfos --flash bnfos_v153.bin -f fos1
```

Once this is done, you'll have to reboot your berofos in operationnal mode (that is in normal mode).

Then you must rewrite the `/etc/bnfos.conf` (mainly if you changed the IP address):

```
bnfos --scan -x -h <berofos ip>
```

Now that your berofos has proper network configuration and an up to date firmware, you might want to set a password on your berofos:

```
bnfos --set apwd=<password> -f fos1
bnfos --set pwd=1 -f fos1
```

You must then edit the `/etc/bnfos.conf` and replace the login line to something like:

```
login = admin:<password>
```

Next, configure your berofos for it to work correctly with the XiVO HA:

```
bnfos --set wdog=0 -f fos1
bnfos --set wdogdef=0 -f fos1
bnfos --set scenario=0 -f fos1
bnfos --set mode=1 -f fos1
bnfos --set modedef=1 -f fos1
```

This, among other things, disable the watchdog. The switching from one relay mode to the other will be done by the XiVO slave node once it detects the master node is down, and vice-versa.

Finally, you can make sure everything works fine by running the `xivo-berofos` command:

```
xivo-berofos master
```

The green LEDs on your berofos should be lighted on ports A and B.

## Connection

**Two XiVOs** Here's how to connect the ISDN lines between your berofos with:

- two XiVOs in high availability

In this configuration you can protect **up two 4** ISDN lines. If more than 4 ISDN lines to protect, you must set up a *Multiple berofos* configuration.

Here's an example with 4 ISDN lines coming from your telephony provider:

**Two XiVOs and one PBX** Here's how to connect your berofos with:

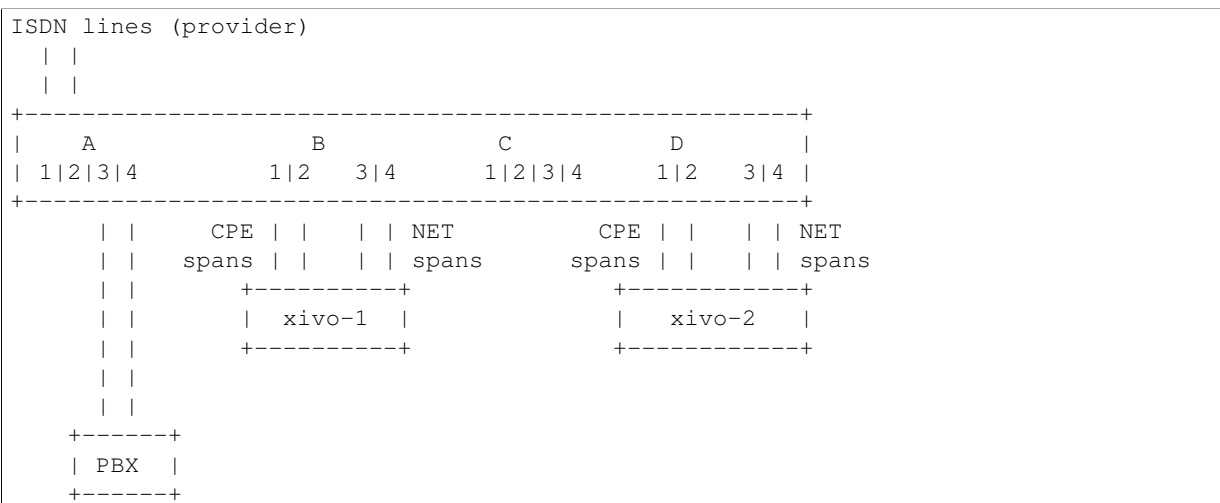

- two XiVOs in high availability,
- one PBX.

In this configuration you can protect **up two 2** ISDN lines. If more than 2 ISDN lines to protect, you must set up a *Multiple berofos* configuration.

Logical view:

This example shows the case where there are 2 ISDN lines coming from your telephony provider:

**One XiVO and one PBX** This case is not currently supported. You'll find a workaround in the *Berofos Integration with PBX* section.

**Multiple berofos** It's possible to use more than 1 berofos with XiVO.

For each supplementary berofos you want to use, you must first configure it properly like you did for the first one. The only difference is that you need to add a berofos declaration to the `/etc/bnfos.conf` file instead of creating/overwriting the file. Here's an example of a valid config file for 2 berofos:

```
[fos1]
mac = 00:19:32:00:12:1D
host = 10.100.0.201
login = admin:foobar

[fos2]
mac = 00:11:22:33:44:55
host = 10.100.0.202
login = admin:barfoo
```

**Warning:** berofos name must follow the pattern `fosX` where `X` is a number starting with 1, then 2, etc. The `bnfos` tool won't work properly if it's not the case.

## Operation

When your XiVO switch the relay mode of your berofos, it logs the event in the `/var/log/syslog` file.

## Default mode

Note that when the berofos is off, the A and D ports are connected together. This behavior is not customizable.

## Uninstallation

It is important to remove the `/etc/bnfos.conf` file on the slave node when you don't want to use anymore your berofos with your XiVOs.

## Reset the Berofos

You can reset the berofos configuration :

1. Power on the berofos,
2. When red and green LEDs are still lit, press & hold the black button,
3. Release it when the red LEDs of the D port start blinking fast
4. Reboot the beronet, it should have lost its configuration.

## External links

- [berofos user manual](#)

## 1.11 API and SDK

### 1.11.1 Channel Event Logging (CEL)

CELs are the mechanism used by Asterisk to store telephony events. XiVO uses CELs instead of CDRs since they are more accurate and flexible.

## Official Documentation

Asterisk's CEL documentation can be accessed online on the [Asterisk wiki](#).

## CEL Samples

The following configuration will be used for the following examples.

- User *Tux* with extension *1000*
- User *Père Noël* with extension *1001*
- External User with number *555-555-5555*
- External calls to DID *445* are sent to *1000*
- External calls to DID *446* are sent to *1001*
- Our DID number is *555-555-6666*

### Outgoing Call

1. *1000 calls 555-555-5555*
2. *555-555-5555 answers*
3. *555-555-5555 hangs-up* after a few seconds

## Userfield with CEL

The CEL table has a field named *userfield* which is used on outgoing calls when the caller has a userfield set in his configuration. The *userfield* can be enriched from the dialplan with context information.

To set the value of the field from the dialplan you have to use the asterisk function *CHANNEL(userfield)*, for example:

```
Set (CHANNEL(userfield))=${MY_DIALPLAN_VAR})
```

Note : for those who used the same *userfield* information in the CDR by calling the function *CDR(userfield)*, you have to replace it with the function *CHANNEL(userfield)*.

## 1.11.2 Message Bus

The message bus is used to receive events from XiVO. It is provided by an [AMQP 0-9-1](#) broker (namely, [RabbitMQ](#)) that is integrated in XiVO.

**Warning:** Interaction with the bus is presently experimental and some things might change in the next XiVO versions.

## Usage

At the moment, the AMQP broker only listens on the 127.0.0.1 address. This means that if you want to connect to the AMQP broker from a distant machine, you must modify the RabbitMQ server configuration, which is not yet an officially supported operation. All events are sent to the *xivo* exchange.

Otherwise, the default connection information is:

- Virtual host: /
- User name: guest
- User password: guest
- Port: 5672
- Exchange name: xivo
- Exchange type: topic

## Example

Here's an example of a simple client, in python, listening for the *call\_form\_result* CTI events:

```
import kombu

from kombu.mixins import ConsumerMixin

EXCHANGE = kombu.Exchange('xivo', type='topic')
ROUTING_KEY = 'call_form_result'

class C(ConsumerMixin):

    def __init__(self, connection):
        self.connection = connection

    def get_consumers(self, Consumer, channel):
        return [Consumer(kombu.Queue(exchange=EXCHANGE, routing_key=ROUTING_KEY),
                                callbacks=[self.on_message])]

    def on_message(self, body, message):
        print('Received:', body)
        message.ack()

def main():
    with kombu.Connection('amqp://guest:guest@localhost:5672//') as conn:
        try:
            C(conn).run()
        except KeyboardInterrupt:
            return

main()
```

If you are new to AMQP, you might want to look at the [RabbitMQ tutorial](#).

## Notes

Things to be aware when writing a client/consumer:

- The `xivo-service stop` command stops the AMQP broker. This means that the client connections to the AMQP broker will be lost on:
  - a XiVO upgrade
  - an asterisk crash
- The published messages are not persistent. When the AMQP broker stops, the messages that are still in queues will be lost.

## Events

Events that are sent to the bus use a JSON serialization format. For example, the CTI *call\_form\_result* event looks like this:

```
{ "name": "call_form_result",
  "origin_uuid": "ca7f87e9-c2c8-5fad-ba1b-c3140ebb9be3",
  "data": { ... } }
```

All events have the same basic structure, namely, a JSON object with three keys:

**name** A string representing the name of the event. Each event type has a unique name.

**origin\_uuid** The uuid to identify the message producer.

**data** The data specific part of the event. This is documented on a per event type; if not this is assumed to be null.

### AMI events

All AMI events are broadcasted on the bus.

- routing key: `ami.<event name>`
- event specific data: a dictionary with the content of the AMI event

Example event with binding key `QueueMemberStatus`:

```
{
  "name": "QueueMemberStatus",
  "origin_uuid": "ca7f87e9-c2c8-5fad-ba1b-c3140ebb9be3",
  "data": {
    "Status": "1",
    "Penalty": "0",
    "CallsTaken": "0",
    "Skills": "",
    "MemberName": "sip\/m3ylhs",
    "Queue": "petak",
    "LastCall": "0",
    "Membership": "static",
    "Location": "sip\/m3ylhs",
    "Privilege": "agent,all",
    "Paused": "0",
    "StateInterface": "sip\/m4ylhs"
  }
}
```

### call\_form\_result

The `call_form_result` event is sent when a *custom call form* is submitted by a CTI client.

- routing key: `call_form_result`
- event specific data: a dictionary with 2 keys:
  - `user_id`: an integer corresponding to the user ID of the client who saved the call form
  - `variables`: a dictionary holding the content of the form

Example:

```
{
  "name": "call_form_result",
  "origin_uuid": "ca7f87e9-c2c8-5fad-ba1b-c3140ebb9be3",
  "data": {
    "user_id": 40,
    "variables": {
      "firstname": "John",
      "lastname": "Doe"
    }
  }
}
```

### agent\_status\_update

The agent\_status\_update is sent when an agent is logged in or logged out.

- routing key: status.agent
- event specific data: a dictionary with 3 keys:
  - agent\_id: an integer corresponding to the agent ID of the agent who's status changed
  - status: a string identifying the status
  - xivo\_id: the uuid of the xivo

Example:

```
{
  "name": "agent_status_update",
  "origin_uuid": "ca7f87e9-c2c8-5fad-ba1b-c3140ebb9be3",
  "data": {
    "agent_id": 42,
    "xivo_id": "ca7f87e9-c2c8-5fad-ba1b-c3140ebb9be3",
    "status": "logged_in"
  }
}
```

### endpoint\_status\_update

The endpoint\_status\_update is sent when an end point status changes. This information is based on asterisk hints.

- routing key: status.endpoint
- event specific data: a dictionary with 3 keys
  - xivo\_id: the uuid of the xivo
  - endpoint\_id: an integer corresponding to the endpoint ID
  - status: an integer corresponding to the asterisk device state

Example:

```
{
  "name": "endpoint_status_update",
  "origin_uuid": "ca7f87e9-c2c8-5fad-ba1b-c3140ebb9be3",
  "data": {
    "endpoint_id": 67,
    "xivo_id": "ca7f87e9-c2c8-5fad-ba1b-c3140ebb9be3",
    "status": 0
  }
}
```

### user\_status\_update

The user\_status\_update is sent when a user changes his CTI presence using the XiVO client.

- routing key: status.user
- event specific data: a dictionary with 3 keys
  - xivo\_id: the uuid of the xivo
  - user\_id: an integer corresponding to the user ID of the user who changed its status
  - status: a string identifying the status

Example:

```
{
  "name": "user_status_update",
  "origin_uuid": "ca7f87e9-c2c8-5fad-ba1b-c3140ebb9be3",
  "data": {
    "user_id": 42,
    "xivo_id": "ca7f87e9-c2c8-5fad-ba1b-c3140ebb9be3",
    "status": "busy"
  }
}
```

### 1.11.3 Queue logs

Queue logs are events logged by Asterisk in the queue\_log table of the asterisk database. Queue logs are used to generate XiVO call center statistics.

#### Queue log sample

##### Agent callback login

time	callid	queuename	agent	event	
2012-07-03 15:27:23.896208	1341343640.4	NONE	Agent/3001	AGENTCALLBACKLOGIN	100

##### Agent callback logoff

Agent/3001 is logged in queues q1 and q2.

## 1.11.4 REST API

The XiVO REST API is the privileged way to programmatically interact with XiVO.

### Reference

#### XiVO confd API

**Note:** REST API 1.1 for confd is currently evolving. New features and small fixes are regularly being added over time. We invite the reader to periodically check the [changelog](#) for an update on new features and changes.

#### xivo-confd REST API changelog

##### 14.16

- Association [user-voicemail](#), when associating a voicemail whose id does not exist:
  - before: error 404
  - after: error 400

##### 14.14

- Association [line-extension](#), a same extension can not be associated to multiple lines

##### 14.13

- Resource [line](#), field `provisioning_extension`: type changed from `int` to `string`

## REST API 1.1 examples

## Create User for a line and a exten

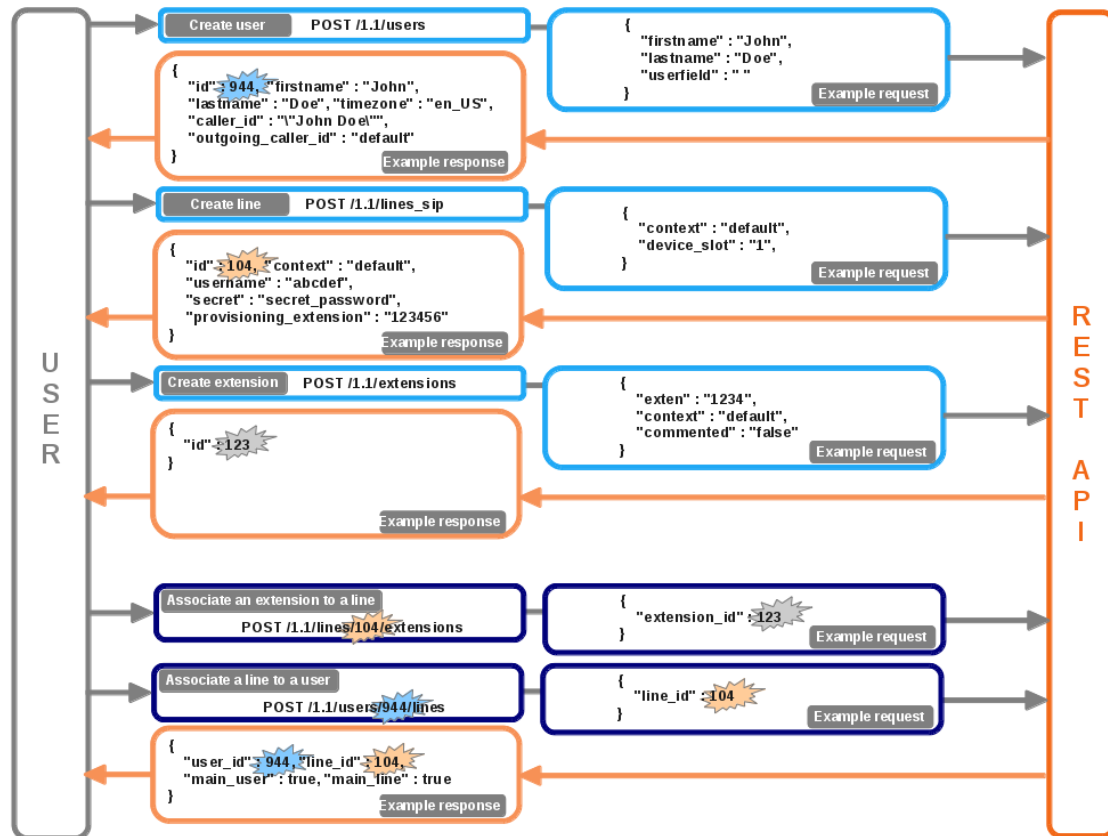

Fig. 1.93: Download source. (source)

## Add user, line and exten with association

## Add voicemail with association

## Choice and add CTI profile with association

## Multiple users for a line association

**Warning:** Some services are still being developed and can be changed without prior warning. Here is a list of services in BETA stage:

- Function Keys

## API reference

## Agent Queue Association

**Warning:** This service is experimental

Service for associating an agent with a queue.

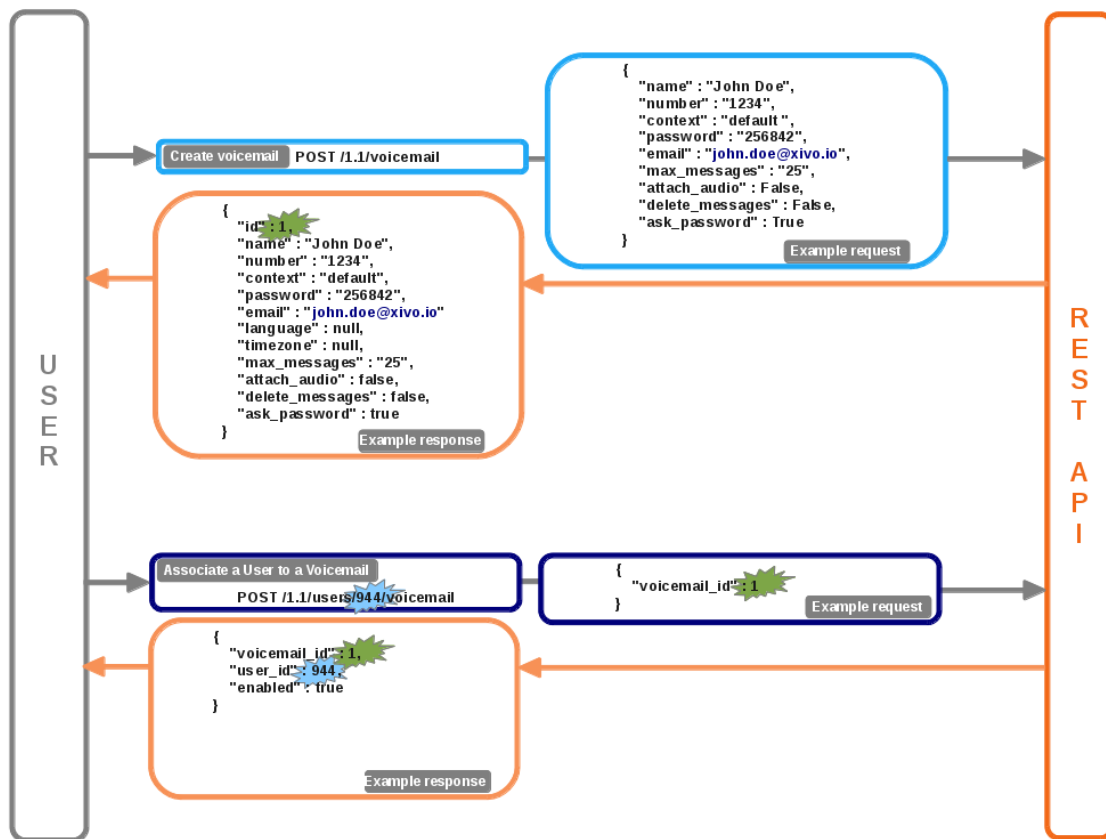

Fig. 1.94: Download source. (source)

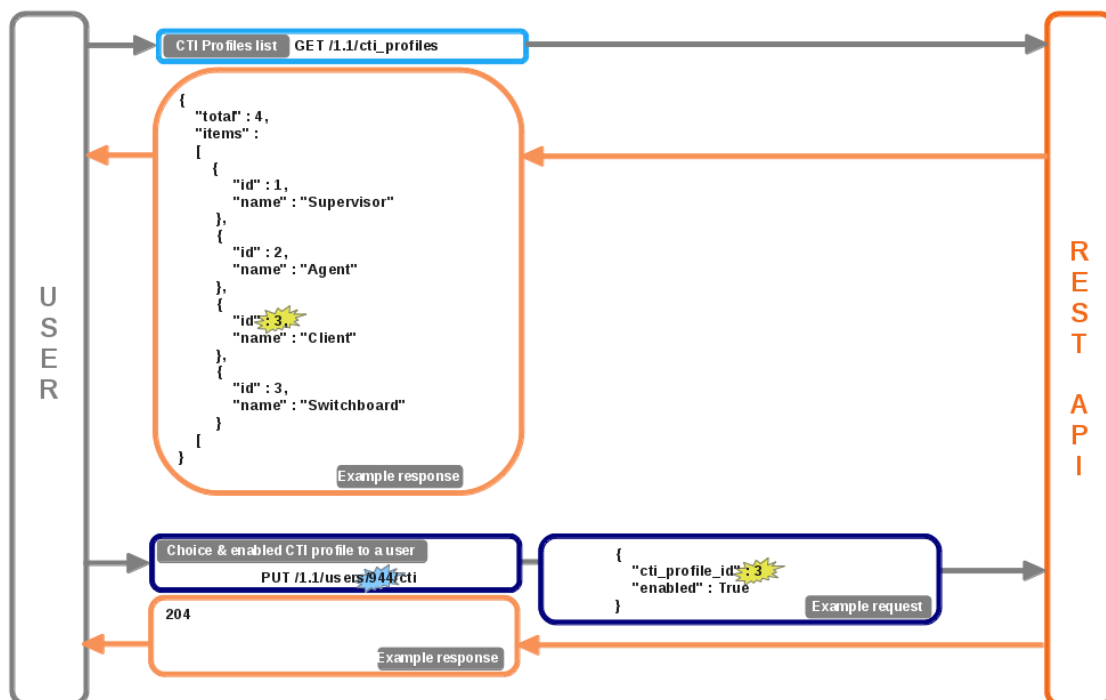

Fig. 1.95: Download source. (source)

Fig. 1.96: Download source. (source)

## Association Representation

Description	Field	Value	Description
	agent_id	int	Agent's ID
	queue_id	int	The Queue's id
	penalty	int	The penalty value

## Get an Agent - Queue association

### Query

```
GET /1.1/queues/<queue_id>/members/agents/<agent_id>
```

Errors	Error code	Error message	Description
	404	Resource Not Found - QueueMember was not found ('agent_id': <agent_id>, 'queue_id': <queue_id>)	
	404	Resource Not Found - Queue was not found ('queue_id': <queue_id>)	
	404	Resource Not Found - Agent was not found ('agent_id': <agent_id>)	

### Example request

```
GET /1.1/queues/3/members/agents/18
Host: xivoserver
```

### Example response

```
HTTP/1.1 200 OK
Content-Type: application/json

{
  "agent_id": 18,
  "queue_id": 3,
  "penalty": 5
}
```

**Associate an Agent to a Queue** Position in queue is set to max position + 1 or 0 if it is the first member of the queue

### Query

```
POST /1.1/queues/<queue_id>/members/agents
```

Input	Field	Required	Values	Description
	agent_id	yes	int	Must be an existing id
	penalty	yes	int	> 0

Errors	Error code	Error message	Description
	404	Resource Not Found - Queue was not found ('queue_id': <queue_id>)	
	400	Input Error - field 'agent_id': Agent was not found	
	400	Resource Error - Agent is associated with a Queue	

### Example request

```
POST /1.1/queues/3/members/agents
Host: xivoserver
Content-Type: application/json

{
  "agent_id" : 32,
  "penalty": 12
}
```

### Example response

```
HTTP/1.1 201
Location: /1.1/queues/3/members/agents/32

{
  "agent_id": 32,
  "queue_id": 3,
  "penalty": 12
}
```

## Remove Agent from a Queue

### Query

```
DELETE /1.1/queues/<queue_id>/members/agents/<agent_id>
```

Errors	Error code	Error message	Description
	404	Resource Not Found - QueueMember was not found ('agent_id': <agent_id>, 'queue_id': <queue_id>)	
	404	Resource Not Found - Queue was not found ('queue_id': <queue_id>)	
	404	Resource Not Found - Agent was not found ('agent_id': <agent_id>)	

### Example request

```
DELETE /1.1/queues/3/members/agents/18
Host: xivoserver
```

### Example response

```
HTTP/1.1 204 NO CONTENT
```

## Edit an Agent - Queue association

### Query

```
PUT /1.1/queues/<queue_id>/members/agents/<agent_id>
```

Errors	Error code	Error message	Description
	404	Resource Not Found - QueueMember was not found ('agent_id': <agent_id>, 'queue_id': <queue_id>)	
	404	Resource Not Found - Queue was not found ('queue_id': <queue_id>)	
	404	Resource Not Found - Agent was not found ('agent_id': <agent_id>)	

**Example request**

```
PUT /1.1/queues/3/members/agents/18
Host: xivoserver
Content-Type: application/json

{
  "penalty": 5
}
```

**Example response**

```
HTTP/1.1 204 OK
```

**Call Logs****Call Logs Representation**

Description	Field	Values	Description
	Call date	date	YYYY-MM-DDTHH:MM:SS
	Caller	string	
	Called	string	
	Period	integer	Number of seconds of the call. 0 if not answered
	user Field	string	

**Example**

```
Call Date,Caller,Called,Period,user Field
2013-01-02T00:00:00,source2 (1002),2002,2,userfield
```

**Format** Call logs are presented in CSV format, with the following specifications:

- field names are listed on the first line
- fields are separated by commas: ,
- if there is a comma in a field value, the value is surrounded by double quotes: "
- the CSV file uses the character encoding UTF-8

**List Call logs**

**Note:** Call logs are generated automatically, but not immediately. See [Call Logs](#).

**Query**

```
GET /1.1/call_logs
```

**Example request**

```
GET /1.1/call_logs HTTP/1.1
Host: xivoserver
Accept: text/csv
```

**Example response**

```
HTTP/1.1 200 OK
Content-Type: text/csv; charset=utf8

Call Date,Caller,Called,Period,user Field
2013-01-01T00:00:00,source1 (1001),2001,1,
2013-01-02T00:00:00,source2 (1002),2002,2,userfield
```

## Filtering by period

### Query

```
GET /1.1/call_logs?start_date=DATE&end_date=DATE
```

DATE must be in the following format: YYYY-MM-DDTHH:MM:SS. Note the T separating the date and time. start\_date and end\_date must be given together ; the REST API will not accept start\_date without end\_date and vice-versa.

### Example request

```
GET /1.1/call_logs?start_date=2013-01-01T00:12:34&end_date=2013-01-02T06:54:32 HTTP/1.1
Host: xivoserver
Accept: text/csv
```

### Example response

```
HTTP/1.1 200 OK
Content-Type: text/csv; charset=utf8

Call Date,Caller,Called,Period,user Field
2013-01-01T01:00:00,source1 (1001),2001,1,
2013-01-02T00:00:00,source2 (1002),2002,2,userfield
```

## Configuration

### Configuration parameters

Parameter	Values	Description
live_reload	bool	

### Get live reload status

### Query

```
GET /1.1/configuration/live_reload
```

### Example requests

```
GET /1.1/configuration/live_reload HTTP/1.1
Host: xivoserver
Accept: application/json
```

### Example response

```
HTTP/1.1 200 OK
Content-Type: application/json

{
  "enabled": true
  "links": [
```

```
{
  "rel": "configuration",
  "href": "https://xivosever/1.1/configuration/live_reload"
}
]
```

## Change live reload status

### Query

```
PUT /1.1/configuration/live_reload
```

### Example request

```
PUT /1.1/configuration/live_reload HTTP/1.1
Host: xivosever
Content-Type: application/json

{
  "enabled": false
}
```

### Example response

```
HTTP/1.1 204 No Content
```

## CTI Profiles

### CTI Profiles representation

Description	Field	Values	Description
	id	integer	Read-only
	name	string	Display name

### Example

```
{
  "id": 1,
  "name": "Client"
}
```

### CTI Profiles list

### Query

```
GET /1.1/cti_profiles
```

### Example requests Listing all available CTI profiles:

```
GET /1.1/cti_profiles HTTP/1.1
Host: xivosever
Accept: application/json
```

### **Example response**

```
HTTP/1.1 200 OK
Content-Type: application/json

{
  "total": 2,
  "items":
  [
    {
      "id": 1,
      "name": "Client"
    },
    {
      "id": 2,
      "name": "Agent"
    }
  ]
}
```

## **Get CTI Profile**

### **Query**

```
GET /1.1/cti_profiles/<id>
```

### **Example request**

```
GET /1.1/cti_profiles/1 HTTP/1.1
Host: xivoserver
Accept: application/json
```

### **Example response**

```
HTTP/1.1 200 OK
Content-Type: application/json

{
  "id": 1,
  "name": "Client"
}
```

## **Devices**

### **Device Representation**

<b>Description</b>	Field	Values	Description
	id	string	(Read-only)
	ip	string formatted as an IP address (10.0.0.0)	IP address
	mac	string formatted as a MAC address (aa:bb:cc:dd:ee:ff)	MAC address
	sn	string	Serial number
	vendor	string	Vendor name
	model	string	Device model
	version	string	Firmware version
	plugin	string	Provisioning plugin to be used by the device
	description	string	
	status	<ul style="list-style-type: none"> <li>• configured</li> <li>• autoprov</li> <li>• not_configured</li> </ul>	<ul style="list-style-type: none"> <li>• configured: Device is configured and ready to be used</li> <li>• autoprov : Device can be provisionned using a provisioning code</li> <li>• not_configured : Device has not been completely configured</li> </ul>
	options	object	List of standard keys: <ul style="list-style-type: none"> <li>• switchboard : a boolean indicating if this device is a switchboard</li> </ul>
	template_id	string	ID of the device template. All devices using a device template will have a certain number of common parameters preconfigured for the device

**Example**

```
{
  "id": "412c212cff500cc158f373ff00e078f7",
  "ip": "10.0.0.1",
  "mac": "00:00:5e:00:00:01",
  "sn": null,
  "vendor": "Aastra",
  "model": "6757i",
  "version": "3.2.2",
  "plugin": "xivo-aastra-3.2.2-SP3",
  "description": null,
  "status": "configured",
  "options": {"switchboard": true},
  "template_id": "defaultconfigdevice",
  "links" : [
    {
      "rel": "devices",
      "href": "https://xivosever/1.1/devices/412c212cff500cc158f373ff00e078f7"
    }
  ]
}
```

**Device list**

## Query

```
GET /1.1/devices
```

## Parameters

**order** Sort devices using the specified field (e.g. “mac”). Allowed fields: ip, mac, plugin, model, vendor, version.

**direction** ‘asc’ or ‘desc’. Sort list in ascending (asc) or descending (desc) order

**limit** total number of devices to show in the list

**skip** number of devices to skip over before starting the list

**search** Search devices. Only devices with a field containing the search term will be listed.

	Error code	Error message	Description
<b>Errors</b>	400	Invalid parameters: limit must be a positive number	the ‘limit’ parameter must be a number
	400	Invalid parameters: skip must be a positive number	the ‘skip’ parameter must be a number
	400	Invalid parameters: ordering parameter ‘<field>’ does not exist	you must use one of the fields available in a device when sorting a list
	400	Invalid parameters: direction parameter ‘<direction>’ does not exist	use either ‘asc’ or ‘desc’ as a direction when sorting a list

**Example requests** List all devices:

```
GET /1.1/devices HTTP/1.1
Host: xivoserver
Accept: application/json
```

List 10 devices, sorted by mac address:

```
GET /1.1/devices?limit=10&order=mac HTTP/1.1
Host: xivoserver
Accept: application/json
```

Search for devices containing the term “aastra”:

```
GET /1.1/devices?search=aastra HTTP/1.1
Host: xivoserver
Accept: application/json
```

## Example response

```
HTTP/1.1 200 OK
Content-Type: application/json

{
  "total": 2,
  "items": [
    {
      "id": "412c212cff500cc158f373ff00e078f7",
      "ip": "10.0.0.1",
      "mac": "00:00:5e:00:00:01",
      "sn": null,
      "vendor": "Aastra",
      "model": "6731i",
      "version": "3.2.2",
      "plugin": "xivo-aastra-3.2.2-SP3"
```

```

        "description": null,
        "status": "configured",
        "options": null,
        "template_id": "defaultconfigdevice",
        "links" : [
            {

                "href": "https://xivoserver/1.1/devices/412c212cff500cc158f373ff00e078f7"
            }
        ]
    },
    {
        "id": "6ff76e09a7ab51ec3afe152a63324ff9",
        "ip": "10.0.0.2",
        "mac": "00:00:5e:00:00:02",
        "sn": null,
        "vendor": "Snom",
        "model": "720",
        "version": "8.7.3.19",
        "plugin": "xivo-snom-8.7.3.19",
        "description": null,
        "status": "configured",
        "options": null,
        "template_id": "defaultconfigdevice",
        "links" : [
            {
                "rel": "devices",
                "href": "https://xivoserver/1.1/devices/6ff76e09a7ab51ec3afe152a63324ff9"
            }
        ]
    }
]
}

```

## Get Device

### Query

```
GET /1.1/devices/<id>
```

### Parameters

**id** Device's id

### Errors

Error code	Error message	Description
404	Not found	The requested device was not found

### Example request

```

GET /1.1/devices/412c212cff500cc158f373ff00e078f7 HTTP/1.1
Host: xivoserver
Accept: application/json

```

### Example response

```

HTTP/1.1 200 OK
Content-Type: application/json

{

```

```
{
  "id": "412c212cff500cc158f373ff00e078f7",
  "ip": "10.0.0.1",
  "mac": "00:00:5e:00:00:01",
  "sn": null,
  "vendor": "Aastra",
  "model": "6731i",
  "version": "3.2.2",
  "plugin": "xivo-aastra-3.2.2-SP3"
  "description": null,
  "status": "configured",
  "options": null,
  "template_id": "defaultconfigdevice",
  "links" : [
    {
      "rel": "devices",
      "href": "https://xivoserver/1.1/devices/412c212cff500cc158f373ff00e078f7"
    }
  ]
}
```

## Create a Device

### Query

```
POST /1.1/devices
```

Input	Field	Required	Values	Description
	ip	no	string	(see above)
	mac	no	string	(see above)
	sn	no	string	(see above)
	vendor	no	string	(see above)
	model	no	string	(see above)
	version	no	string	(see above)
	description	no	string	(see above)
	options	no	object	(see above)
	template_id	no	string	(see above)

Errors	Error code	Error message	Description
	400	error while creating Device: <explanation>	See explanation for more details
	400	Invalid parameters: ip	ip address is not formatted correctly
	400	Invalid parameters: mac	mac address is not formatted correctly
	400	Invalid parameters: options	options is not an object
	400	Invalid parameters: options.switchboard	switchboard option is not a boolean
	400	device <mac> already exists	a device using the same MAC address has already been created
	400	Nonexistent parameters: plugin <plugin> does not exist	the selected plugin does not exist or has not been installed
	400	Nonexistent parameters: template_id <template_id> does not exist	the selected device template does not exist

### Example request

```
POST /1.1/devices HTTP/1.1
Host: xivoserver
Accept: application/json
Content-Type: application/json
```

```
{
  "ip": "10.0.0.1",
  "mac": "00:00:5e:00:00:01",
  "vendor": "Aastra",
  "model": "6731i",
  "version": "3.2.2",
  "plugin": "xivo-aastra-3.2.2-SP3"
  "template_id": "defaultconfigdevice",
}
```

### Example response

```
HTTP/1.1 201 Created
Location: /1.1/devices/412c212cff500cc158f373ff00e078f7
Content-Type: application/json

{
  "id": "412c212cff500cc158f373ff00e078f7",
  "ip": "10.0.0.1",
  "mac": "00:00:5e:00:00:01",
  "sn": null,
  "vendor": "Aastra",
  "model": "6731i",
  "version": "3.2.2",
  "description": null,
  "status": "configured",
  "plugin": "xivo-aastra-3.2.2-SP3"
  "options": null,
  "template_id": "defaultconfigdevice",
  "links" : [
    {
      "rel": "devices",
      "href": "https://xivoserver/1.1/devices/412c212cff500cc158f373ff00e078f7"
    }
  ]
}
```

## Update a Device

### Query

```
PUT /1.1/devices/<id>
```

The update does not need to set all the fields for the device. Only the fields that need to be updated must be set.

### Parameters

**id** Device's id

**Input** Same as for creating a device. Please see [Create a Device](#)

**Errors** Same as for creating a device. Please see [Create a Device](#)

### Example request

```
PUT /1.1/devices/42 HTTP/1.1
Host: xivoserver
Content-Type: application/json
```

```
{
  "ip": "10.0.0.1"
}
```

### Example response

```
HTTP/1.1 204 No Content
```

**Delete a Device** A device can not be deleted if it is linked to a line. You must deassociate the line and the device first.

### Query

```
DELETE /1.1/devices/<id>
```

Errors	Error code	Error message	Description
	400	error while deleting Device: <explanation>	See error message for more details
	404	Not found	The requested device was not found

### Example request

```
DELETE /1.1/devices/412c212cff500cc158f373ff00e078f7 HTTP/1.1
Host: xivoserver
```

### Example response

```
HTTP/1.1 204 No Content
```

### Reset a device to autoprov

**Warning:** The device's configuration will be lost when reset to autoprov mode.

Resets a device into 'autoprov' mode. Once in autoprov, a device can be reprovisionned using another provisioning code.

### Query

```
GET /1.1/devices/<id>/autoprov
```

### Parameters

**id** Device's id

### Example request

```
GET /1.1/devices/412c212cff500cc158f373ff00e078f7/autoprov
Host: xivoserver
```

### Example response

```
HTTP/1.1 204 No Content
```

**Synchronize a device** Synchronize a device's configuration. Used when a configuration has been modified and the changes need to be sent to the device.

### Query

```
GET /1.1/devices/<id>/synchronize
```

### Parameters

**id** Device's id

### Example request

```
GET /1.1/devices/412c212cff500cc158f373ff00e078f7/synchronize
Host: xivoserver
```

### Example response

```
HTTP/1.1 204 No Content
```

### Associate a line to a device

**Warning:** This feature is not yet accessible nor functional.

After associating a line, the device needs to be synchronized for the changes to take effect. Please see [Synchronize a device](#)

### Query

```
GET /1.1/devices/<id>/associate_line/<lineid>
```

### Parameters

**id** Device's id

**line\_id** Line id

### Example request

```
GET /1.1/devices/412c212cff500cc158f373ff00e078f7/associate_line/2
Host: xivoserver
```

### Example response

```
HTTP/1.1 204 No Content
```

### Remove a line from a device

**Warning:** This feature is not yet accessible nor functional.

After removing a line, the device needs to be synchronized for the changes to take effect. Please see [Synchronize a device](#)

### Query

```
GET /1.1/devices/<id>/remove_line/<lineid>
```

### Parameters

**id** Device's id

**line\_id** Line id

### Example request

```
GET /1.1/devices/412c212cff500cc158f373ff00e078f7/remove_line/2
Host: xivoserver
```

### Example response

```
HTTP/1.1 204 No Content
```

**Extensions** An extension represents a number that can be dialed on a phone. Once an extension is created, it can be associated with different kinds of resources. These associations determine where a call will be routed when the extension is dialed.

An extension is composed of an “exten” (the number to dial) and a “context” (from where are we allowed to dial). The context restrains what source a call will come in from. (e.g. DID calls will come from the context “from-extern”)

### Extension Representation

Description	Field	Values	Description
	id	int	Read-only
	exten	string	
	context	string	
	commented	boolean	If True the extension is disabled
	links	list	The link to the resource

### Example

```
{
  "id": 1,
  "context": "default",
  "exten": "1234",
  "commented": false,
  "links" : [
    {
      "rel": "extensions",
      "href": "https://xivoserver/1.1/extensions/1"
    }
  ]
}
```

### Extension list

#### Query

```
GET /1.1/extensions
```

#### Parameters

**order** Sort the list using a column (e.g. “exten”). Columns allowed: exten, context.

**direction** ‘asc’ or ‘desc’. Sort list in ascending (asc) or descending (desc) order.

**limit** maximum number of items to return in the list. Must be a positive integer.

**skip** number of extensions to skip over before starting the list. Must be a positive integer.

**search** Search term. Only extensions with a field containing the search term will be listed.

**type** Only show extensions of a certain type. Types allowed: internal, incall

**Example requests** List all available extensions:

```
GET /1.1/extensions HTTP/1.1
Host: xivoserver
Accept: application/json
```

## List extensions sorted by exten in descending order:

```
GET /1.1/extensions?order=exten&direction=desc HTTP/1.1
Host: xivoserver
Accept: application/json
```

## List only the first 10 extensions having the number “17” in the exten:

```
GET /1.1/extensions?limit=10&search=17 HTTP/1.1
Host: xivoserver
Accept: application/json
```

## List extensions of type incall:

```
GET /1.1/extensions?type=incall HTTP/1.1
Host: xivoserver
Accept: application/json
```

**Example response**

```
HTTP/1.1 200 OK
Content-Type: application/json

{
  "total": 2,
  "items": [
    {
      "id": 1,
      "context": "default",
      "exten": "1234",
      "commented": false,
      "links" : [
        {
          "rel": "extensions",
          "href": "https://xivoserver/1.1/extensions/1"
        }
      ]
    },
    {
      "id": 2,
      "context": "default",
      "exten": "6789",
      "commented": true,
      "links" : [
        {
          "rel": "extensions",
          "href": "https://xivoserver/1.1/extensions/2"
        }
      ]
    }
  ]
}
```

**Get Extension****Query**

```
GET /1.1/extensions/<id>
```

### Example request

```
GET /1.1/extensions/1 HTTP/1.1
Host: xivoserver
Accept: application/json
```

### Example response

```
HTTP/1.1 200 OK
Content-Type: application/json

{
  "id": 1,
  "context": "default",
  "exten": "1234",
  "commented": false
}
```

**Create Extension** The extension number must be included in one of the extension ranges for the given context.

### Query

```
POST /1.1/extensions
```

Input	Field	Required	Values	Description
	exten	yes	string	
	context	yes	string	
	commented	no	boolean	If True the extension is disabled.

Errors	Error code	Error message	Description
	400	exten <number> not inside range of context <context>	
	400	error while creating Extension: <explanation>	See error message for more details

### Example request

```
POST /1.1/extensions HTTP/1.1
Host: xivoserver
Accept: application/json
Content-Type: application/json

{
  "exten": "1234",
  "context": "default",
  "commented": false
}
```

### Example response

```
HTTP/1.1 201 Created
Location: /1.1/extensions/1
Content-Type: application/json

{
  "id": 1,
  "links" : [
    {
```

```

        "rel": "extensions",
        "href": "https://xivosever/1.1/extensions/1"
    }
}

```

**Update an Extension** The update does not need to set all the fields of the edited extension. The update only needs to set the modified fields. The new extension number must be included in one of the extension ranges for the new context.

### Query

```
PUT /1.1/extensions/<id>
```

Errors	Error code	Error message	Description
	400	error while editing Extension: <explanation>	See error message for more details
	400	exten <number> not inside range of <context>	
	404	Not found	The requested extension was not found

### Example request

```

PUT /1.1/extensions/42 HTTP/1.1
Host: xivosever
Content-Type: application/json

{
    "context": "my_context"
}

```

### Example response

```
HTTP/1.1 204 No Content
```

**Delete Extension** An extension can not be deleted if it is associated to a line. You must delete the association first. Consult the documentation on [Line Extension Associations](#) for further details.

### Query

```
DELETE /1.1/extensions/<id>
```

Errors	Error code	Error message	Description
	400	error while deleting Extension: <explanation>	See error message for more details
	400	Error while deleting Extension: extension still has a link	See explanation above
	404	Not found	The requested extension was not found

### Example request

```

DELETE /1.1/extensions/1 HTTP/1.1
Host: xivosever

```

### Example response

```
HTTP/1.1 204 No Content
```

**Line-Extension Association** See *Line Extension Associations*.

**Function Keys** Function keys can be used as shortcuts for dialing a number, or accomplishing other menial tasks, by pushing a button on the phone. A function key's action is determined by its destination.

Function keys can be added directly on a user, or in a template. Templates are useful for creating a set of common function keys that can be used by the same group of people.

This page only describes the data models used by the REST API. Consult the [API documentation](#) for further details on URLs.

### Function Key Template

Parameters	Field	Type	Re- quired	Description
	name	string	No	A name for the template.
	keys	<i>Function Key</i>	No	A collection of function keys under the form {"position": "funckey"}. See the example for more details.

### Example

```
{
  "name": "Example template",
  "keys": {
    "1": {
      "destination": {
        "type": "user",
        "user_id": 34
      }
    },
    "2": {
      "blf": true,
      "label": "Call mom",
      "destination": {
        "type": "custom",
        "exten": "5551234567"
      }
    }
  }
}
```

### Function Key

Description	Field	Type	Required	Description
	blf	boolean	No	Turn on BLF when there is activity on the destination
	label	string	No	Label to display next to the function key
	destination	<i>Destination</i>	Yes	Destination to call

### Example

```
{
  "blf": True,
  "label": "Call john",
  "destination": {
    "type": "user",
    "user_id": 34
  }
}
```

**Destination** A destination determines the number to dial when using a function key. Destinations are composed of a parameter named `type` and any additional parameters required by its type.

Available destination types:

**agent** An agent

**bsfilter** Boss/Secretary filter

**conference** Conference room

**custom** A custom number to dial

**forward** Forward a call towards another number

**group** A group

**onlinerec** Record a conversation during a call

**paging** A paging

**park** Park a call

**park\_position** Pick up a parked call

**queue** Call queue

**service** A call service

**transfer** Transfer a call

**user** A User

Here are the parameters required for each destination:

<b>Agent</b>	Field	Type	Value
	agent_id	numeric	Agents's id

<b>BSFilter</b>	Field	Type	Value
	filter_member_id	numeric	ID of the filter member

<b>Conference</b>	Field	Type	Value
	conference_id	numeric	Conference's id

<b>Custom</b>	Field	Type	Value
	exten	string	Number to dial

<b>Forward</b>	Field	Type	Value
	forward	string	Type of forward. Possible values: busy, noanswer, unconditional
	exten	string	Number to dial (optional)

<b>Group</b>	Field	Type	Value
	group_id	numeric	Group's id

**Online call recording** No parameters are required for this destination

<b>Paging</b>	Field	Type	Value
	paging_id	numeric	Pagings's id

**Parking** No parameters are required for this destination

Parking Position	Field	Type	Value
	park_position	numeric string	Position of the parking to pick up

Queue	Field	Type	Value
	queue_id	numeric	User's id

Service	Field	Type	Value
	service	string	Name of the service

Currently supported services:

**phonestatus** Phone Status

**recsnd** Sound Recording

**callrecord** Call recording

**incallfilter** Incoming call filtering

**enablednd** Enable “Do not disturb” mode

**pickup** Group Interception

**calllistening** Listen to online calls

**directoryaccess** Directory access

**fwdundoall** Disable all forwarding

**enablevm** Enable Voicemail

**vmusermsg** Consult the Voicemail

**vmuserpurge** Delete messages from voicemail

Transfer	Field	Type	Value
	transfer	string	Type of transfer. Possible values: blind, attended

User	Field	Type	Value
	user_id	numeric	User's id

**Lines** The resource `/lines/` only provides read operations. Modifications can only be done on protocol-specific lines (see below).

## Generic Lines

### Line Representation Description

Field	Values	Description
id	int	Read-only
context	string	The name of an internal context
name	string	The name of the line
protocol	string, only value: sip	Read-only
provisioning_extension	string	Code used to provision a device
device_slot	int	line's position on the device
device_id	string	ID of the device associated to the line
links	list	The links to the resource

**SIP example**

```
{
  "id": 1,
  "context": "default",
  "name": "alb2c4",
  "protocol": "sip",
  "provisioning_extension": "342395",
  "device_slot": 1,
  "device_id": "2b63136208fb117335ce874e65eba2a3",
  "links" : [
    {
      "rel": "lines_sip",
      "href": "https://xivoserver/1.1/lines_sip/1"
    }
  ]
}
```

**Custom example**

**Warning:** Not yet implemented

```
{
  "id": 2,
  "context": "default",
  "name": "custom",
  "protocol": "custom",
  "provisioning_extension": "438111",
  "device_slot": 2,
  "links" : [
    {
      "rel": "lines_custom",
      "href": "https://xivoserver/1.1/lines_custom/2"
    }
  ]
}
```

**SCCP example**

**Warning:** Not yet implemented

```
{
  "id": 3,
  "context": "default",
  "name": "SCCP/1234",
  "protocol": "sccp",
  "provisioning_extension": "382731",
  "device_slot": 1,
  "links" : [
    {
      "rel": "lines_sccp",
      "href": "https://xivoserver/1.1/lines_sccp/3"
    }
  ]
}
```

**List Lines Query:**

```
GET /1.1/lines
```

**Example request:**

```
GET /1.1/lines HTTP/1.1
Host: xivoserver
Accept: application/json
```

**Example response:**

```
HTTP/1.1 200 OK
Content-Type: application/json

{
  "total": 3,
  "items": [
    {
      "id": 1,
      "context": "default",
      "name": "alb2c4",
      "protocol": "sip",
      "provisioning_extension": "342395",
      "device_slot": 1,
      "device_id": "2b63136208fb117335ce874e65eba2a3",
      "links" : [
        {
          "rel": "lines_sip",
          "href": "https://xivoserver/1.1/lines_sip/1"
        }
      ]
    },
    {
      "id": 2,
      "context": "default",
      "name": "custom",
      "protocol": "custom",
      "provisioning_extension": "438111",
      "device_slot": 2,
      "device_id": "4c63136208fb117g35ce874e6eeba25e",
      "links" : [
        {
          "rel": "lines_custom",
          "href": "https://xivoserver/1.1/lines_custom/2"
        }
      ]
    },
    {
      "id": 3,
      "context": "default",
      "name": "SCCP/1234",
      "protocol": "sccp",
      "provisioning_extension": "382731",
      "device_slot": 1,
      "device_id": "3s631t620gfb717835ce8a4e6efba85g",
      "links" : [
        {
          "rel": "lines_sccp",
          "href": "https://xivoserver/1.1/lines_sccp/3"
        }
      ]
    }
  ]
}
```

**Get Line Query:**

```
GET /1.1/lines/<line_id>
```

**Example request:**

```
GET /1.1/lines/42 HTTP/1.1
Host: xivoserver
Accept: application/json
```

**Example response:**

```
HTTP/1.1 200 OK
Content-Type: application/json

{
  "id": 42,
  "context": "default",
  "name": "alb2c4",
  "protocol": "sip",
  "provisioning_extension": "342395",
  "device_slot": 1,
  "device_id": "2b63136208fb117335ce874e65eba2a3",
  "links" : [
    {
      "rel": "lines_sip",
      "href": "https://xivoserver/1.1/lines_sip/42"
    }
  ]
}
```

**SIP Lines****SIP Line Representation    Description**

Field	Value	Description
id	int	Read-only
callerid	string	Caller id that appears on a phone when calling. Formatted as "Firstname Lastname" <number>
context	string	Context used to emit a call
device_slot	int	Line's position on the device
provisioning_extension	string	Numeric code used to provision a phone
secret	string	SIP account password
username	string	SIP account username
links	list	The link to the resource

**Warning:** Caller id will be overwritten when updating the name of a user associated to a line

**List SIP Lines    Query:**

```
GET /1.1/lines_sip
```

**Example request:**

```
GET /1.1/lines_sip HTTP/1.1
Host: xivoserver
Accept: application/json
```

**Example response:**

```

HTTP/1.1 200 OK
Content-Type: application/json

{
  "total": 2,
  "items": [
    {
      "id": 1,
      "context": "default",
      "username": "abcdef",
      "secret": "secret_password",
      "provisioning_extension": "123456",
      "device_slot": 1,
      "callerid": "\"John Doe\" <1002>",
      "links" : [
        {
          "rel": "lines_sip",
          "href": "https://xivoserver/1.1/lines_sip/1"
        }
      ]
    },
    {
      "id": 2,
      "context": "default",
      "username": "stuvwx",
      "secret": "super_secret_password",
      "provisioning_extension": "987456",
      "device_slot": 1,
      "callerid": "\"Mary Lin\" <1003>",
      "links" : [
        {
          "rel": "lines_sip",
          "href": "https://xivoserver/1.1/lines_sip/2"
        }
      ]
    }
  ]
}

```

### Get SIP Line Query:

```
GET /1.1/lines_sip/<id>
```

### Example request:

```

GET /1.1/lines_sip/1 HTTP/1.1
Host: xivoserver
Accept: application/json

```

### Example response:

```

HTTP/1.1 200 OK
Content-Type: application/json

{
  "id": 1,
  "context": "default",
  "username": "abcdef",
  "secret": "secret_password",
  "provisioning_extension": "123456",
  "device_slot": 1,
  "callerid": "\"John Doe\" <1002>",

```

```

    "links": [
      {
        "rel": "lines_sip",
        "href": "https://xivoserver/1.1/lines_sip/1"
      }
    ]
  }
}

```

**Create SIP Line Query:**

```
POST /1.1/lines_sip
```

**Input**

Field	Re-quired	Description
callerid	no	Caller id that appears on a phone when calling. String must be formatted as "Firstname Lastname" <number> (including quotes). Default: null
context	yes	Context used to emit a call
device_slot	yes	Line's position on the device
provisioning_extension	no	Numeric code used to provision a phone. Default: autogenerated
secret	no	SIP account password. Default: autogenerated
username	no	SIP account username. Default: autogenerated

**Errors**

Error code	Error message	Description
400	error while creating Line: <explanation>	See explanation for more details
400	Invalid parameters: context <context> does not exist	
400	Invalid parameters: device_slot must be numeric	Use a positive number for the device slot

**Example request:**

```

POST /1.1/lines_sip HTTP/1.1
Host: xivoserver
Accept: application/json
Content-Type: application/json

{
  "context": "default"
  "device_slot": 1
}

```

**Example response:**

```

HTTP/1.1 201 Created
Location: /1.1/lines_sip/1
Content-Type: application/json

{
  "id": 1,
  "context": "default",
  "username": "abcdef",
  "secret": "secret_password",
  "provisioning_extension": "123456",
  "device_slot": 1,
  "callerid": null,
  "links" : [
    {
      "rel": "lines_sip",

```

```

        "href": "https://xivosever/1.1/lines_sip/1"
    }
}

```

**Update a SIP Line** Only fields that need to be updated should be sent. All other fields will remain unmodified during the update.

**Query:**

```
PUT /1.1/lines_sip/<id>
```

### Errors

Same as for creating a SIP line. Please see [Create SIP line](#)

**Example request:**

```

PUT /1.1/lines_sip/67 HTTP/1.1
Host: xivosever
Content-Type: application/json

{
    "context": "my_context"
}

```

**Example response:**

```
HTTP/1.1 204 No Content
```

**Delete SIP Line** A SIP line can not be deleted if it is still associated with a user, an extension, or a device. Any user, extension, or device attached to the line must be dissociated first. Consult the documentation on [User Line Association](#), [Line Extension Associations](#) and [Devices](#) for further explanations.

**Query:**

```
DELETE /1.1/lines_sip/<id>
```

### Errors

Error code	Error message	Description
400	error while deleting Line: <explanation>	See error message for more details
400	Error while deleting Line: line still has a link	Line is still associated to a user, extension, or device (see explanation above)
404	Line with line_id=X does not exist	The requested line was not found

**Example request:**

```

DELETE /1.1/lines_sip/1 HTTP/1.1
Host: xivosever

```

**Example response:**

```
HTTP/1.1 204 No Content
```

**User-Line Association** See [User Line Association](#)

**Line-Extension Association** See [Line Extension Associations](#).

**Line Extension Associations** Connects an extension with a line, allowing the line to be called by dialing a number. A line can be associated with one or more extensions. The context of an extension determines from what source a call can arrive

Currently, this service only supports extensions inside the following context types:

**internal** Used for calling a line with an internal number (e.g. “1000@default”)

**incall** Used for calling a line from the outside (e.g. “from-extern” with a DID)

Association Representation	Field	Value	Description
	line_id	int	Line’s ID.
	extension_id	int	Extension’s ID.

### Get the Extension associated to a Line

#### Query

```
GET /lines/<line_id>/extensions
```

Errors	Error code	Error message	Description
	404	Line with id=<line_id> does not exist	

#### Example Request

```
GET /lines/34/extensions
Host: xivoserver
Accept: application/json
```

#### Example Response

```
HTTP/1.1 200 OK
Content-Type: application/json

{
  "total": 2,
  "items": [
    {
      "line_id": 34,
      "extension_id": 12,
      "links": [
        {
          "rel": "lines",
          "href": "https://xivoserver/1.1/lines/34"
        },
        {
          "rel": "extensions",
          "href": "https://xivoserver/1.1/extensions/12"
        }
      ]
    },
    {
      "line_id": 34,
      "extension_id": 13,
      "links": [
        {
          "rel": "lines",
          "href": "https://xivoserver/1.1/lines/34"
        }
      ]
    }
  ]
}
```

```
{
  {
    "rel": "extensions",
    "href": "https://xivosever/1.1/extensions/13"
  }
}
]
```

## Get the Line associated to an Extension

### Query

```
GET /extensions/<extension_id>/line
```

Errors	Error code	Error message	Description
	404	Extension with id=<extension_id> does not exist	

### Example Request

```
GET /extensions/48/line
Host: xivosever
Accept: application/json
```

### Example Response

```
HTTP/1.1 200 OK
Content-Type: application/json

{
  "line_id": 34,
  "extension_id": 48,
  "links": [
    {
      "rel": "lines",
      "href": "https://xivosever/1.1/lines/34"
    },
    {
      "rel": "extensions",
      "href": "https://xivosever/1.1/extensions/48"
    }
  ]
}
```

## Associate an Extension to a Line

**Note:** Because of technical limitations, a line can only have a single ‘internal’ extension associated (i.e. an extension with a context of type ‘internal’)

---

### Query

```
POST /lines/<line_id>/extensions
```

Input	Field	Required	Values	Description
	extension_id	yes	int	Must be an existing id

Errors	Error code	Error message	Description
	404	Line with id=<line_id> does not exist	
	400	Invalid parameters: line with id <line_id> already has an extension with a context of type 'internal'	Only one extension with a context of type 'internal' can be associated to a line
	400	Invalid parameters: extension is associated to a line	An extension can be associated to only one line

**Example request**

```
POST /1.1/lines/75/extensions
Host: xivoserver
Content-Type: application/json

{
  "extension_id": 46
}
```

**Example response**

```
HTTP/1.1 201
Location: /1.1/lines/75/extension

{
  "total": 1,
  "items":
  [
    {
      "line_id": 75,
      "extension_id": 46,
      "links": [
        {
          "rel": "lines",
          "href": "https://xivoserver/1.1/lines/75"
        },
        {
          "rel": "extensions",
          "href": "https://xivoserver/1.1/extensions/46"
        }
      ]
    }
  ]
}
```

**Dissociate an Extension from a Line** Any devices that are attached to a line must be removed before dissociating an extension from its line. A device can be dissociated by resetting it to autoprov mode. Consult the documentation on [Devices](#) for further details.

**Query**

```
DELETE /1.1/lines/<line_id>/extensions/<extension_id>
```

Errors	Error code	Error message	Description
	404	Line with id=<line_id> does not exist	
	404	Extension with id=<extension_id> does not exist	
	400	Invalid parameters: A device is still associated to the line	

### Example request

```
DELETE /1.1/lines/32/extensions/16
Host: xivoserver
```

### Example response

```
HTTP/1.1 204 No Content
```

### Line Extension Association

**Warning:** This service is **DEPRECATED**. Please use *Line Extension Associations* instead.

### Association Representation

Description	Field	Value	Description
	line_id	int	Line's ID. Read-only.
	extension_id	int	Extension's ID.

### Get the Extension associated to a Line

#### Query

```
GET /lines/<line_id>/extension
```

Errors	Error code	Error message	Description
	404	Line with id=<line_id> does not exist	
	404	Line with id=<line_id> does not have an extension	

### Example Request

```
GET /lines/34/extension
Host: xivoserver
Accept: application/json
```

### Example Response

```
HTTP/1.1 200 OK
Content-Type: application/json

{
  "line_id": 34,
  "extension_id": 12,
  "links": [
    {
      "rel": "lines_sip",
      "href": "https://xivoserver/1.1/lines_sip/34"
    },
    {
      "rel": "extensions",
      "href": "https://xivoserver/1.1/extensions/12"
    }
  ]
}
```

### Get the Line associated to an Extension

**Query**

```
GET /extensions/<extension_id>/line
```

	Error code	Error message	Description
<b>Errors</b>	404	Extension with id=<extension_id> does not exist	
	404	Extension with id=<extension_id> does not have a line	

**Example Request**

```
GET /extensions/48/line
Host: xivoserver
Accept: application/json
```

**Example Response**

```
HTTP/1.1 200 OK
Content-Type: application/json

{
  "line_id": 34,
  "extension_id": 48,
  "links": [
    {
      "rel": "lines_sip",
      "href": "https://xivoserver/1.1/lines_sip/34"
    },
    {
      "rel": "extensions",
      "href": "https://xivoserver/1.1/extensions/48"
    }
  ]
}
```

**Associate an Extension to a Line****Query**

```
POST /lines/<line_id>/extension
```

	Field	Required	Values	Description
<b>Input</b>	extension_id	yes	int	Must be an existing id

	Error code	Error message	Description
<b>Errors</b>	404	Line with id=<line_id> does not exist	
	400	Nonexistent parameters: extension_id <extension_id> does not exist	
	400	Invalid parameters: line with id <line_id> already has an extension	You must unassociate the current extension before reassociating a new one

**Example request**

```
POST /1.1/lines/75/extension
Host: xivoserver
Content-Type: application/json

{
```

```
{
  "extension_id": 46
}
```

### Example response

```
HTTP/1.1 201
Location: /1.1/lines/75/extension

{
  "line_id": 75,
  "extension_id": 46,
  "links": [
    {
      "rel": "lines_sip",
      "href": "https://xivoserver/1.1/lines_sip/75"
    },
    {
      "rel": "extensions",
      "href": "https://xivoserver/1.1/extensions/46"
    }
  ]
}
```

**Dissociate an Extension from a Line** Any devices that are attached to the line must be removed before dissociating an extension from its line. A device can be dissociated by resetting it to autoprovisioning mode. Consult the documentation on [Devices](#) for further details.

### Query

```
DELETE /1.1/lines/<line_id>/extension
```

Errors	Error code	Error message	Description
	404	Line with id=<line_id> does not exist	
	400	Invalid parameters: A device is still associated to the line	

### Example request

```
DELETE /1.1/lines/<line_id>/extension
Host: xivoserver
```

### Example response

```
HTTP/1.1 204 No Content
```

**Infos** A XiVO server infos

### Infos Representation

Description	Field	Values	Description
	uuid	string	XiVO's UUID

### Example

```
{
  "uuid": "6fa459ea-ee8a-3ca4-894e-db77e160355e",
  "links": [
    {
      "rel": "infos",
      "href": "https://xivoserver/1.1/infos?resource_id=6fa459ea-ee8a-3ca4-894e-db77e160355e"
    }
  ]
}
```

## Get Infos

### Query

```
GET /1.1/infos
```

### Example request

```
GET /1.1/infos HTTP/1.1
Host: xivoserver
Accept: application/json
```

### Example response

```
HTTP/1.1 200 OK
Content-Type: application/json

{
  "uuid": "6fa459ea-ee8a-3ca4-894e-db77e160355e"
}
```

## Users

### User Representation

	Field	Values	Description
Description	id	int	Read-only
	firstname	string	User's first name
	lastname	string	User's last name
	timezone	string	User's timezone
	language	string	User's language
	description	string	Additional information about the user
	caller_id	string	Name that appears on the phone when calling
	outgoing_caller_id	string	Caller id to use when calling through a trunk
	mobile_phone_number	string	Phone number for the user's mobile device
	username	string	username for connecting to the CTI
	password	string	password for connecting to the CTI
	music_on_hold	string	Name of the MOH category to use for music on hold
	preprocess_subroutine	string	Name of the subroutine to execute in asterisk before receiving a call
	userfield	string	A custom field which purpose is left to the client. If the user has no userfield, then this field is an empty string.

### Example

```
{
  "id": 1,
  "firstname": "John",
  "lastname": "Doe",
  "timezone": "America/Montreal",
  "language": "fr_FR",
  "description": "The most common name in America",
  "caller_id": "Johnny",
  "outgoing_caller_id": "default",
  "mobile_phone_number": "5554151234",
  "username": "john",
  "password": "supersecretpassword",
  "music_on_hold": "waiting",
  "preprocess_subroutine": "ivr",
  "userfield": ""
}
```

**List Users** The users are listed in ascending order on lastname, then firstname.

### Query

```
GET /1.1/users
```

### Parameters

**Warning:** parameter ‘q’ is now **DEPRECATED**. use ‘search’ instead

**q** List only users matching this filter. The filter is done on the firstname, lastname and firstname + lastname and is case insensitive.

**search** Search term. Only users with a field containing the search term will be listed.

**order** Sort the list using a column (e.g. “firstname”). Columns allowed: firstname, lastname, caller\_id, description, userfield

**direction** ‘asc’ or ‘desc’. Sort list in ascending (asc) or descending (desc) order.

**limit** maximum number of users to return in the list. Must be a positive integer.

**skip** number of users to skip over before starting the list. Must be a positive integer or zero.

**Example requests** Listing all available users:

```
GET /1.1/users HTTP/1.1
Host: xivoserver
Accept: application/json
```

Searching for a user called “john”:

```
GET /1.1/users?search=john HTTP/1.1
Host: xivoserver
Accept: application/json
```

### Example response

```
HTTP/1.1 200 OK
Content-Type: application/json

{
  "total": 2,
  "items":
  [
```

```

{
  "id": 1,
  "firstname": "John",
  "lastname": "Doe",
  "timezone": "",
  "language": "en_US",
  "description": "",
  "caller_id": "\"John Doe\"",
  "outgoing_caller_id": "default",
  "mobile_phone_number": "",
  "username": "",
  "password": "",
  "music_on_hold": "default",
  "preprocess_subroutine": "",
  "userfield": ""
},
{
  "id": 2,
  "firstname": "Mary",
  "lastname": "Sue",
  "timezone": "",
  "language": "fr_FR",
  "description": "",
  "caller_id": "\"Mary Sue\"",
  "outgoing_caller_id": "default",
  "mobile_phone_number": "",
  "username": "",
  "password": "",
  "music_on_hold": "default",
  "preprocess_subroutine": "",
  "userfield": ""
}
]
}

```

**List Users with a view** The users are listed with specific representation.

Representation	Field	Values	Description
	id	int	User's ID
	line_id	int	Line's ID
	agent_id	int	Agent's ID
	firstname	string	User's first name
	lastname	string	User's last name
	exten	string	User's phone number
	mobile_phone_number	string	Phone number for the user's mobile device

### Query

```
GET /1.1/users?view=directory
```

**Example requests** Listing all available users with directory view:

```

GET /1.1/users?view=directory HTTP/1.1
Host: xivoserver
Accept: application/json

```

### Example response

```
HTTP/1.1 200 OK
Content-Type: application/json

{
  "total": 2,
  "items":
  [
    {
      "id": 1,
      "line_id": 1,
      "agent_id": 1,
      "firstname": "John",
      "lastname": "Doe",
      "exten": "1234",
      "mobile_phone_number": "+14184765458"
    },
    {
      "id": 2,
      "line_id": null,
      "agent_id": null,
      "firstname": "Mary",
      "lastname": "Sue",
      "exten": "",
      "mobile_phone_number": ""
    }
  ]
}
```

### Get User

```
GET /1.1/users/<id>
```

### Example request

```
GET /1.1/users/1 HTTP/1.1
Host: xivoserver
Accept: application/json
```

### Example response

```
HTTP/1.1 200 OK
Content-Type: application/json

{
  "id": 1,
  "firstname": "John",
  "lastname": "Doe",
  "timezone": "",
  "language": "en_US",
  "description": "",
  "caller_id": "\"John Doe\"",
  "outgoing_caller_id": "default",
  "mobile_phone_number": "",
  "username": "",
  "password": "",
  "music_on_hold": "default",
  "preprocess_subroutine": "",
  "userfield": ""
}
```

### Create a User

## Query

```
POST /1.1/users
```

### Input

Field	Required	Values
firstname	yes	string
lastname	no	string
timezone	no	string. Must be a valid timezone
language	no	string. Must be a valid language
description	no	string
caller_id	no	string
outgoing_caller_id	no	string: default, anonymous or custom
mobile_phone_number	no	string of digits
username	no	string
password	no	string. Minimum of 4 characters
music_on_hold	no	string. Must be a valid category
preprocess_subroutine	no	string
userfield	no	string

### Errors

Error code	Error message	Description
400	error while creating User: <explanation>	See error message for more details

### Example request

```
POST /1.1/users HTTP/1.1
Host: xivoserver
Accept: application/json
Content-Type: application/json

{
  "firstname": "John",
  "lastname": "Doe",
  "userfield": ""
}
```

### Example response

```
HTTP/1.1 201 Created
Location: /1.1/users/1
Content-Type: application/json

{
  "id": 1,
  "firstname": "John",
  "lastname": "Doe",
  "timezone": "",
  "language": "en_US",
  "description": "",
  "caller_id": "\"John Doe\"",
  "outgoing_caller_id": "default",
  "mobile_phone_number": "",
  "username": "",
  "password": "",
  "music_on_hold": "default",
  "preprocess_subroutine": "",
  "userfield": ""
  "links" : [
    {
      "rel": "users",
```

```

    "href": "https://xivoserver/1.1/users/1"
  }
]
}

```

**Update a User** Only the fields that need to be modified can be set.

If the firstname or the lastname is modified, the name of associated voicemail is also updated.

### Query

```
PUT /1.1/users/<id>
```

**Input** Same as for creating a User. Please see [Create a User](#)

**Errors** Same as for creating a User. Please see [Create a User](#)

### Example request

```

PUT /1.1/users/67 HTTP/1.1
Host: xivoserver
Content-Type: application/json

{
  "firstname": "Jonathan"
}

```

### Example response

```
HTTP/1.1 204 No Content
```

**Delete User** A user can not be deleted if he is associated to a line or a voicemail. Any line or voicemail attached to the user must be dissociated first. Consult the documentation on [User Line Association](#) and [Voicemail Association](#) for further details.

The user will also be removed from all queues, groups or other XiVO entities whom he is member.

### Query

```
DELETE /1.1/users/<id>
```

Errors	Error code	Error message	Description
	400	error while deleting User: <explanation>	See error message for more details
	400	Error while deleting User: user still associated to a line	See explanation above
	400	Error while deleting User: user still associated to a voicemail	See explanation above
	404	User with id=X does not exist	The requested user was not found

### Example request

```

DELETE /1.1/users/67 HTTP/1.1
Host: xivoserver

```

**Example response**

```
HTTP/1.1 204 No Content
```

**User-Line Association** See *User Line Association*.

**Users-Voicemails Association** See *Voicemail Association*.

**Users-CTI profiles Association** See *User CTI configuration*.

**User CTI configuration****CTI Configuration Representation**

Description	Field	Value	Description
	user_id	int	User's ID. Read-only.
	cti_profile_id	int	CTI Profile's ID.
	enabled	bool	Status of the CTI configuration

**Get the CTI Configuration for a User****Query**

```
GET /users/<user_id>/cti
```

**Errors**

Error code	Error message	Description
404	User with id=<user_id> does not exist	

**Example Request**

```
GET /users/34/cti
Host: xivoserver
Accept: application/json
```

**Example Response**

```
HTTP/1.1 200 OK
Content-Type: application/json

{
  "user_id": 34,
  "cti_profile_id": 2,
  "enabled": true,
  "links": [
    {
      "rel": "users",
      "href": "https://xivoserver/1.1/users/34"
    },
    {
      "rel": "cti_profiles",
      "href": "https://xivoserver/1.1/cti_profiles/2"
    }
  ]
}
```

## Edit the CTI configuration of a user

### Query

```
PUT /users/<user_id>/cti
```

Input	Field	Required	Values	Description
	cti_profile_id	yes	int	Must be an existing id
	enabled	yes	bool	Enable / disable the CTI

Errors	Error code	Error message	Description
	404	User with id=<user_id> does not exist	
	400	Nonexistent parameters: cti_profile_id <cti_profile_id> does not exist	
	400	Error while editing <user_id> : the user must have a username and password to enable the CTI	Add a username and a password to the user

### Example request

```
PUT /1.1/users/75/cti
Host: xivoserver
Content-Type: application/json

{
  "cti_profile_id": 3,
  "enabled": true
}
```

### Example response

```
HTTP/1.1 204 No Content
```

**User Line Association** Service for associating a user with a line.

### Association Representation

Description	Field	Value	Description
	line_id	bool	Line's ID
	main_user	boolean	Read-only. True if the user is the first to have been associated to the line.
	main_line	boolean	Read-only. To be implemented later. Always true.
	links	list	The links to the related resources

### Get the Lines associated to a User

#### Query

```
GET /1.1/users/<user_id>/lines
```

Errors	Error code	Error message	Description
	404	User with id=<user_id> does not exist	

**Example request**

```
GET /1.1/users/20/lines
Host: xivoserver
Accept: application/json
```

**Example response**

```
HTTP/1.1 200 OK
Content-Type: application/json

{
  "total": 1,
  "items": [
    {
      "user_id": 20,
      "line_id": 132,
      "main_user": true,
      "main_line": true,
      "links": [
        {
          "rel": "lines",
          "href": "https://xivoserver/1.1/lines/132"
        },
        {
          "rel": "users",
          "href": "https://xivoserver/1.1/users/20"
        }
      ]
    }
  ]
}
```

**Associate a Line to a User****Query**

```
POST /1.1/users/<user_id>/lines
```

Input	Field	Required	Values	Description
	line_id	yes	int	Must be an existing id

Errors	Error code	Error message	Description
	400	Nonexistent parameters: user_id <user_id> does not exist	
	400	Nonexistent parameters: line_id <line_id> does not exist	
	400	Invalid parameters: user is already associated to this line	
	400	Invalid parameters: There is an extension associated to this line	

**Example request**

```
POST /1.1/users/59/lines
Host: xivoserver
Content-Type: application/json

{
  "line_id": 432
}
```

### Example response

```
HTTP/1.1 201
Location: /1.1/users/59/lines

{
  "user_id": 59,
  "line_id": 432,
  "main_user": true,
  "main_line": true,
  "links": [
    {
      "rel": "lines",
      "href": "https://xivoserver/1.1/lines/432"
    },
    {
      "rel": "users",
      "href": "https://xivoserver/1.1/users/59"
    }
  ]
}
```

**Dissociate a User from a Line** Any devices that are attached the line must be removed before dissociating a user from its line. A device can be dissociated by resetting it to autoprovision mode. Consult the documentation on [Devices](#) for further details.

### Query

```
DELETE /1.1/users/<user_id>/lines/<line_id>
```

Errors	Error code	Error message	Description
	400	User with id=<user_id> is not associated with line id=<line_id>	
	400	Invalid parameters: There are secondary users associated to this user_line	
	400	Invalid parameters: A device is still associated to the line	

### Example request

```
DELETE /1.1/users/59/lines/598
Host: xivoserver
Content-Type: application/json
```

### Example response

```
HTTP/1.1 204 No Content
```

## Voicemails

### Voicemail Representation

Description	Field	Values	Description
	id	integer	(Read-only)
	name	string	Voicemail name.
	number	string	Voicemail number.
	context	string	Voicemail's context.
	password	string	Numeric password used to access the mailbox
	email	string	Email address where messages with an audio attachment will be sent.
	pager	string	Email address where a short notification will be sent
	language	string	Language used for the voicemail menu prompt. See <i>Voicemail languages</i> for a list of available languages.
	timezone	string	Timezone used for announcing at what time a message was recorded. See <i>Voicemail timezones</i> for a list of timezones.
	max_messages	integer	Maximum number of messages to store.
	attach_audio	boolean	Attach an audio file of the recorded message when sending an email.
	delete_messages	boolean	Delete messages once they have been listened to.
	ask_password	boolean	Ask for password when accessing the voicemail menu.

### Example

```
{
  "id": "1",
  "name": "John Doe",
  "number": "1000",
  "context": "default",
  "password": "1234",
  "email": "john.doe@example.com",
  "pager": "john.mobile@example.com",
  "language": "en_US",
  "timezone": "eu-fr",
  "max_messages": 10,
  "attach_audio": false,
  "delete_messages": false,
  "ask_password": true,
  "links": [
    {
      "rel": "voicemails",
      "href": "https://xivoserver/1.1/voicemails/1"
    }
  ]
}
```

### Voicemail list

#### Query

```
GET /1.1/voicemails
```

#### Parameters

**order** Sort the list using a column (e.g. “number”). Columns allowed: name, number, context, email, language, timezone.

**direction** ‘asc’ or ‘desc’. Sort list in ascending (asc) or descending (desc) order

**limit** total number of voicemails to show in the list. Must be a positive integer

**skip** number of voicemails to skip over before starting the list. Must be a positive integer

**search** Search voicemails. Only voicemails with a field containing the search term will be listed.

Errors	Error code	Error message	Description
	400	Invalid parameters: limit must be a positive number	the 'limit' parameter must be a number
	400	Invalid parameters: skip must be a positive number	the 'skip' parameter must be a number
	400	Invalid parameters: ordering parameter '<field>' does not exist	you must use one of the fields available in a device when sorting a list
	400	Invalid parameters: direction parameter '<direction>' does not exist	use either 'asc' or 'desc' as a direction when sorting a list

**Example requests** List all available voicemails:

```
GET /1.1/voicemails HTTP/1.1
Host: xivoserver
Accept: application/json
```

List voicemails, sort by descending number:

```
GET /1.1/voicemails?order=number&direction=desc
Host: xivoserver
Accept: application/json
```

List only the first 10 voicemails containing the word "john":

```
GET /1.1/voicemails?search=john&limit=10
Host: xivoserver
Accept: application/json
```

**Example response**

```
HTTP/1.1 200 OK
Content-Type: application/json

{
  "total": 2,
  "items": [
    {
      "id": "1",
      "name": "John Doe",
      "number": "1000",
      "context": "default",
      "password": null,
      "email": "john.doe@example.com",
      "pager": "john.mobile@example.com",
      "language": "en-US",
      "timezone": "eu-fr",
      "max_messages": null,
      "attach_audio": false,
      "delete_messages": false,
      "ask_password": false,
      "links": [
        {
          "rel": "voicemails",
          "href": "https://xivoserver/1.1/voicemails/1"
        }
      ]
    }
  ]
}
```

```

    },
    {
      "id": "2",
      "name": "Roger Smith",
      "number": "1001",
      "context": "default",
      "password": null,
      "email": null,
      "pager": null,
      "language": "en_US",
      "timezone": "eu-fr",
      "max_messages": 20,
      "attach_audio": false,
      "delete_messages": false,
      "ask_password": false,
      "links": [
        {
          "rel": "voicemails",
          "href": "https://xivoserver/1.1/voicemails/2"
        }
      ]
    }
  ]
}

```

## Get Voicemail

### Query

```
GET /1.1/voicemails/<id>
```

### Example request

```

GET /1.1/voicemails/1 HTTP/1.1
Host: xivoserver
Accept: application/json

```

### Example response

```

HTTP/1.1 200 OK
Content-Type: application/json

{
  "id": "1",
  "name": "John Doe",
  "number": "1000",
  "context": "default",
  "password": null,
  "email": "john.doe@example.com",
  "pager": null,
  "language": "en_US",
  "timezone": "eu-fr",
  "max_messages": null,
  "attach_audio": false,
  "delete_messages": false,
  "ask_password": false,
  "links": [
    {
      "rel": "voicemails",
      "href": "https://xivoserver/1.1/voicemails/2"
    }
  ]
}

```

```
]
}
```

## Create a Voicemail

### Query

```
POST /1.1/voicemails
```

Input	Field	Re-quired	Val-ues	Notes
	name	yes	string	
	number	yes	string	Must be a string of positive numbers
	context	yes	string	
	pass-word	no	string	Must be a string of positive numbers
	email	no	string	
	language	no	string	Consult <a href="#">Voicemail Languages</a> for a list of valid languages. The system default will be used if none is specified.
	timezone	no	string	Consult <a href="#">Voicemail Timezones</a> for a list of valid timezones. The system default will be used if none is specified.
	max_messages	yes	in-te-ger	Valid values are: 1,10,15,20,25,50,75,100,125,150,175,200,300,400,500,600,700,800,900,1000,2000,3000,4000
	at-tach_audio	no	boolean	Default value is <i>false</i>
	delete_messages	yes	boolean	Default value is <i>false</i>
	ask_password	no	boolean	Default value is <i>false</i>

Errors	Error code	Error message	Description
	500	Error while creating Voicemail: <explanation>	See explanation for more details.
	400	Error while creating Voicemail: number <number> already exists	A voicemail with the same number already exists. Use another number.
	400	Invalid parameters: password	Only numeric passwords are supported.
	400	Invalid parameters: number <number> must be a sequence of positive numbers	The string must only have positive numbers
	400	Invalid parameters: max_messages must be greater than 0	Only positive integers are accepted.
	400	Nonexistent parameters: context <context> does not exist	The context used by the voicemail does not exist. You must create the context first.
	400	Nonexistent parameters: language <language> does not exist	Consult <a href="#">Voicemail Languages</a> for a list of available languages.
	400	Nonexistent parameters: timezone <timezone> does not exist	Consult <a href="#">Voicemail Timezones</a> for a list of available timezones.
	400	Missing parameters: <list of missing fields>	

### Example request

```
POST /1.1/voicemails HTTP/1.1
Host: xivoserver
Accept: application/json
Content-Type: application/json

{
  "name": "John Doe",
```

```

    "number": "1000",
    "context": "default"
  }

```

### Example response

```

HTTP/1.1 201 Created
Location: /1.1/voicemails/1
Content-Type: application/json

{
  "id": "1",
  "name": "John Doe",
  "number": "1000",
  "context": "default",
  "password": null,
  "email": null,
  "pager": null,
  "language": null,
  "timezone": "eu-fr",
  "max_messages": null,
  "attach_audio": false,
  "delete_messages": false,
  "ask_password": false,
  "links": [
    {
      "rel": "voicemails",
      "href": "https://xivosever/1.1/voicemails/2"
    }
  ]
}

```

**Update a Voicemail** Only the fields that need to be updated must be sent during an update. A voicemail can only be updated if it isn't associated to a user.

### Query

```
PUT /1.1/voicemails/<id>
```

### Parameters

**id** Voicemail's id

**Input** Same as for creating a voicemail. Please see *Create a Voicemail*

**Errors** Same as creating a voicemail (See *Create a Voicemail*) with the following additions:

Error code	Error message	Description
400	Error while editing Voicemail: cannot edit a voicemail associated to a user	

### Example request

```

PUT /1.1/voicemails/1 HTTP/1.1
Host: xivosever
Content-Type: application/json

{
  "number": "2000",

```

```
"attach_audio": true
}
```

### Example response

```
HTTP/1.1 204 No Content
```

**Delete a Voicemail** A voicemail can not be deleted if it is still attached to a user. The user must be dissociated first. Consult the documentation on [Voicemail Association](#) for further details.

**Warning:** Any extension that redirects to the voicemail (e.g. an Incoming call) will be disabled after deletion.

Errors	Error code	Error message	Description
	400	error while deleting Voicemail <explanation>	See error message for more details
	400	error while deleting Voicemail: Cannot delete a voicemail associated to a user	You must unassociate a user from his voicemail before deleting it
	404	Voicemail with uniqueid=X does not exist	The requested voicemail was not found or does not exist

### Query

```
DELETE /1.1/voicemails/<id>
```

### Example request

```
DELETE /1.1/voicemails/1 HTTP/1.1
Host: xivoserver
```

### Example response

```
HTTP/1.1 204 No Content
```

### Voicemail Languages

**Warning:** Not yet implemented.

Returns a list of languages that can be used when creating or updating a voicemail.

### Query

```
GET /1.1/voicemails/languages
```

### Example request

```
GET /1.1/voicemails/languages HTTP/1.1
Host: xivoserver
Content-Type: application/json
```

### Example response

```
HTTP/1.1 200 OK
Content-Type: application/json

{
  "total": 7,
  "items": [
```

```

        "de_DE",
        "en_US",
        "es_ES",
        "fr_FR",
        "fr_CA",
        "it_IT",
        "nl_NL"
    ]
}

```

**Voicemail Timezones****Warning:** Not yet implemented.

Returns a list of timezones that can be used when creating or updating a voicemail.

**Query**

```
GET /1.1/voicemails/timezones
```

**Example request**

```

GET /1.1/voicemails/timezones HTTP/1.1
Host: xivoserver
Content-Type: application/json

```

**Example response**

```

HTTP/1.1 200 OK
Content-Type: application/json

{
  "total": 1,
  "items": [
    "eu-fr"
  ]
}

```

**Voicemail Association** Service for associating a user with a voicemail.

**Association Representation**

Description	Field	Value	Description
	voicemail_id	int	Voicemail's ID
	enabled	bool	Enable voicemail for user

**Get the Voicemail associated to a User****Query**

```
GET /1.1/users/<user_id>/voicemail
```

Errors	Error code	Error message	Description
	404	Invalid parameters: user with id=<user_id> does not have a voicemail	
	404	User with id=<user_id> does not exist	

### Example request

```
GET /1.1/users/20/voicemail
Host: xivoserver
Accept: application/json
```

### Example response

```
HTTP/1.1 200 OK
Content-Type: application/json

{
  "voicemail_id": 132,
  "user_id": 20,
  "enabled": true,
  "links": [
    {
      "rel": "voicemails",
      "href": "https://xivoserver/1.1/voicemails/132"
    },
    {
      "rel": "users",
      "href": "https://xivoserver/1.1/users/20"
    }
  ]
}
```

## Associate a User to a Voicemail

### Query

```
POST /1.1/users/<user_id>/voicemail
```

Input	Field	Required	Values	Description
	voicemail_id	yes	int	Must be an existing id
	enabled	no	bool	Default value : true

Errors	Error code	Error message	Description
	400	Nonexistent parameters: voicemail_id <voicemail_id> does not exist	
	400	Invalid parameters: user with id <user_id> does not have any line	A user needs to have a line to associate a voicemail
	400	Invalid parameters: user with id <user_id> already has a voicemail	You must unassociate the current voicemail before reassociating a new one

### Example request

```
POST /1.1/users/59/voicemail
Host: xivoserver
Content-Type: application/json

{
  "voicemail_id": 432,
  "enabled": false,
}
```

**Example response**

```

HTTP/1.1 201
Location: /1.1/users/59/voicemail

{
  "voicemail_id": 432,
  "user_id": 59,
  "enabled": false,
  "links": [
    {
      "rel": "voicemails",
      "href": "https://xivoserver/1.1/voicemails/432"
    },
    {
      "rel": "users",
      "href": "https://xivoserver/1.1/users/59"
    }
  ]
}

```

**Deassociate a User from a Voicemail****Query**

```
DELETE /1.1/users/<user_id>/voicemail
```

**Example request**

```
DELETE /1.1/users/20/voicemail
Host: xivoserver
```

**Example response**

```
HTTP/1.1 204 No Content
```

**Migration from 1.0****URL**

- Occurences of 1.0 have been replaced for 1.1
- Trailing slashes have been removed.

For example, in 1.0, the URL to list users is:

```
/1.0/users/
```

In 1.1, it is:

```
/1.1/users
```

**XiVO provd API**

This section describes the REST API provided by the xivo-provd application.

If you want to interact with the REST API of the xivo-provd daemon that is executing as part of XiVO, you should be careful on which operation you are doing as to not cause stability problem to other parts of the XiVO ecosystem. Mostly, this means being careful when editing or deleting devices and configs.

By default, the REST API of xivo-provd is accessible only from localhost on port 8666. No authentication is required.

**Warning:** Major changes could happen to this API.

**API** The description of the API has been split into these sections:

### Provd Management

**Get the Provd Manager** The provd manager resource represents the main entry point to the xivo-provd REST API.

It links to the following resources:

- The `dev` relation links to a *device manager*.
- The `cfg` relation links to a *config manager*.
- The `pg` relation links to a *plugin manager*.
- The `srv.configure` relation links to the provd manager *configuration service*.

### Query

GET /provd

### Example request

GET /provd HTTP/1.1  
Host: xivoserver  
Accept: application/vnd.proformatique.provd+json

### Example response

HTTP/1.1 200 OK  
Content-Type: application/vnd.proformatique.provd+json  
  
{  
 "links": [  
 {  
 "href": "/provd/dev\_mgr",  
 "rel": "dev"  
 },  
 {  
 "href": "/provd/cfg\_mgr",  
 "rel": "cfg"  
 },  
 {  
 "href": "/provd/pg\_mgr",  
 "rel": "pg"  
 },  
 {  
 "href": "/provd/configure",  
 "rel": "srv.configure"  
 }  
 ]  
}

### Devices Management

**Get the Device Manager** The device manager links to the following resources:

- The `dev.synchronize` relation links to the *device synchronization service*.
- The `dev.reconfigure` relation links to the *device reconfiguration service*.
- The `dev.dhcpinfo` relation links to the *device DHCP information service*.
- The `dev.devices` relation links to the *list of devices*.

### Query

```
GET /provd/dev_mgr
```

### Example request

```
GET /provd/dev_mgr HTTP/1.1
Host: xivoserver
Accept: application/vnd.proformatique.provd+json
```

### Example response

```
HTTP/1.1 200 OK
Content-Type: application/vnd.proformatique.provd+json

{
  "links": [
    {
      "href": "/provd/dev_mgr/synchronize",
      "rel": "dev.synchronize"
    },
    {
      "href": "/provd/dev_mgr/reconfigure",
      "rel": "dev.reconfigure"
    },
    {
      "href": "/provd/dev_mgr/dhcpinfo",
      "rel": "dev.dhcpinfo"
    },
    {
      "href": "/provd/dev_mgr/devices",
      "rel": "dev.devices"
    }
  ]
}
```

## List Devices

### Query

```
GET /provd/dev_mgr/devices
```

### Query Parameters

Field	Description
q	A selector, encoded in JSON, describing which device should be returned. All devices are returned not specified. Example: <code>q={"ip": "10.34.1.119"}</code>
fields	A list of fields, separated by comma. Example: <code>fields=mac,ip</code>
skip	An integer specifying the number of devices to skip. Example: <code>skip=10</code>
sort	The key on which to sort the results. Example: <code>sort=id</code>
sort_order	The order of sort; either ASC or DESC.

### Example request

```
GET /provd/dev_mgr/devices HTTP/1.1
Host: xivoserver
Accept: application/vnd.proformatique.provd+json
```

### Example response

```
HTTP/1.1 200 OK
Content-Type: application/vnd.proformatique.provd+json

{
  "devices": [
    {
      "added": "auto",
      "config": "38e5e08ffe804b468f5aa53b9536bb25",
      "configured": true,
      "description": "",
      "id": "38e5e08ffe804b468f5aa53b9536bb25",
      "ip": "10.34.1.122",
      "mac": "00:08:5d:33:e5:76",
      "model": "6731i",
      "plugin": "xivo-aastra-3.3.1-SP2",
      "remote_state_sip_username": "je5qtq",
      "vendor": "Aastra",
      "version": "3.3.1.2235"
    }
  ]
}
```

## Create a Device

### Query

```
POST /provd/dev_mgr/devices
```

### Example request

```
POST /provd/dev_mgr/devices HTTP/1.1
Host: xivoserver
Content-Type: application/vnd.proformatique.provd+json

{
  "device": {
    "ip": "192.168.1.1",
    "mac": "00:11:22:33:44:55",
    "plugin": "xivo-aastra-3.3.1-SP2"
  }
}
```

### Example response

```
HTTP/1.1 201 Created
Content-Type: application/vnd.proformatique.provd+json
Location: /provd/dev_mgr/devices/68b10c99945b4fb889f22a7559fc3271

{"id": "68b10c99945b4fb889f22a7559fc3271"}
```

If the `id` field is not given, then an ID is automatically generated by the server.

### Get a Device

## Query

```
GET /provd/dev_mgr/devices/<device_id>
```

## Example request

```
GET /provd/dev_mgr/devices/68b10c99945b4fb889f22a7559fc3271 HTTP/1.1
Host: xivoserver
Accept: application/vnd.proformatique.provd+json
```

## Example response

```
HTTP/1.1 200 OK
Content-Type: application/vnd.proformatique.provd+json

{
  "device": {
    "added": "auto",
    "config": "38e5e08ffe804b468f5aa53b9536bb25",
    "configured": true,
    "description": "",
    "id": "38e5e08ffe804b468f5aa53b9536bb25",
    "ip": "10.34.1.122",
    "mac": "00:08:5d:33:e5:76",
    "model": "6731i",
    "plugin": "xivo-aastra-3.3.1-SP2",
    "remote_state_sip_username": "je5qtq",
    "vendor": "Aastra",
    "version": "3.3.1.2235"
  }
}
```

## Update a Device

## Query

```
PUT /provd/dev_mgr/devices/<device_id>
```

## Example request

```
PUT /provd/dev_mgr/devices/68b10c99945b4fb889f22a7559fc3271 HTTP/1.1
Host: xivoserver
Content-Type: application/vnd.proformatique.provd+json

{
  "device": {
    "added": "auto",
    "config": "38e5e08ffe804b468f5aa53b9536bb25",
    "configured": true,
    "description": "",
    "id": "38e5e08ffe804b468f5aa53b9536bb25",
    "ip": "10.34.1.122",
    "mac": "00:08:5d:33:e5:76",
    "model": "6731i",
    "plugin": "xivo-aastra-3.4",
    "remote_state_sip_username": "je5qtq",
    "vendor": "Aastra",
    "version": "3.3.1.2235"
  }
}
```

### Example response

```
HTTP/1.1 204 No Content
```

### Delete a Device

#### Query

```
DELETE /provd/dev_mgr/devices/<device_id>
```

### Example request

```
DELETE /provd/dev_mgr/devices/68b10c99945b4fb889f22a7559fc3271 HTTP/1.1
Host: xivoserver
```

### Example response

```
HTTP/1.1 204 No Content
```

### Synchronize a Device

#### Query

```
POST /provd/dev_mgr/synchronize
```

### Example request

```
POST /provd/dev_mgr/synchronize HTTP/1.1
Host: xivoserver
Content-Type: application/vnd.proformatique.provd+json

{
  "id": "d035bccaf0dd4a8396fc57a3329ca0a4"
}
```

### Example response

```
HTTP/1.1 201 Created
Location: /provd/dev_mgr/synchronize/42
```

The URI returned in the `Location` header points to an *operation in progress* resource.

### Reconfigure a Device

#### Query

```
POST /provd/dev_mgr/reconfigure
```

Errors	Error code	Error message	Description
	400	invalid device ID	

### Example request

```
POST /provd/dev_mgr/reconfigure HTTP/1.1
Host: xivoserver
Content-Type: application/vnd.proformatique.provd+json

{
  "id": "d035bccaf0dd4a8396fc57a3329ca0a4"
}
```

**Example response**

```
HTTP/1.1 204 No Content
```

**Push DHCP Request Information****Query**

```
POST /provd/dev_mgr/dhcpinfo
```

**Example request**

```
POST /provd/dev_mgr/dhcpinfo HTTP/1.1
Host: xivoserver
Content-Type: application/vnd.proformatique.provd+json

{
  "dhcp_info": {
    "ip": "192.168.1.100",
    "mac": "00:11:22:33:44:55",
    "op": "commit",
    "options": [
      "06066.6f.6f.62.61.72.a"
    ]
  }
}
```

**Example response**

```
HTTP/1.1 204 No Content
```

**Configs Management**

**Get the Config Manager** The config manager links to the following resources:

- The `cfg.configs` relation links to the *list of configs*.
- The `cfg.autocreate` relation links to the *config autocreate service*.

**Query**

```
GET /provd/cfg_mgr
```

**Example request**

```
GET /provd/cfg_mgr HTTP/1.1
Host: xivoserver
Accept: application/vnd.proformatique.provd+json
```

### Example response

```
HTTP/1.1 200 OK
Content-Type: application/vnd.proformatique.provd+json

{
  "links": [
    {
      "href": "/provd/cfg_mgr/configs",
      "rel": "cfg.configs"
    },
    {
      "href": "/provd/cfg_mgr/autocreate",
      "rel": "cfg.autocreate"
    }
  ]
}
```

### List Configs

#### Query

```
GET /provd/cfg_mgr/configs
```

**Query Parameters** These are the *same parameters as for the list devices* action.

#### Example request

```
GET /provd/cfg_mgr/configs HTTP/1.1
Host: xivoserver
Accept: application/vnd.proformatique.provd+json
```

### Example response

```
HTTP/1.1 200 OK
Content-Type: application/vnd.proformatique.provd+json

{
  "configs": [
    {
      "configdevice": "defaultconfigdevice",
      "deletable": true,
      "id": "38e5e08ffe804b468f5aa53b9536bb25",
      "parent_ids": [
        "base",
        "defaultconfigdevice"
      ],
      "raw_config": {
        "X_key": "",
        "exten_dnd": "*25",
        "exten_fwd_busy": "*23",
        "exten_fwd_disable_all": "*20",
        "exten_fwd_no_answer": "*22",
        "exten_fwd_unconditional": "*21",
        "exten_park": null,
        "exten_pickup_call": "*8",
        "exten_pickup_group": null,
        "exten_voicemail": "*98",
        "funckeys": {
          "1": {
```

```

        "label": "",
        "line": 1,
        "type": "speeddial",
        "value": "1005"
    },
    },
    "protocol": "SIP",
    "sip_dtmf_mode": "SIP-INFO",
    "sip_lines": {
        "1": {
            "auth_username": "je5qtq",
            "display_name": "E1\u00e8s 01",
            "number": "1001",
            "password": "T2S7C0",
            "proxy_ip": "10.34.1.11",
            "registrar_ip": "10.34.1.11",
            "username": "je5qtq"
        }
    }
}
]
}

```

## Create a Config

### Query

```
POST /provd/cfg_mgr/configs
```

### Example request

```

POST /provd/cfg_mgr/configs HTTP/1.1
Host: xivoserver
Content-Type: application/vnd.proformatique.provd+json

{
  "config": {
    "parent_ids": [
      "base"
    ],
    "raw_config": {
      "sip": {
        "lines": {
          "1": {
            "auth_username": "100",
            "display_name": "Foo",
            "password": "100",
            "username": "100"
          }
        }
      }
    }
  }
}

```

### Example response

```

HTTP/1.1 201 Created
Content-Type: application/vnd.proformatique.provd+json
Location: /provd/cfg_mgr/configs/77839d0f05c84662864b0ae5c27b33e4

```

```
{"id": "77839d0f05c84662864b0ae5c27b33e4"}
```

If the `id` field is not given, then an ID is automatically generated by the server.

### Get a Config

#### Query

```
GET /provd/cfg_mgr/configs/<config_id>
```

#### Example request

```
GET /provd/cfg_mgr/configs/77839d0f05c84662864b0ae5c27b33e4 HTTP/1.1
Host: xivoserver
Accept: application/vnd.proformatique.provd+json
```

#### Example response

```
HTTP/1.1 200 OK
Content-Type: application/vnd.proformatique.provd+json

{
  "config": {
    "id": "77839d0f05c84662864b0ae5c27b33e4",
    "parent_ids": [
      "base"
    ],
    "raw_config": {
      "sip": {
        "lines": {
          "1": {
            "auth_username": "100",
            "display_name": "Foo",
            "password": "100",
            "username": "100"
          }
        }
      }
    }
  }
}
```

### Get a Raw Config

#### Query

```
GET /provd/cfg_mgr/configs/<config_id>/raw
```

#### Example request

```
GET /provd/cfg_mgr/configs/77839d0f05c84662864b0ae5c27b33e4/raw HTTP/1.1
Host: xivoserver
Accept: application/vnd.proformatique.provd+json
```

#### Example response

```

HTTP/1.1 200 OK
Content-Type: application/vnd.proformatique.provd+json

{
  "raw_config": {
    "X_xivo_phonebook_ip": "10.34.1.11",
    "http_port": 8667,
    "ip": "10.34.1.11",
    "ntp_enabled": true,
    "ntp_ip": "10.34.1.11",
    "sip": {
      "lines": {
        "1": {
          "auth_username": "100",
          "display_name": "John",
          "password": "100",
          "username": "100"
        }
      }
    },
    "tftp_port": 69
  }
}

```

## Update a Config

### Query

```
PUT /provd/cfg_mgr/configs/<config_id>
```

### Example request

```

PUT /provd/cfg_mgr/configs/77839d0f05c84662864b0ae5c27b33e4 HTTP/1.1
Host: xivoserver
Content-Type: application/vnd.proformatique.provd+json

{
  "config": {
    "id": "77839d0f05c84662864b0ae5c27b33e4",
    "parent_ids": [
      "base"
    ],
    "raw_config": {
      "sip": {
        "lines": {
          "1": {
            "auth_username": "100",
            "display_name": "John",
            "password": "100",
            "username": "100"
          }
        }
      }
    }
  }
}

```

### Example response

```
HTTP/1.1 204 No Content
```

### Delete a Config

#### Query

```
DELETE /provd/cfg_mgr/configs/<config_id>
```

#### Example request

```
DELETE /provd/cfg_mgr/configs/77839d0f05c84662864b0ae5c27b33e4
Host: xivoserver
```

#### Example response

```
HTTP/1.1 204 No Content
```

**Autocreate a Config** This service is used to create a new config from the config that has the `autocreate` role.

#### Query

```
POST /provd/cfg_mgr/autocreate
```

#### Example request

```
POST /provd/cfg_mgr/autocreate HTTP/1.1
Host: xivoserver
Content-Type: application/vnd.proformatique.provd+json

{}
```

#### Example response

```
HTTP/1.1 201 Created
Content-Type: application/vnd.proformatique.provd+json
Location: /provd/cfg_mgr/configs/autoprov1411400365

{"id": "autoprov1411400365"}
```

## Plugins Management

**Get the Plugin Manager** The plugin manager links to the following resources:

- The `srv.install` relation links to the plugin manager *installation service*. This installation service permits installing/uninstalling plugins.
- The `pg.plugins` relation links to the *list of plugins*.
- The `pg.reload` relation links to the *plugin reload service*.

#### Query

```
GET /provd/pg_mgr
```

#### Example request

```
GET /provd/pg_mgr HTTP/1.1
Host: xivoserver
Accept: application/vnd.proformatique.provd+json
```

### Example response

```
HTTP/1.1 200 OK
Content-Type: application/vnd.proformatique.provd+json

{
  "links": [
    {
      "href": "/provd/pg_mgr/install",
      "rel": "srv.install"
    },
    {
      "href": "/provd/pg_mgr/plugins",
      "rel": "pg.plugins"
    },
    {
      "href": "/provd/pg_mgr/reload",
      "rel": "pg.reload"
    }
  ]
}
```

**List Plugins** List the installed plugins.

If you want to install/uninstall plugins, you need to go through the plugin installation service.

### Query

```
GET /provd/pg_mgr/plugins
```

### Example request

```
GET /provd/pg_mgr/plugins HTTP/1.1
Host: xivoserver
Accept: application/vnd.proformatique.provd+json
```

### Example response

```
HTTP/1.1 200 OK
Content-Type: application/vnd.proformatique.provd+json

{
  "plugins": {
    "xivo-aastra-3.3.1-SP2": {
      "links": [
        {
          "href": "/provd/pg_mgr/plugins/xivo-aastra-3.3.1-SP2",
          "rel": "pg.plugin"
        }
      ]
    },
    "xivo-cisco-sccp-9.0.3": {
      "links": [
        {
          "href": "/provd/pg_mgr/plugins/xivo-cisco-sccp-9.0.3",
          "rel": "pg.plugin"
        }
      ]
    }
  }
}
```

```

    ]
  }
}

```

**Get a Plugin** The plugin links to the following resources:

- The `pg.info` relation links to the *plugin information*.
- The `srv.install` relation links to the plugin *installation service*. Plugins usually provided this service to install/uninstall firmware and language files.

### Query

```
GET /provd/pg_mgr/plugins/<plugin_id>
```

### Example request

```
GET /provd/pg_mgr/plugins/xivo-aastra-3.3.1-SP2 HTTP/1.1
Host: xivoserver
Accept: application/vnd.proformatique.provd+json
```

### Example response

```
HTTP/1.1 200 OK
Content-Type: application/vnd.proformatique.provd+json

{
  "links": [
    {
      "href": "/provd/pg_mgr/plugins/xivo-aastra-3.3.1-SP2/info",
      "rel": "pg.info"
    },
    {
      "href": "/provd/pg_mgr/plugins/xivo-aastra-3.3.1-SP2/install",
      "rel": "srv.install"
    }
  ]
}
```

## Get Information of a Plugin

### Query

```
GET /provd/pg_mgr/plugins/<plugin_id>/info
```

### Example request

```
GET /provd/pg_mgr/plugins/xivo-aastra-3.3.1-SP2/info HTTP/1.1
Host: xivoserver
Accept: application/vnd.proformatique.provd+json
```

### Example response

```
HTTP/1.1 200 OK
Content-Type: application/vnd.proformatique.provd+json

{
  "plugin_info": {
```

```

    "capabilities": {
      "Aastra, 6730i, 3.3.1.5089": {
        "sip.lines": 6
      },
      "Aastra, 6731i, 3.3.1.2235": {
        "sip.lines": 6,
        "switchboard": true
      },
      "Aastra, 6735i, 3.3.1.5089": {
        "sip.lines": 9
      },
      "Aastra, 6737i, 3.3.1.5089": {
        "sip.lines": 9
      },
      "Aastra, 6739i, 3.3.1.2235": {
        "sip.lines": 9
      },
      "Aastra, 6753i, 3.3.1.2235": {
        "sip.lines": 9
      },
      "Aastra, 6755i, 3.3.1.2235": {
        "sip.lines": 9,
        "switchboard": true
      },
      "Aastra, 6757i, 3.3.1.2235": {
        "sip.lines": 9,
        "switchboard": true
      },
      "Aastra, 9143i, 3.3.1.2235": {
        "sip.lines": 9
      },
      "Aastra, 9480i, 3.3.1.2235": {
        "sip.lines": 9
      }
    },
    "description": "Plugin for Aastra 6730i, 6731i, 6735i, 6737i, 6739i, 6753i, 6755i, 6757i, 9143i, 9480i",
    "version": "1.1"
  }
}

```

**Reload a Plugin** Reload the given plugin. This is mostly useful during plugin development, after changing the code of the plugin, instead of restarting the xivo-provd application.

### Query

```
POST /provd/pg_mgr/reload
```

### Example request

```

POST /provd/pg_mgr/reload HTTP/1.1
Host: xivoserver
Content-Type: application/vnd.proformatique.provd+json

{
  "id": "xivo-aastra-3.3.1-SP2"
}

```

### Example response

```
HTTP/1.1 204 No Content
```

**General Resources** This section describes the resources that are available from more than one URI or are generic enough to not fit in a more specific section.

**Operation In Progress** This resource represents an operation in progress and is used to follow the progress of an underlying operation. Said differently, it is a monitor on an operation that can change over time.

### Get Current Status

#### Query

```
GET <uri>
```

#### Example request

```
GET <uri> HTTP/1.1
Host: xivoserver
Accept: application/vnd.proformatique.provd+json
```

#### Example response

```
HTTP/1.1 200 OK
Content-Type: application/vnd.proformatique.provd+json

{
  "status": "progress"
}
```

The status field describe the current status of the operation. The format is [label]]state[;current[/end]] (\(sub\_oips\))\* . Here's some examples:

- progress
- download|progress
- download|progress;10
- download|progress;10/100
- download|progress(file\_1|progress;20/100)(file\_2|waiting;0/50)
- download|progress;20/150(file\_1|progress)(file\_2|waiting)
- op1|progress(op1|progress(op1|1|progress)(op12|waiting))(op2|progress)

The state of an operation is either waiting, progress, success or fail.

**Delete** Delete the “operation in progress” resource.

This does not cancel the underlying operation; it only deletes the monitor. Every monitor that is created should be deleted, else they won't be freed by the process and they will accumulate, taking memory.

#### Query

```
DELETE <uri>
```

#### Example request

```
DELETE <uri> HTTP/1.1
Host: xivoserver
```

### Example response

```
HTTP/1.1 204 No Content
```

## Configuration Service

### Get the Configuration

#### Query

```
GET <uri>
```

**Example request** Example request for the configuration service of the *provd manager*.

```
GET /provd/configure HTTP/1.1
Host: xivoserver
Accept: application/vnd.proformatique.provd+json
```

### Example response

```
HTTP/1.1 200 OK
Content-Type: application/vnd.proformatique.provd+json

{
  "params": [

        "id": "locale",
        "links": [
            {
                "href": "/provd/configure/locale",
                "rel": "srv.configure.param"
            }
        ],
        "value": null
    },
    {
        "description": "Set to 1 if all the devices are behind a NAT.",
        "id": "NAT",
        "links": [
            {
                "href": "/provd/configure/NAT",
                "rel": "srv.configure.param"
            }
        ],
        "value": 0
    }
]
```

## Get the Value of a Parameter

### Query

```
GET <uri>
```

**Example request** Example request for the NAT option of the configuration service of the provd entry point.

```
GET /provd/configure/NAT HTTP/1.1
Host: xivoserver
Accept: application/vnd.proformatique.provd+json
```

### Example response

```
HTTP/1.1 200 OK
Content-Type: application/vnd.proformatique.provd+json

{
  "param": {
    "value": 0
  }
}
```

## Set the Value of a Parameter

### Query

```
PUT <uri>
```

**Example request** Example request for the NAT option of the configuration service of the *provd manager*.

```
PUT /provd/configure/NAT HTTP/1.1
Host: xivoserver
Content-Type: application/vnd.proformatique.provd+json

{
  "param": {
    "value": 1
  }
}
```

### Example response

```
HTTP/1.1 204 No Content
Content-Type: application/vnd.proformatique.provd+json
```

## Installation Service

### Get the Installation Service

### Query

```
GET <uri>
```

**Example request** Example request for the installation service of the *plugin manager*.

```
GET /provd/pg_mgr/install HTTP/1.1
Host: xivoserver
Accept: application/vnd.proformatique.provd+json
```

### Example response

```
HTTP/1.1 200 OK
Content-Type: application/vnd.proformatique.provd+json

{
  "links": [
    {
      "href": "/provd/pg_mgr/install/install",
      "rel": "srv.install.install"
    },
    {
      "href": "/provd/pg_mgr/install/uninstall",
      "rel": "srv.install.uninstall"
    },
    {
      "href": "/provd/pg_mgr/install/installed",
      "rel": "srv.install.installed"
    },
    {
      "href": "/provd/pg_mgr/install/installable",
```

```

        "rel": "srv.install.installable"
    },
    {
        "href": "/provd/pg_mgr/install/upgrade",
        "rel": "srv.install.upgrade"
    },
    {
        "href": "/provd/pg_mgr/install/update",
        "rel": "srv.install.update"
    }
]
}

```

The upgrade and update services are optional and not all installation service provide them.

## Install a Package

### Query

```
POST <uri>
```

**Example request** Example request for the installation service of the plugin manager.

```

POST /provd/pg_mgr/install/install HTTP/1.1
Host: xivoserver
Content-Type: application/vnd.proformatique.provd+json

{
    "id": "xivo-polycom-4.0.4"
}

```

### Example response

```

HTTP/1.1 201 Created
Location: /provd/pg_mgr/install/install/1
Content-Type: application/vnd.proformatique.provd+json

```

The URI returned in the Location header points to an *operation in progress* resource.

## Uninstall a Package

### Query

```
POST <uri>
```

**Example request** Example request for the installation service of the plugin manager.

```

POST /provd/pg_mgr/install/uninstall HTTP/1.1
Host: xivoserver
Content-Type: application/vnd.proformatique.provd+json

{
    "id": "xivo-polycom-4.0.4"
}

```

### Example response

```
HTTP/1.1 204 No Content
Content-Type: application/vnd.proformatique.provd+json
```

## Upgrade a Package

### Query

```
POST <uri>
```

**Example request** Example request for the installation service of the plugin manager.

```
POST /provd/pg_mgr/install/upgrade HTTP/1.1
Host: xivoserver
Content-Type: application/vnd.proformatique.provd+json

{
  "id": "xivo-polycom-4.0.4"
}
```

### Example response

```
HTTP/1.1 201 Created
Location: /provd/pg_mgr/install/upgrade/1
Content-Type: application/vnd.proformatique.provd+json
```

The URI returned in the `Location` header points to an *operation in progress* resource.

## Update the List of Installable Packages

### Query

```
POST <uri>
```

**Example request** Example request for the installation service of the plugin manager.

```
POST /provd/pg_mgr/install/update HTTP/1.1
Host: xivoserver
Content-Type: application/vnd.proformatique.provd+json

{}
```

### Example response

```
HTTP/1.1 201 Created
Location: /provd/pg_mgr/install/update/1
Content-Type: application/vnd.proformatique.provd+json
```

The URI returned in the `Location` header points to an *operation in progress* resource.

## List Installable Packages

### Query

```
GET <uri>
```

**Example request** Example request for the installation service of the plugin manager.

```
GET /provd/pg_mgr/install/installable HTTP/1.1
Host: xivoserver
Accept: application/vnd.proformatique.provd+json
```

**Example response**

```
HTTP/1.1 200 OK
Content-Type: application/vnd.proformatique.provd+json

{

```

## XiVO sysconfd API

This service provides a public API that can be used to change the configuration that are on a XiVO.

**Warning:** The 0.1 API is currently in development. Major changes could still happen and new resources will be added over time.

## API reference

## Asterisk Voicemail

## Delete voicemail

## Query

```
GET /delete_voicemail
```

## Parameters

## Mandatory

**name** the voicemail name

## Optional

**context** the voicemail context (default is 'default')

<b>Errors</b>	Error code	Error message	Description
	404	Not found	The voicemail does not exist

## Example requests

```
GET /delete_voicemail HTTP/1.1
Host: xivoserver
Accept: application/json
```

### Example response

```
HTTP/1.1 200 OK
Content-Type: application/json

{
  nothing
}
```

### Common configuration

## Apply configuration

### Query

```
GET /commonconf_apply
```

## Generate configuration

### Query

```
POST /commonconf_generate
```

## Dhcpd configuration

## Update configuration

### Query

```
GET /dhcpd_update
```

## Ethernet configuration

## Discover interfaces

### Query

```
GET /discover_netifaces
```

## Example request

```
GET /discover_netifaces HTTP/1.1
Host: xivoserver
Accept: application/json
```

## Example response

```
HTTP/1.1 200 OK
Content-Type: application/json

### Modify interface

#### Description

Field	Values	Description
iface	string	Interface name like eth0
method	list	static or dhcp
address	string	
netmask	string	
broadcast	string	
gateway	string	
mtu	int	
auto	boolean	
up	boolean	
options	list	dns-search and dns-nameservers

### Query

```
PUT /modify_physical_eth_ipv4
```

### Example request

```

PUT /modify_physical_eth_ipv4 HTTP/1.1
Host: xivoserver
Content-Type: application/json
{
  "ifname": "eth0",
  "method": "dhcp",
  "auto": "True"
}

```

### Replace virtual interface

### Query

```
PUT /replace_virtual_eth_ipv4
```

### Example request

```

PUT /replace_virtual_eth_ipv4 HTTP/1.1
Host: xivoserver
Content-Type: application/json
{
  "ifname": "eth0:0",

```

```
"new_ifname": "eth0:1",
"method": "dhcp",
"auto": "True"
}
```

## Modify interface

### Query

```
PUT /modify_eth_ipv4
```

### Example request

```
PUT /modify_eth_ipv4 HTTP/1.1
Host: xivoserver
Content-Type: application/json
{
  'ifname' : 'eth0'
  'address': '192.168.0.1',
  'netmask': '255.255.255.0',
  'broadcast': '192.168.0.255',
  'gateway': '192.168.0.254',
  'mtu': 1500,
  'auto': True,
  'up': True,
  'options': [['dns-search', 'toto.tld tutu.tld'],
              ['dns-nameservers', '127.0.0.1 192.168.0.254']]
}
```

## Change state

### Query

```
PUT /change_state_eth_ipv4
```

### Example request

```
PUT /change_state_eth_ipv4 HTTP/1.1
Host: xivoserver
Content-Type: application/json
{
  'ifname' : 'eth0',
  'state': True
}
```

## Delete interface ipv4

### Query

```
GET /delete_eth_ipv4/<interface>
```

### Example request

```
GET /delete_eth_ipv4/eth0 HTTP/1.1
Host: xivoserver
Content-Type: application/json
```

## HA configuration

### Get HA configuration

#### Query

```
GET /get_ha_config
```

### Update HA configuration

#### Query

```
POST /update_ha_config
```

## network configuration

### Get network configuration

#### Query

```
GET /network_config
```

### Rename ethernet interface

#### Query

```
POST /rename_ethernet_interface
```

### swap ethernet interface

#### Query

```
POST /swap_ethernet_interfaces
```

## Routes

#### Query

```
POST /routes
```

## OpenSSL configuration

### List certificates

#### Query

```
GET /openssl_listcertificates
```

### Get certificate infos

**Query**

```
GET /openssl_certificateinfos
```

**Export public key**

**Query**

```
GET /openssl_exportpubkey
```

**Export SSL certificate**

**Query**

```
GET /openssl_export
```

**Create CA certificate**

**Query**

```
POST /openssl_createcacertificate
```

**Create certificate**

**Query**

```
POST / openssl_createcertificate
```

**Delete certificate**

**Query**

```
GET /openssl_deletecertificate
```

**Import SSL certificate**

**Query**

```
POST /openssl_import
```

**DNS configuration**

**Host configuration**

**Query**

```
POST /hosts
```

**Resolv.conf configuration**

**Query**

```
POST /resolv_conf
```

### Services daemon

#### Reload services

##### Query

```
POST /services
```

### Xivo Services

#### Reload XiVO services

##### Query

```
POST /xivoctl
```

### Handlers

#### Execute handlers

##### Query

```
POST /exec_request_handlers
```

### Status check

#### Status

##### Query

```
GET /status_check
```

#### Example request

```
GET /status_check HTTP/1.1
Host: xivoserver
Content-Type: application/json
```

#### Example response

```
HTTP/1.1 200 OK
Content-Type: application/json
{
  "status": "up"
}
```

For other services, see <http://api.xivo.io>.

## Configuration

The REST API is available via HTTPS or HTTP on port offer by the daemon. Accessing to the REST API requires to create a webservice user in the web interface (Configuration/Management/Web Services Access):

- if an IP address is specified for the user, no authentication is needed
- if you choose not to specify an IP address for the user, you can connect to the REST API with a HTTP Digest authentication, using the user name and password you provided. For instance, the following command line allows to retrieve XiVO users through the REST API, using the login **admin** and the password **passadmin**:

```
curl --digest --insecure --cookie '' -u admin:passadmin https://<xivo_address>:9486/1.1/users
```

The REST API is also available on the loopback interface via HTTP on port 9487, with no authentication needed.

## HTTP status codes

Standard HTTP status codes are used. For the full definition see [IANA definition](#).

- 200: Success
- 201: Created
- 400: Incorrect syntax
- 404: Resource not found
- 406: Not acceptable
- 412: Precondition failed
- 415: Unsupported media type
- 500: Internal server error

## General URL parameters

All URL's starts by /1.1/, 1.1 is the current protocol version.

Example usage of general parameters:

```
GET http://127.0.0.1:9487/1.1/voicemails?limit=X&skip=Y
```

## Parameters

**order** Sort the list using a column (e.g. "number"). See specific resource documentation for columns allowed.

**direction** 'asc' or 'desc'. Sort list in ascending (asc) or descending (desc) order

**limit** total number of resources to show in the list. Must be a positive integer

**skip** number of resources to skip over before starting the list. Must be a positive integer

**search** Search resources. Only resources with a field containing the search term will be listed.

## Data representation

### Data retrieved from the REST server

JSON is used to encode returned or sent data. Therefore, the following headers are needed:

- **when the request is supposed to return JSON:** Accept = application/json
- **when the request's body contains JSON:** Content-Type = application/json

---

**Note:** Optional properties can be added without changing the protocol version in the main list or in the object list itself. Properties will not be removed, type and name will not be modified.

---

**Getting object lists** GET /1.1/objects

**When returning lists the format is as follows:**

- total - number of items in total in the system configuration (optional)
- items - returned data as an array of object properties list.

Other optional properties can be added later.

Response data format

```
{
  "total": 2,
  "items":
  [
    {
      "id": "1",
      "prop1": "test"
    },
    {
      "id": "2",
      "prop1": "ssd"
    }
  ]
}
```

**Getting An Object** Format returned is a list of properties. The object should always have the same attributes set, the default value being the equivalent to NULL in the content-type format.

GET /1.1/objects/<id>

Response data format

```
{
  "id": "1",
  "prop1": "test"
}
```

### Data sent to the REST server

The XiVO REST server implements POST and PUT methods for item creation and update respectively. Data is created using the POST method via a root URL and is updated using the PUT method via a root URL suffixed by /<id>. The server expects to receive JSON encoded data. Only one item can be processed per request. The data format and required data fields are illustrated in the following example:

Request data format

```
{
  "id": "1",
  "prop1": "test"
}
```

When updating, only the id and updated properties are needed, omitted properties are not updated. Some properties can also be optional when creating an object.

## Errors

A request to the web services may return an error. An error will always be associated to an HTTP error code, and eventually to one or more error messages. The following errors are common to all web services:

Error code	Error message	Description
406	empty	Accept header missing or contains an unsupported content type
415	empty	Content-Type header missing or contains an unsupported content type
500	list of errors	An error occurred on the server side; the content of the message depends of the type of errors which occurred

The 400, 404 and 412 errors depend on the web service you are requesting. They are separately described for each of them.

The error messages are contained in a JSON list, even if there is only one error message:

```
[ message_1, message_2, ... ]
```

## 1.11.5 Subroutine

### What is it ?

The preprocess subroutine allows you to enhance XiVO features through the Asterisk dialplan. Features that can be enhanced are :

- User
- Group
- Queue
- Meetme
- Incoming call
- Outgoing call

There are three possible categories :

- Subroutine for one feature
- Subroutine for global forwarding
- Subroutine for global incoming call to an object

### Adding new subroutine

If you want to add a new subroutine, we propose to edit a new configuration file in the directory `/etc/asterisk/extensions_extra.d`. You can also add this file by the web interface.

An example:

```
[myexemple]
exten = s,1,NoOp(This is an example)
same  = n,Return()
```

Don't forget to finish your subroutine by a `Return()`.

### Global subroutine

There is predefined subroutine for this feature, you can find the name and the activation in the `/etc/xivo/asterisk/xivo_globals.conf`. The variables are:

```
; Global Preprocess subroutine
XIVO_PRESUBR_GLOBAL_ENABLE = 1
XIVO_PRESUBR_GLOBAL_USER = xivo-subrgbl-user
XIVO_PRESUBR_GLOBAL_AGENT = xivo-subrgbl-agent
XIVO_PRESUBR_GLOBAL_GROUP = xivo-subrgbl-group
XIVO_PRESUBR_GLOBAL_QUEUE = xivo-subrgbl-queue
XIVO_PRESUBR_GLOBAL_MEETME = xivo-subrgbl-meetme
XIVO_PRESUBR_GLOBAL_DID = xivo-subrgbl-did
XIVO_PRESUBR_GLOBAL_OUTCALL = xivo-subrgbl-outcall
XIVO_PRESUBR_GLOBAL_PAGING = xivo-subrgbl-paging
```

So if you want to add a subroutine for all of your XiVO users you can do this:

```
[xivo-subrgbl-user]
exten = s,1,NoOp(This is an example for all my users)
same = n,Return()
```

## Forward subroutine

You can also use a global subroutine for call forward.

```
; Preprocess subroutine for forwards
XIVO_PRESUBR_FWD_ENABLE = 1
XIVO_PRESUBR_FWD_USER = xivo-subrfwd-user
XIVO_PRESUBR_FWD_GROUP = xivo-subrfwd-group
XIVO_PRESUBR_FWD_QUEUE = xivo-subrfwd-queue
XIVO_PRESUBR_FWD_MEETME = xivo-subrfwd-meetme
XIVO_PRESUBR_FWD_VOICEMAIL = xivo-subrfwd-voicemail
XIVO_PRESUBR_FWD_SCHEDULE = xivo-subrfwd-schedule
XIVO_PRESUBR_FWD_VOICEMENU = xivo-subrfwd-voicemenu
XIVO_PRESUBR_FWD_SOUND = xivo-subrfwd-sound
XIVO_PRESUBR_FWD_CUSTOM = xivo-subrfwd-custom
XIVO_PRESUBR_FWD_EXTENSION = xivo-subrfwd-extension
```

## Dialplan variables

Some of the XiVO variables can be used in subroutines.

```
XIVO_CALLORIGIN ; intern for internal calls, extern for external calls
```

# 1.12 Contributors

General information:

## 1.12.1 Contributing to the Documentation

XiVO documentation is generated with Sphinx. The source code is available on GitHub at <https://github.com/xivo-pbx/xivo-doc>

Provided you already have Python installed on your system. You need first to install **Sphinx** : `easy_install -U Sphinx`<sup>1</sup>.

Quick Reference

- <http://docutils.sourceforge.net/docs/user/rst/cheatsheet.txt>
- <http://docutils.sourceforge.net/docs/user/rst/quickref.html>

<sup>1</sup> `easy_install` can be found in the debian package `python-setuptools` : `sudo apt-get install python-setuptools`

- [http://openalea.gforge.inria.fr/doc/openalea/doc/\\_build/html/source/sphinx/rest\\_syntax.html](http://openalea.gforge.inria.fr/doc/openalea/doc/_build/html/source/sphinx/rest_syntax.html)

### Documentation guideline

Here's the guideline/conventions to follow for the XiVO documentation.

### Language

The documentation must be written in english, and only in english.

### Sections

The top section of each file must be capitalized using the following rule: capitalization of all words, except for articles, prepositions, conjunctions, and forms of to be.

Correct:

```
The Vitamins are in My Fresh California Raisins
```

Incorrect:

```
The Vitamins Are In My Fresh California Raisins
```

Use the following punctuation characters:

- \* with overline, for “file title”
- =, for sections
- -, for subsections
- ^, for subsubsections

Punctuation characters should be exactly as long as the section text.

Correct:

```
Section1  
=====
```

Incorrect:

```
Section2  
=====
```

There should be 2 empty lines between sections, except when an empty section is followed by another section.

Correct:

```
Section1  
=====
```

Foo.

```
Section2  
=====
```

Bar.

Correct:

```

Section1
=====

Foo.

.. _target:

Section2
=====

Bar.

```

**Correct:**

```

Section1
=====

Subsection1
-----

Foo.

```

**Incorrect:**

```

Section1
=====

Foo.

Section2
=====

Bar.

```

## Lists

**Bullet lists:**

```

* First item
* Second item

```

**Autonumbered lists:**

```

#. First item
#. Second item

```

## Literal blocks

Use `::` on the same line as the line containing text when possible.

The literal blocks must be indented with three spaces.

**Correct:**

```

Bla bla bla::
    apt-get update

```

**Incorrect:**

```
Bla bla bla:

::

    apt-get update
```

### Inline markup

Use the following roles when applicable:

- `:file:` for file, i.e.:

```
The :file:`/dev/null` file.
```

- `:menuselection:` for the web interface menu:

```
The :menuselection:`Configuration --> Management --> Certificates` page.
```

- `:guilabel:` for designating a specific GUI element:

```
The :guilabel:`Action` column.
```

### Others

- There must be no warning nor error messages when building the documentation with `make html`.
- There should be one and only one newline character at the end of each file
- There should be no trailing whitespace at the end of lines
- Paragraphs must be wrapped and lines should be at most 100 characters long

## 1.12.2 Debugging Asterisk

### Precondition

To debug asterisk crashes or freezes, you need the following debug packages on your XiVO:

General rule	XiVO < 14.18	XiVO >= 14.18
Example version	14.12	14.18
Commands	<pre>apt-get install xivo-fai-14.12 apt-get update apt-get install gdb apt-get install -t xivo-14.12 asteriskdbg-xivo-14.12</pre>	<pre>apt-get install xivo-14.18 apt-get update apt-get install gdb apt-get install asteriskdbg-xivo-14.18</pre>

### So There is a Problem with Asterisk. Now What ?

1. Find out the time of the incident from the people most likely to know
2. Determine if there was a segfault
  - (a) The command `grep segfault /var/log/syslog` should return a line such as the following:

```
Oct 16 16:12:43 xivo-1 kernel: [10295061.047120] asterisk[1255]: segfault at e ip b751aa6
```

- (b) Note the exact time of the incident from the segfault line.
- (c) Follow the [Debugging Asterisk Crash](#) procedure.

3. If you observe some of the following common symptoms, follow the *Debugging Asterisk Freeze* procedure.

- The output of command `service asterisk status` says Asterisk PBX is running.
- No more calls are distributed and phones go to No Service.
- Command `core show channels` returns only headers (no data) right before returning

4. Fetch Asterisk logs for the day of the crash (make sure file was not already logrotated):

```
cp -a /var/log/asterisk/full /var/local/`date +"%Y%m%d"`-`hostname`-asterisk-full.log
```

5. Fetch xivo-ctid logs for the day of the crash (make sure file was not already logrotated):

```
cp -a /var/log/xivo-ctid.log /var/local/`date +"%Y%m%d"`-`hostname`-xivo-ctid.log
```

6. Open a new issue on the [bugtracker](#) with following information

- Tracker: Bug
- Status: New
- Category: Asterisk
- In versions: The version of your XiVO installation where the crash/freeze happened
- Subject: Asterisk Crash or Asterisk Freeze
- Description : Add as much context as possible, if possible, a scenario that lead to the issue, the date and time of issue, where we can fetch logs and backtrace
- Attach logs and backtrace (if available) to the ticket (issue must be saved, then edited and files attached to a comment).

## Debugging Asterisk Crash

When asterisk crashes, it usually leaves a core file in `/var/spool/asterisk/`.

You can create a backtrace from a core file named `core_file` with:

```
gdb -batch -ex "bt full" -ex "thread apply all bt" asterisk core_file > bt-threads.txt
```

## Debugging Asterisk Freeze

You can create a backtrace of a running asterisk process with:

```
gdb -batch -ex "thread apply all bt" asterisk $(pidof asterisk) > bt-threads.txt
```

If your version of asterisk has been compiled with the `DEBUG_THREADS` flag, you can get more information about locks with:

```
asterisk -rx "core show locks" > core-show-locks.txt
```

---

**Note:** Debugging freeze without this information is usually a lot more difficult.

---

Optionally, other information that can be interesting:

- the output of `asterisk -rx 'core show channels'`
- the verbose log of asterisk just before the freeze

## Recompiling Asterisk

It's relatively straightforward to recompile the asterisk version of your XiVO with the `DEBUG_THREADS` and `DONT_OPTIMIZE` flag, which make debugging an asterisk problem easier.

The steps are:

1. Uncomment the `deb-src` line for the XiVO sources:

```
sed -i 's/^# *deb-src/deb-src/' /etc/apt/sources.list.d/xivo*
```

2. Fetch the asterisk source package:

```
mkdir -p ~/ast-rebuild
cd ~/ast-rebuild
apt-get update
apt-get install build-essential
apt-get source asterisk
```

3. Install the build dependencies:

```
apt-get build-dep asterisk
```

4. Enable the `DEBUG_THREADS` and `DONT_OPTIMIZE` flag:

```
cd <asterisk-source-folder>
vim debian/rules
```

5. Update the changelog by appending `+debug1` in the package version:

```
vim debian/changelog
```

6. Rebuild the asterisk binary packages:

```
dpkg-buildpackage -us -uc
```

This will create a couple of `.deb` files in the parent directory, which you can install via `dpkg`.

## Running Asterisk under Valgrind

1. Install valgrind:

```
apt-get install valgrind
```

2. Recompile asterisk with the `DONT_OPTIMIZE` flag.
3. Edit `/etc/asterisk/modules.conf` so that asterisk doesn't load unnecessary modules. This step is optional. It makes asterisk start (noticeably) faster and often makes the output of valgrind easier to analyze, since there's less noise.
4. Edit `/etc/asterisk/asterisk.conf` and comment the `highpriority` option. This step is optional.
5. Stop monit and asterisk:

```
monit quit
service asterisk stop
```

6. Stop all unneeded XiVO services. For example, it can be useful to stop `xivo-ctid`, so that it won't interact with asterisk via the AMI.
7. Copy the `valgrind.supp` file into `/tmp`. The `valgrind.supp` file is located in the `contrib` directory of the asterisk source code.
8. Execute valgrind in the `/tmp` directory:

```
cd /tmp
valgrind --leak-check=full --log-file=valgrind.txt --suppressions=valgrind.supp --vgdb=no ast
```

Note that when you terminate asterisk with Control-C, asterisk does not unload the modules before exiting. What this means is that you might have lots of “possibly lost” memory errors due to that. If you already know which modules is responsible for the memory leak/bug, you should explicitly unload it before terminating asterisk.

It is suggested to have 768 MiB of RAM or more, since running asterisk under valgrind takes a lots of extra memory.

## 1.12.3 Debugging Daemons

Here’s how to run the various daemons present in XiVO in foreground and debug mode.

Note that it’s usually a good idea to stop monit before running a daemon in foreground.

### agentd

```
xivo-agentd -f -v
```

- -f for foreground
- -v for verbose

Log file: /var/log/xivo-agentd.log

```
2013-10-29 11:03:55,799 [25830] (INFO): Starting xivo-agentd
2013-10-29 11:03:58,632 [25830] (INFO): Executing statuses command
```

### agid

```
xivo-agid -f -d
```

- -f for foreground
- -d for debug

Log file: /var/log/xivo-agid.log

```
2014-06-18 11:01:02,816 [28779] (INFO) (xivo_agid.agid): xivo-agid starting...
2014-06-18 11:01:04,479 [28779] (INFO) (xivo_agid.modules.callerid_forphones): executing update c
2014-06-18 11:01:04,877 [28779] (INFO) (xivo_agid.modules.callerid_forphones): executing update c
```

### amid

```
xivo-amid -f -v
```

- -f for foreground
- -v for verbose

Log file: /var/log/xivo-amid.log

```
2014-01-15 10:36:42,372 [5252] (INFO): Starting xivo-amid
2014-01-15 10:36:42,372 [5252] (INFO): Connecting socket
2014-01-15 10:36:42,372 [5252] (INFO): Connecting AMI client to localhost:5038
```

## **call-logd**

```
xivo-call-logd -f -v
```

- -f for foreground
- -v for verbose

Log file: /var/log/xivo-call-logd.log

```
2014-02-12 14:58:05,051 [14650] (INFO): Starting xivo-call-logd
2014-02-12 14:58:05,178 [14650] (INFO): Running...
```

## **confgend**

```
twistd -no --python=/usr/bin/xivo-confgend
```

No debug mode in confgend.

Log file: /var/log/xivo-confgend.log

```
2013-10-29 11:03:50-0400 [-] Starting factory <xivo_confgen.confgen.ConfgendFactory instance at 0
2013-10-29 11:03:55-0400 [Confgen,0,127.0.0.1] serving asterisk/features.conf
2013-10-29 11:03:55-0400 [Confgen,1,127.0.0.1] serving asterisk/musiconhold.conf
```

## **ctid**

```
xivo-ctid -f -d
```

- -d for debug
- -f for foreground

Log file: /var/log/xivo-ctid.log

```
2013-10-29 11:03:58,789 xivo-ctid[25914] (INFO) (main): CTI Fully Booted in 0.660311 seconds
2013-10-29 11:03:58,789 xivo-ctid[25914] (INFO) (interface_ami): Asterisk Call Manager/1.3
2013-10-29 11:03:58,827 xivo-ctid[25914] (INFO) (AMI logger): Event received:Privilege=>system,al
```

## **dxtora**

```
dxtora -f
```

- -f for foreground

Log file: /var/log/xivo-dxtora.log

```
2014-06-18 13:20:17,322 [24028] (INFO) (xivo-dxtora): Pulling DHCP info from unix socket
```

## **provd**

```
twistd -no -r epoll xivo-provd -s -v
```

- -s for logging to stderr

- -v for verbose

Log file: /var/log/xivo-provd.log

```
2014-06-18 12:04:54,299 [8564] (INFO) (provd.main): Binding HTTP REST API service to "0.0.0.0:8666"
2014-06-18 12:04:54,320 [8564] (INFO) (twisted): Site starting on 8666
```

## confd

```
xivo-confd -f -d
```

- -f for foreground
- -d for debug messages

Log file: /var/log/xivo-confd.log

```
2013-10-28 10:02:00,352 xivo-confd[8905] (INFO) (xivo_confd.flask_http_server): POST http://127.0.0.1:8666/
2013-10-28 10:04:35,815 xivo-confd[8905] (INFO) (xivo_confd.flask_http_server): GET http://127.0.0.1:8666/
```

## sysconfd

```
xivo-sysconfd -l debug -f
```

- -l debug for debug level logging
- -f for foreground

Log file: /var/log/xivo-sysconfd.log

```
2014-06-18 12:00:23,221 [8277] (INFO) (xivo-sysconfd): locking PID
2014-06-18 12:00:23,233 [8277] (INFO) (xivo-sysconfd): pidfile ok
2014-06-18 12:00:23,237 [8277] (INFO) (http_json_server): will now serve
```

## 1.12.4 XiVO Guidelines

### Inter-process communication

Our current goal is to use only two means of communication between XiVO processes:

- a REST API over HTTP for synchronous commands
- a software bus (RabbitMQ) for asynchronous events

Each component should have its own REST API and its own events and can communicate with every other component from across a network only via those means.

### Service API

The current [xivo-dao](#) Git repository contains the basis of the future services Python API. The API is split between different resources available in XiVO, such as users, groups, schedules... For each resource, there are different modules :

- service: the public module, providing possible actions. It contains only business logic and no technical logic. There must be no file name, no SQL queries and no URLs in this module.
- dao: the private Data Access Object. It knows where to get data and how to update it, such as SQL queries, file names, URLs, but has no business logic.
- model: the public class used to represent the resource. It must be self-contained and have almost no methods, except for computed fields based on other fields in the same object.

- notifier: private, it knows to whom and in which format events must be sent.
- validator: private, it checks input parameters from the service module.

## Definition of XiVO Daemon

The goal is to make XiVO as elastic as possible, i.e. the XiVO services need to be able to run on separate machines and still talk to each other.

To be in accordance with our goal, a XiVO daemon must (if applicable):

- Offer a REST API (with encryption, authentication and accepting cross-site requests)
- Be able to read and send events on a software bus
- Be able to run inside a container, such as Docker, and be separated from the XiVO server
- Offer a configuration file in YAML format.
- Access the XiVO database through the `xivo-dao` library
- Have a configurable level of logging
- Have its own log file
- Be extendable through the use of plugins
- Not run with system privileges
- Be installable from source

Currently, none of the XiVO daemons meet these expectations; it is a work in progress.

A daemon scaffold can be found in the [XiVO Daemon Skeleton](#) section

## 1.12.5 Profiling Python Programs

### Profiling CPU/Time Usage

Here's an example on how to profile `xivo-ctid` for CPU/time usage:

1. Stop the monit daemon:

```
service monit stop
```

2. Stop the process you want to profile, i.e. `xivo-ctid`:

```
service xivo-ctid stop
```

3. Start the service in foreground mode running with the profiler:

```
python -m cProfile -o test.profile /usr/bin/xivo-ctid -f
```

This will create a file named `test.profile` when the process terminates.

Note that profiling multi-threaded program (`xivo-agid`, `xivo-confd`) doesn't work reliably.

The [Debugging Daemons](#) section documents how to launch the various XiVO services in foreground/debug mode.

4. Examine the result of the profiling:

```
$ python -m pstats test.profile
Welcome to the profile statistics browser.
% sort time
% stats 15
...
```

```
% sort cumulative
% stats 15
```

## Measuring Code Coverage

Here's an example on how to measure the code coverage of xivo-ctid.

This can be useful when you suspect a piece of code to be unused and you want to have additional information about it.

1. Install the following packages:

```
apt-get install python-pip build-essential python-dev
```

2. Install coverage via pip:

```
pip install coverage
```

3. Run the program in foreground mode with `coverage run`:

```
service monit stop
service xivo-ctid stop
coverage erase
coverage run /usr/bin/xivo-ctid -f
```

The *Debugging Daemons* section documents how to launch the various XiVO service in foreground/debug mode.

4. After the process terminates, use `coverage html` to generate an HTML coverage report:

```
coverage html --include='*xivo_cti*'
```

This will generate an `htmlcov` directory in the current directory.

5. Browse the coverage report.

Either copy the directory onto your computer and open it with a web browser, or start a web server on the XiVO:

```
cd htmlcov
python -m SimpleHTTPServer
```

Then open the page from your computer (i.e. not on the xivo):

```
firefox http://<xivo-hostname>:8000
```

## 1.12.6 Translating XiVO

French and English are maintained by Avencall. Other languages are provided by the community.

## Asterisk and XiVO Prompts

Avenccall is in contact with several studios for different languages and prompts. The information for those languages are :

- French : Super Sonic productions ([supersonicprod@wanadoo.fr](mailto:supersonicprod@wanadoo.fr))
- English : Asterisk voice ([allison@theasteriskvoice.com](mailto:allison@theasteriskvoice.com))
- German : ATS studio
- Italian : ATS studio

Prompts transcripts are listed in [Transifex \(\\*-prompts\)](#). You may translate them there.

The prompts used in XiVO are stored in [xivo-sounds](#) git repository.

## XiVO Client

All translations are in [Transifex \(xivo-client\)](#). The source language is English. Translations are synchronised with the code before every release.

## Web Interface

Translations are currently available in French and English. There are no plans to translate the Web interface in other languages.

## 1.12.7 Style Guide

### Syntax

### License

Python files start with a UTF8 encoding comment and the GPLv3 license. A blank line should separate the license from the imports

Example:

```
# -*- coding: utf-8 -*-

# Copyright (C) 2013 Avenccall
#
# This program is free software: you can redistribute it and/or modify
# it under the terms of the GNU General Public License as published by
# the Free Software Foundation, either version 3 of the License, or
# (at your option) any later version.
#
# This program is distributed in the hope that it will be useful,
# but WITHOUT ANY WARRANTY; without even the implied warranty of
# MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the
# GNU General Public License for more details.
#
# You should have received a copy of the GNU General Public License
# along with this program. If not, see <http://www.gnu.org/licenses/>

import argparse
```

## Spacing

- Lines should not go further than 80 to 100 characters.
- In python, indentation blocks use 4 spaces
- In PHP, indentation blocks use tabs
- Imports should be ordered alphabetically
- Separate module imports and `from` imports with a blank line

Example:

```
import argparse
import datetime
import os
import re
import shutil
import tempfile

from StringIO import StringIO
from urllib import urlencode
```

## PEP8

When possible, use pep8 to validate your code. Generally, the following errors are ignored :

- E501 (max 80 chars per line)

Example:

```
pep8 --ignore=E501 xivo_cti
```

When possible, avoid using backslashes to separate lines.

Bad Example:

```
user = session.query(User).filter(User.firstname == firstname)\
                               .filter(User.lastname == lastname)\
                               .filter(User.number == number)\
                               .all()
```

Good Example:

```
user = (session.query(User).filter(User.firstname == firstname)
        .filter(User.lastname == lastname)
        .filter(User.number == number)
        .all())
```

## Strings

Avoid using the `+` operator for concatenating strings. Use string interpolation instead.

Bad Example:

```
phone_interface = "SIP" + "/" + username + "-" + password
```

Good Example:

```
phone_interface = "SIP/%s-%s" % (username, password)
```

## Comments

Redundant comments should be avoided. Instead, effort should be put on making the code clearer.

Bad Example:

```
#Add the meeting to the calendar only if it was created on a week day
#(monday to friday)
if meeting.day > 0 and meeting.day < 7:
    calendar.add(meeting)
```

Good Example:

```
def created_on_week_day(meeting):
    return meeting.day > 0 and meeting.day < 7

if created_on_week_day(meeting):
    calendar.add(meeting)
```

## Conditions

Avoid using parenthesis around if statements, unless the statement expands on multiple lines or you need to nest your conditions.

Bad Examples:

```
if(x == 3):
    print "condition is true"

if(x == 3 and y == 4):
    print "condition is true"
```

Good Examples:

```
if x == 3:
    print "condition is true"

if x == 3 and y == 4:
    print "condition is true"

if (extremely_long_variable == 3
    and another_long_variable == 4
    and yet_another_variable == 5):

    print "condition is true"

if (2 + 3 + 4) - (1 + 1 + 1) == 6:
    print "condition is true"
```

Consider refactoring your statement into a function if it becomes too long, or the meaning isn't clear.

Bad Example:

```
if price * tax - bonus / reduction + fee < money:
    product.pay(money)
```

Good Example:

```
def calculate_price(price, tax, bonus, reduction, fee):
    return price * tax - bonus / reduction + fee

final_price = calculate_price(price, tax, bonus, reduction, fee)
```

```
if final_price < money:
    product.pay(money)
```

## Naming

- Class names are in CamelCase
- File names are in lower\_underscore\_case

Conventions for functions prefixed by *find*:

- Return None when nothing is found
- Return an object when a single entity is found
- Return the first element when multiple entities are found

Example:

```
def find_by_username(username):
    users = [user1, user2, user3]
    user_search = [user for user in users if user.username == username]

    if len(user_search) == 0:
        return None

    return user_search[0]
```

Conventions for functions prefixed by *get*:

- Raise an Exception when nothing is found
- Return an object when a single entity is found
- Return the first element when multiple entities are found

Example:

```
def get_user(userid):
    users = [user1, user2, user3]
    user_search = [user for user in users if user.userid == userid]

    if len(user_search) == 0:
        raise UserNotFoundError(userid)

    return user_search[0]
```

Conventions for functions prefixed by *find\_all*:

- Return an empty list when nothing is found
- Return a list of objects when multiple entites are found

Example:

```
def find_all_users_by_username(username):
    users = [user1, user2, user3]
    user_search = [user for user in users if user.username == username]

    return user_search
```

## Magic numbers

Magic numbers should be avoided. Arbitrary values should be assigned to variables with a clear name

Bad example:

```
class TestRanking(unittest.TestCase):

    def test_ranking(self):
        rank = Rank(1, 2, 3)

        self.assertEqual(rank.position, 1)
        self.assertEqual(rank.grade, 2)
        self.assertEqual(rank.session, 3)
```

Good example:

```
class TestRanking(unittest.TestCase):

    def test_ranking(self):
        position = 1
        grade = 2
        session = 3

        rank = Rank(position, grade, session)

        self.assertEqual(rank.position, position)
        self.assertEqual(rank.grade, grade)
        self.assertEqual(rank.session, session)
```

## Tests

Tests for a package are placed in their own folder named “tests” inside the package.

Example:

```
package1/
__init__.py
mod1.py
tests/
    __init__.py
    test_mod1.py
package2/
__init__.py
mod9.py
tests/
    __init__.py
    test_mod9.py
```

Unit tests should be short, clear and concise in order to make the test easy to understand. A unit test is separated into 3 sections :

- Preconditions / Preparations
- Thing to test
- Assertions

Sections are separated by a blank line. Sections that become too big should be split into smaller functions.

Example:

```
class UserTestCase(unittest.TestCase):

    def test_fullname(self):
        user = User(firstname='Bob', lastname='Marley')
        expected = 'Bob Marley'

        fullname = user.fullname()
```

```

        self.assertEqual(expected, fullname)

    def _prepare_expected_user(self, firstname, lastname, number):
        user = User()
        user.firstname = firstname
        user.lastname = lastname
        user.number = number

        return user

    def _assert_users_are_equal(self, expected_user, actual_user):
        self.assertEqual(expected_user.firstname, actual_user.firstname)
        self.assertEqual(expected_user.lastname, actual_user.lastname)
        self.assertEqual(expected_user.number, actual_user.number)

    def test_create_user(self):
        expected = self._prepare_expected_user('Bob', 'Marley', '4185551234')

        user = create_user('Bob', 'Marley', '4185551234')

        self._assert_users_are_equal(expected, user)

```

## Exceptions

Exceptions should not be used for flow control. Raise exceptions only for edge cases, or when something that isn't usually expected happens.

Bad Example:

```

def is_user_available(user):
    if user.available():
        return True
    else:
        raise Exception("User isn't available")

try:
    is_user_available(user)
except Exception:
    disable_user(user)

```

Good Example:

```

def is_user_available(user):
    if user.available():
        return True
    else:
        return False

if not is_user_available(user):
    disable_user(user)

```

Avoid throwing Exception. Use one of Python's built-in Exceptions, or create your own custom Exception. A list of exceptions is available on [the Python documentation website](#).

Bad Example:

```

def get_user(userid):
    user = session.query(User).get(userid)

    if not user:
        raise Exception("User not found")

```

Good Example:

```
class UserNotFoundError(LookupError):

    def __init__(self, userid):
        message = "user with id %s not found" % userid
        LookupError.__init__(self, message)

def get_user(userid):
    user = session.query(User).get(userid)

    if not user:
        raise UserNotFoundError(userid)
```

Never use `except:` without specifying any exception type. The reason is that it will also catch important exceptions, such as `KeyboardInterrupt` and `OutOfMemory` exceptions, making your program unstoppable or continuously failing, instead of stopping when wanted.

Bad Example:

```
try:
    get_user(user_id)
except:
    logger.exception("There was an error")
```

Good Example:

```
try:
    get_user(user_id)
except UserNotFoundError as e:
    logger.error(e.message)
    raise
```

## 1.12.8 Network

### Configuration for daemon

Network Flow table (IN) :

Daemon Name	Service	Protocol	Port	Listen	Authentication	Enabled
.	ICMP	ICMP	.	0.0.0.0	no	yes
postfix	SMTP	TCP	25	0.0.0.0	yes	yes
isc-dhcpd	DHCP	UDP	67	0.0.0.0	no	no
isc-dhcpd	DHCP	UDP	68	0.0.0.0	no	no
xivo-provd	TFTP	UDP	69	0.0.0.0	no	yes
ntpd	NTP	UDP	123	0.0.0.0	yes	yes
monit	HTTP	TCP	2812	127.0.0.1	no	yes

## 1.12.9 XiVO Package File Structure

### Package naming

Let's assume we want to organise the files for xivo-confd.

- Git repo name: xivo-confd
- Binary file name: xivo-confd
- Python package name: xivo\_confd

```
xivo-confd
|-- bin
|   |-- xivo-confd
|-- contribs
|   |-- docker
|       |-- ...
|       |-- prod
|       |-- ...
|-- debian
|   |-- ...
|-- Dockerfile
|-- docs
|   |-- ...
|-- etc
|   |-- ...
|-- integration-tests
|   |-- ...
|-- LICENSE
|-- README.md
|-- requirements.txt
|-- setup.cfg
|-- setup.py
|-- test-requirements.txt
|-- .travis.yml
```

```
`-- xivo-confd
  |-- ...
```

### Sources

**etc/** Contains default configuration files.

**docs/** Contains technical documentation for this package: API doc, architecture doc, diagrams, ... Should be in RST format using Sphinx.

**bin/** Contains the binaries. Not applicable for pure libraries.

**integration-tests/** Contains the tests bigger than unit-tests. Tests should be runnable simply, e.g. `nosetests integration-tests`.

**README.md** Read me in markdown (Github flavor).

**LICENSE** License (GPLv3)

**.travis.yml** Travis CI configuration file

### Python

Standard files:

- `setup.py`
- `setup.cfg`
- `requirements.txt`
- `test-requirements.txt`
- `xivo-confd/` (the main sources)

### Debian

**debian/** Contains the Debian packaging files (`control`, `rules`, ...)

### Docker

**Dockerfile** Used to build a docker image for a working production version

**contribs/docker/prod/** Contains the files necessary for running xivo-confd inside a production Docker image

**contribs/docker/other/** Contains the Dockerfile and other files to run xivo-confd inside Docker with specific configuration

### File naming

- PID file: `/var/run/xivo-confd/xivo-confd.pid`
- WSGI socket file: `/var/run/xivo-confd/xivo-confd.sock`
- Config file: `/etc/xivo-confd/config.yml`
- Log file: `/var/log/xivo-confd.log`
- Static data files: `/usr/share/xivo-confd`
- Storage data files: `/var/lib/xivo-confd`

Component specific information:

### 1.12.10 CTI Server

This section describes the informations and tools for CTI Server.

#### CTI Proxy

Here's how to run the various CTI client-server development/debugging tools. These tools can be found on GitHub, in the [XiVO project](#).

You can get the scripts by using Git:

```
$ git clone https://github.com/xivo-pbx/xivo-tools.git
```

#### General Information

Both the `ctispy`, `ctisave` and `ctistat` tools work in a similar way. They both are proxies that need to be inserted between the CTI client and the CTI server message flow.

To do this, you first start the given tool on your development machine, giving it the CTI server hostname as the first argument. You then configure your CTI client to connect to the tool on port 50030 (notice the trailing 0). The tool should then accept the connection from the client, and once this is done, will make a connection to the server, thereby being able to process all the information sent between the client and the server.

In the following examples, we suppose that the CTI server is located on the host named `xivo-new`.

#### Tools

**ctispy** `ctispy` can be used to see the message flow between the client and the server in “real-time”.

The simplest invocation is:

```
$ cti-proxy/ctispy xivo-new
```

You can pretty-print the messages if you want by using the `--pretty-print` option:

```
$ cti-proxy/ctispy xivo-new --pretty-print
```

By default, each message is displayed separately even though more than one message can be in a single TCP packet. You can also use the `--raw` option if you want to see the raw traffic between the client and the server:

```
$ cti-proxy/ctispy xivo-new --raw
```

Note that when using the `--raw` option, some other option doesn't work because the messages are not decoded/analyzed.

If you want to remove some fields from the messages, you can use the `--strip` option:

```
$ cti-proxy/ctispy xivo-new --strip timenow --strip commandid --strip replyid
```

If you want to see only messages matching a certain key and value, use the `--include` option:

```
$ cti-proxy/ctispy xivo-new --include class=getlist
```

Finally, you can ignore all the messages from the client or the server by using the `--no-client` or `--no-server` option respectively.

By default, `ctispy` will exit after the connection with the client is closed. You can bypass this behavior with the `--loop` option, that will make the CTI proxy continue, whether the client is connected or not.

**ctisave** ctisave save the messages from the client and the server in two separate files. This is useful to do more careful post-analysis.

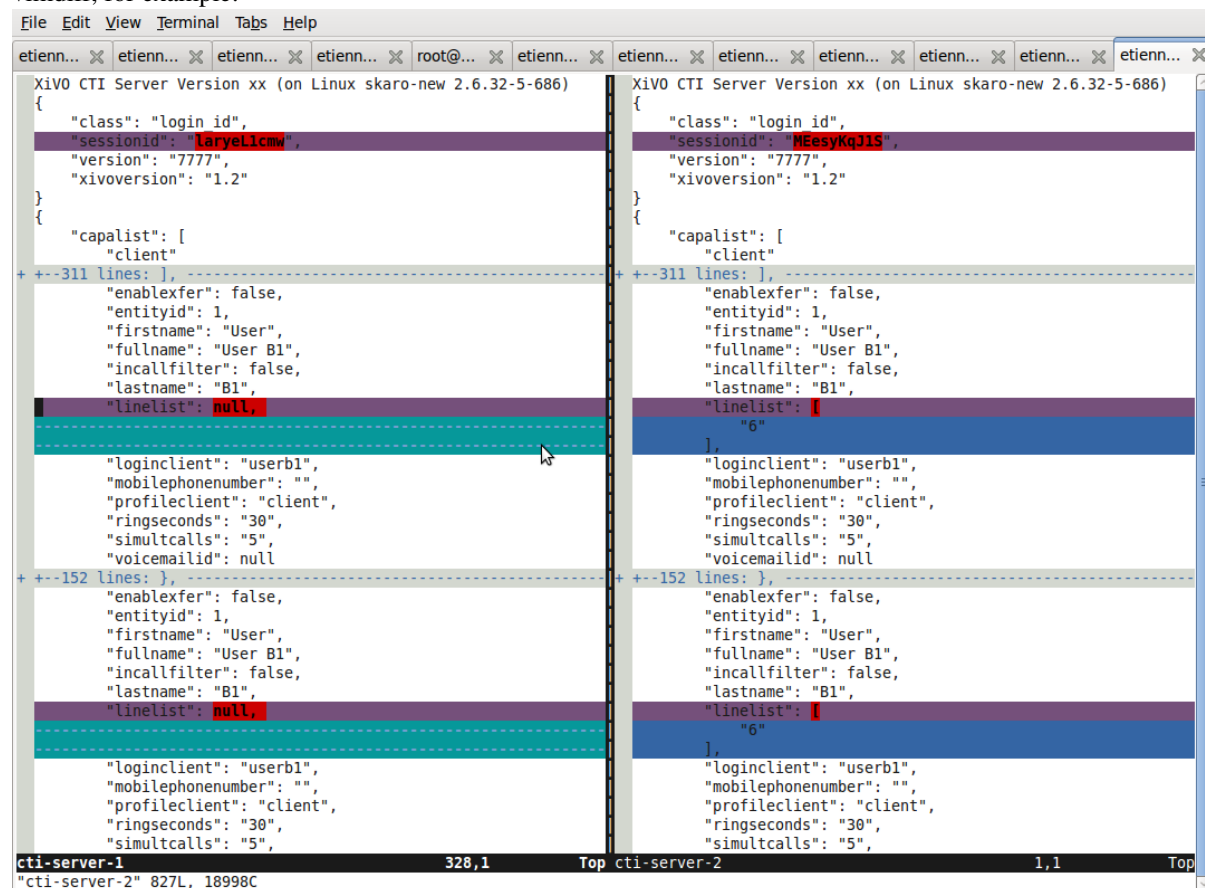

The simplest invocation is:

```
$ cti-proxy/ctisave xivo-new /tmp/cti-client /tmp/cti-server
```

To do comparison, it's often useful to strip some fields:

```
$ cti-proxy/ctisave xivo-new /tmp/cti-client /tmp/cti-server --strip timenow
--strip commandid --strip replyid
```

One useful thing to do with files generated from different ctisave invocation is to compare them with a tool like vimdiff, for example:

**ctistat** ctistat display various statistic about a CTI “session” when it ends.

The simplest invocation is:

```
$ cti-proxy/ctistat xivo-new
```

## CTI Protocol

### Protocol Changelog

**Warning:** The CTI server protocol is subject to change without any prior warning. If you are using this protocol in your own tools please be sure to check that the protocol did not change before upgrading XiVO

**15.12**

- `people_search_result` has a new key in relations: `source_entry_id`
- the `people_favorites` message was added.
- the `people_set_favorite` message was added.

**15.11**

- the `fax_progress` message was added.

**15.09**

- for messages of class `history` the client cannot request by mode anymore. The server returns all calls and the mode is now metadata for each call.

**14.24**

- for messages of class `ipbxcommand`, the `command record` and `sipnotify` have been removed.
- the `logfromclient` message has been removed

**14.22**

- for messages of class `faxsend`, the steps `file_decoded` and `file_converted` have been removed.

**14.06**

- the `dial_success` message was added

**14.05**

- the `unhold_switchboard` command was renamed `resume_switchboard`.

**13.22**

- the `actionfiche` message was renamed `call_form_result`.

**13.17**

- for messages of class `login_capas` from server to client: the key `presence` has been removed.

**13.14**

- for messages of class `getlist`, list agents and function `updatestatus`: the key `availability` in the `status` object/dictionary has changed values:
  - deleted values: `on_call_non_acd_incoming` and `on_call_non_acd_outgoing`
  - added values: `* on_call_non_acd_incoming_internal *`  
`on_call_non_acd_incoming_external * on_call_non_acd_outgoing_internal`  
`* on_call_non_acd_outgoing_external`

### 13.12

- for messages of class `getlist`, list agents and function `updatestatus`: the key availability in the status object/dictionary has changed values:
  - deleted value: `on_call_non_acd`
  - added values: `on_call_non_acd_incoming` and `on_call_non_acd_outgoing`

### 13.10

- for messages of class `getlist` and function `updateconfig`, the config object/dictionary does not have a `rules_order` key anymore.

## Commands

Objects have the format: “<type>:<xivoid>/<typeid>”

- <type> can take any of the following values: user, agent, queue, phone, group, meetme, ...
- <xivoid> indicates on which server the object is defined
- <typeid> is the object id, type dependant

**e.g.** user:xivo-test/5 I’m looking for the user that has the ID 5 on the xivo-test server.

Here is a non exhaustive list of types:

- exten
- user
- vm\_consult
- voicemail

## Agent

**Login agent** Client -> Server

```
{ "agentphonenumber": "1000", "class": "ipbxcommand", "command": "agentlogin", "commandid": 733366 }
```

agentphonenumber is the physical phone set where the agent is going to log on.

Server > Client

- Login successful :

```
{ "function": "updateconfig", "listname": "queuemembers", "tipbxid": "xivo",
  "timenow": 1362664323.94, "tid": "Agent/2002,blue",
  "config": { "paused": "0", "penalty": "0", "membership": "static", "status": "1", "lastcall": "0",
    "interface": "Agent/2002", "queue_name": "blue", "callstaken": "0" },
  "class": "getlist"
}

{ "function": "updatestatus", "listname": "agents", "tipbxid": "xivo",
  "timenow": 1362664323.94,
  "status": { "availability_since": 1362664323.94,
    "queues": [], "phonenumber": "1001", "on_call": false, "groups": [],
    "availability": "available", "channel": null },
  "tid": 7, "class": "getlist"
}
```

- The phone number is already used by an other agent :

```
{ "class": "ipbxcommand", "error_string": "agent_login_exten_in_use", "timenow": 1362664158.14 }
```

**Logout agent** Client -> Server

```
{ "class": "ipbxcommand", "command": "agentlogout", "commandid": 552759274 }
```

**Pause** On all queues

Client -> Server

```
{ "class": "ipbxcommand", "command": "queuepause", "commandid": 859140432, "member": "agent:xivo/1" }
```

**Un pause agent** On all queues

Client -> Server

```
{ "class": "ipbxcommand", "command": "queueunpause", "commandid": 822604987, "member": "agent:xivo/1" }
```

**Add an agent in a queue** Client -> Server

```
{ "class": "ipbxcommand", "command": "queueadd", "commandid": 542766213, "member": "agent:xivo/3", "listid": 1 }
```

**Remove an agent from a queue** Client -> Server

```
{ "class": "ipbxcommand", "command": "queueremove", "commandid": 742480296, "member": "agent:xivo/1", "listid": 1 }
```

**Listen to an agent** Client -> Server

```
{ "class": "ipbxcommand", "command": "listen", "commandid": 1423579492, "destination": "xivo/1", "listid": 1 }
```

**Configuration** The following messages are used to retrieve XiVO configuration.

**Common fields**

- class : getlist
- function : listid
- commandid
- tipbxid
- listname : Name of the list to be retrieved : users, phones, agents, queues, voicemails, queuemembers

```
{
  "class": "getlist",
  "commandid": 489035169,
  "function": "listid",
  "tipbxid": "xivo",
  "listname": "....."
}
```

**Users configuration** Return a list of configured user id's

Client -> Server

```
{"class": "getlist", "commandid": 489035169, "function": "listid", "listname": "users", "tipbxid":
```

Server -> Client

```
{
  "class": "getlist",
  "function": "listid", "listname": "users",
  "list": ["11", "12", "14", "17", "1", "3", "2", "4", "9"],
  "tipbxid": "xivo", "timenow": 1362735061.17
}
```

**User configuration** Return a user configuration

- tid is the userid returned by *Users configuration* message

Client -> Server

```
{
  "class": "getlist",
  "function": "updateconfig",
  "listname": "users",
  "tid": "17",
  "tpbxid": "xivo", "commandid": 5}
```

Server -> Client

```
{
  "class": "getlist",
  "function": "updateconfig",
  "listname": "users",
  "tid": "17",
  "tipbxid": "xivo",
  "timenow": 1362741166.4,
  "config": {
    "enablednd": 0, "destrna": "", "enablerna": 0, "enableunc": 0, "destunc": "", "destbusy":
    "firstname": "Alice", "lastname": "Bouzat", "fullname": "Alice Bouzat",
    "voicemailid": null, "incallfilter": 0, "enablevoicemail": 0, "profileclient": null,
  }
}
```

**Phones configuration** Client -> Server

```
{"class": "getlist", "commandid": 495252308, "function": "listid", "listname": "phones", "tipbxid":
```

Server > Client

```
{"class": "getlist", "function": "listid", "list": ["1", "3", "2", "5", "14", "7", "6", "9", "8"],
  "listname": "phones", "timenow": 1364994093.38, "tipbxid": "xivo"}
```

Individual phone configuration request:

```
{"class": "getlist", "commandid": 704096693, "function": "updateconfig", "listname": "phones", "t
```

Server > Client

```
{"class": "getlist",
  "config": {"allowtransfer": null, "context": "default", "identity": "SIP/ihvbur", "iduserfeatu
    "initialized": null, "number": "1000", "protocol": "sip"},
  "function": "updateconfig", "listname": "phones", "tid": "3", "timenow": 1364994093.43, "tipbx
```

**Agents configuration** Client -> Server

```
{ "class": "getlist", "commandid": 1431355191, "function": "listid", "listname": "agents", "tipbxid": "xivo", "timenow": 1382704649.64, "class": "getlist" }
```

#### Queues configuration Client -> Server

```
{ "class": "getlist", "commandid": 719950939, "function": "listid", "listname": "queues", "tipbxid": "xivo", "timenow": 1382704649.64, "class": "getlist" }
```

Server -> Client

```
{ "function": "listid", "listname": "queues", "tipbxid": "xivo",  
  "list": [ "1", "10", "3", "2", "5", "4", "7", "6", "9", "8" ], "timenow": 1382704649.64, "class": "getlist" }
```

#### Queue configuration tid is the id returned in the list field of the getlist response message

Client -> Server

```
{ "commandid": 7, "class": "getlist", "tid": "3", "tipbxid": "xivo", "function": "updateconfig", "listname": "queues", "timenow": 1382704649.69, "class": "getlist" }
```

Server -> Client

```
{  
  "function": "updateconfig", "listname": "queues", "tipbxid": "xivo", "timenow": 1382704649.69, "class": "getlist",  
  "config": {  
    "displayname": "red", "name": "red", "context": "default", "number": "3002"},  
  "class": "getlist" }
```

#### Voicemails configuration Client -> Server

```
{ "class": "getlist", "commandid": 1034160761, "function": "listid", "listname": "voicemails", "tipbxid": "xivo", "timenow": 1382704649.69, "class": "getlist" }
```

#### Queue members configuration Client -> Server

```
{ "class": "getlist", "commandid": 964899043, "function": "listid", "listname": "queuemembers", "tipbxid": "xivo", "timenow": 1382717016.23, "class": "getlist" }
```

Server -> Client

```
{ "function": "listid", "listname": "queuemembers", "tipbxid": "xivo",  
  "list": [ "Agent/2501,blue", "Agent/2500,yellow", "Agent/2002,yellow", "Agent/2003,switchboard",  
    "Agent/2003,blue", "Agent/108,blue", "Agent/2002,blue" ],  
  "timenow": 1382717016.23,  
  "class": "getlist" }
```

## Fax

#### Send fax Client -> Server

```
{ "class": "faxsend", "hide": "0", "filename": "contract.pdf", "destination": "41400" }
```

#### Fax status Server -> Client

- pages: number of pages sent (NULL if FAILED)
- status
  - FAILED: Failed to send fax.
  - PRESENDFAX: Fax number exist and converting pdf->tiff has been done.
  - SUCCESS: Fax sent with success.

```
{ "class": "fax_progress", "status": "SUCCESS", "pages": 2 }
```

## **IPBX Commands**

### **Dial**

- destination can be any number
- destination can be a pseudo URL of the form “type:ibpx/id”

Client -> Server

```
{
  "class": "ipbxcommand",
  "command": "dial",
  "commandid": <commandid>,
  "destination": "exten:xivo/<extension>"
}
```

For example :

```
{
  "class": "ipbxcommand",
  "command": "dial",
  "commandid": 1683305913,
  "destination": "exten:xivo/1202"
}
```

The server will answer with either an error or a success:

```
{
  "class": "ipbxcommand",
  "error_string": "unreachable_extension:1202",
}

{
  "class": "dial_success",
  "exten": "1202"
}
```

**Originate** Same message than the *dial* message with a source field. The source field is user:xivo/<userid>, userid is replaced by a user identifier returned by the message getting *Users configuration* list

Example:

```
{
  "class": "ipbxcommand",
  "command": "originate",
  "commandid": 1683305913,
  "source": "user:xivo/34",
  "destination": "exten:xivo/1202"
}
```

**Hangup** Client -> Server

```
{
  "class": "ipbxcommand",
  "command": "hangup",
  "channelids": "chan:xivo/<channel_id>",
  "commandid": <command_id>
}
```

For example:

```
{
  "class": "ipbxcommand",
  "command": "hangup",
  "channelids": "chan:xivo/SIP/im2p7kzr-00000003",
  "commandid": 177773016
}
```

Server -> Client

```
{
  "class": "ipbxcommand",
  "command": "hangup",
  "ipbxreply": 1,
  "replyid": 177773016,
  "timenow": 1395756534.64
}
```

**Login** Once the network is connected at the socket level, the login process requires three steps. If one of these steps is omitted, the connection is reset by the cti server.

- login\_id, the username is sent as a login to the cti server, cti server answers by giving a sessionid
- login\_pass, the password combined with the sessionid is sent to the cti server, cti server answers by giving a capaid
- login\_capas, the capaid is returned to the server with the phone state, cti server answers with a list of info relevant to the user

```
{
  "commandid": <commandid>,
  "class": "login_id",
}
```

- class: defined what class of command use.
- commandid : a unique integer number.

**Login ID** Client -> Server

```
{
  "class": "login_id",
  "commandid": 1092130023,
  "company": "default",
  "ident": "X11-LE-24079",
  "lastlogout-datetime": "2013-02-19T11:13:36",
  "lastlogout-stopper": "disconnect",
  "userlogin": <userlogin>,
  "version": "9999",
  "xivoversion": "1.2"
}
```

Server -> Client

```
{
  "class": "login_id",
  "sessionid": "21UaGDfst7",
  "timenow": 1361268824.64,
  "xivoversion": "1.2"
}
```

---

**Note:** sessionid is used to calculate the hashed password in next step

---

**Login password** Client -> Server

```
{
  "hashedpassword": "e5229ef45824333e0f8bbeed20dccfa2ddcb1c80",
  "class": "login_pass",
  "commandid": <commandid>
}
```

---

**Note:** hashed\_password = sha1(self.sessionid + ':' + password).hexdigest()

---

Server -> Client

```
{
  "capalist": [
    2
  ],
  "class": "login_pass",
  "replyid": 1646064863,
  "timenow": 1361268824.68
}
```

If no CTI profile is defined on XiVO for this user, the following message will be sent:

```
{
  "error_string": "capaid_undefined",
  "class": "login_pass",
  "replyid": 1646064863,
  "timenow": 1361268824.68
}
```

---

**Note:** the first element of the capalist is used in the next step login\_capas

---

**Login capas** Client -> Server

```
{
  "loginkind": "user",
  "capaid": 3,
  "lastconnwins": False,
  "commandid": <commandid>,
  "state": "available",
  "class": "login_capas"
}
```

loginkind can be 'user' or 'agent', if 'agent', the property 'agentphonenumber' can be added.

Server -> Client

First message, describes all the capabilities of the client, configured at the server level

- presence : actual presence of the user
- userid : the user id, can be used as a reference
- capas
  - **userstatus** [a list of available statuses]

```
"tid": "3",
"config": {"enablednd": false},
"class": "getlist"
}
```

Third message describes the current user status

```
{
  "function": "updatestatus",
  "listname": "users",
  "status": {"availstate": "available"},
  "tipbxid": "xivo",
  "tid": "3",
  "class": "getlist",
  "timenow": 1361440830.99
}
```

## Others

**call\_form\_result** This message is received when a *call form* is submitted from a client to the XiVO.

Client -> Server

```
{
  "class": "call_form_result",
  "commandid": <commandid>,
  "infos": {"buttonname": "saveandclose",
    "variables": {"XIVOFORM_varname1": "value1",
      "XIVOFORM_varname2": "value2"}}
}
```

## History

- size : Size of the list to be sent by the server

Client -> Server

```
{
  "class": "history",
  "commandid": <commandid>
  "size": "8",
  "xuserid": "<xivoid>/<userfeaturesid>",
}
```

Server > Client

Send back a table of calls :

- duration in seconds
- extension: caller/destination extension
- fullname: caller ID name
- mode
  - 0 : sent calls
  - 1 : received calls
  - 2 : missed calls

```
{
  "class": "history",
  "history": [
    {
      "calldate": "2013-03-29T08:44:35.273998",
      "duration": 30.148765,
      "extension": "*844201",
      "fullname": "Alice Wonderland",
      "mode": 0
    },
    {
      "calldate": "2013-03-28T16:56:48.071213",
      "duration": 58.134744,
      "extension": "41400",
      "fullname": "41400"
    }
  ],
  "replyid": 529422441,
  "timenow": 1364571477.33
}
```

### Chitchat

```
{
  "class": "chitchat",
  "text": "message envoye",
  "to": "<xivoid>/<userfeaturesid>",
  "commandid": <commandid>
}
```

featuresget

featuresput

**Directory** Request directory information, names matching pattern ignore case.

Client -> Server

```
{
  "class": "directory",
  "commandid": 1079140548,
  "pattern": "pau"
}
```

Server > Client

```
{
  "class": "directory",
  "headers": ["Nom", "Num\u00e9ro", "Mobile", "Autre num\u00e9ro", "E-mail", "Fonction", "Site",
  "replyid": 1079140548,
  "resultlist": ["Claire Mapaurtal;;+33644558899;31256;cmapaurtal@societe.com;;;",
    "Paul Salvadier;+33445236988;+33678521430;31406;psalvadier@societe.com;;;"],
  "status": "ok",
  "timenow": 1378798928.26
}
```

parking

keepalive

availstate

filetransfer

getipbxlist

```
{
  "class": "getipbxlist",
  "commandid": <commandid>
}
```

#### ipbxcommand

```
{
  "class": "ipbxcommand",
  "command": "originate",
  "commandid": <commandid>,
  "destination": "user:special:myvoicemail",
  "source": "user:special:me"
}
```

## People

### People headers Client -> Server

```
{
  "class": "people_headers",
  "commandid": <commandid>
}
```

### Server -> Client

```
{
  "class": "people_headers_result",
  "commandid": <commandid>,
  "column_headers": ["Status", "Name", "Number"],
  "column_types": [null, null, "number"],
}
```

### People Search Client -> Server

```
{
  "class": "people_search",
  "pattern": <pattern>,
  "commandid": <commandid>
}
```

### Server -> Client

```
{
  "class": "people_search_result",
  "commandid": <commandid>
  "term": "Bob",
  "column_headers": ["Firstname", "Lastname", "Phone number", "Mobile", "Fax", "Email", "Agent"],
  "column_types": [null, "name", "number_office", "number_mobile", "fax", "email", "relation_agent"],
  "results": [
    {
      "column_values": ["Bob", "Marley", "5555555", "5556666", "5553333", "mail@example.com", null],
      "relations": {
        "agent_id": null,
        "user_id": null,
        "endpoint_id": null,
        "source_entry_id": null
      },
      "source": "my_ldap_directory"
    }, {
      "column_values": ["Charlie", "Boblin", "5555556", "5554444", "5552222", "mail2@example.com", null]
    }
  ]
}
```

```

    "relations": {
      "agent_id": 12,
      "user_id": 34,
      "endpoint_id": 56,
      "source_entry_id": "34"
    },
    "source": "internal"
  }
]
}

```

#### Favorites list Client -> Server

```

{
  "class": "people_favorites",
  "commandid": <commandid>
}

```

#### Server -> Client

```

{
  "class": "people_favorites_result",
  "commandid": <commandid>
  "column_headers": ["Firstname", "Lastname", "Phone number", "Mobile", "Fax", "Email", "Agent", "Relation"],
  "column_types": [null, "name", "number_office", "number_mobile", "fax", "email", "relation_agent"],
  "results": [
    {
      "column_values": ["Bob", "Marley", "5555555", "5556666", "5553333", "mail@example.com", null],
      "relations": {
        "agent_id": null,
        "user_id": null,
        "endpoint_id": null,
        "source_entry_id": 55
      },
      "source": "my_ldap_directory"
    }, {
      "column_values": ["Charlie", "Boblin", "5555556", "5554444", "5552222", "mail2@example.com", null],
      "relations": {
        "agent_id": 12,
        "user_id": 34,
        "endpoint_id": 56,
        "source_entry_id": "34"
      },
      "source": "internal"
    }
  ]
}

```

#### Set favorite Client -> Server

```

{
  "class": "people_set_favorite",
  "source": "my_ldap_directory"
  "source_entry_id": "55"
  "favorite": true
  "commandid": <commandid>
}

```

#### Server -> Client

```
{
  "class": "people_favorite_update",
  "source": "my_ldap_directory"
  "source_entry_id": "55"
  "favorite": true
  "commandid": <commandid>
}
```

## Service

- class : featuresput

## Call Filtering

- function : incallfilter
- value : true, false activate deactivate filtering

Client -> Server

```
{"class": "featuresput", "commandid": 1326845972, "function": "incallfilter", "value": true}
```

Server > Client

```
{
  "class": "getlist",
  "config": {"incallfilter": true},
  "function": "updateconfig",
  "listname": "users",
  "tid": "2",
  "timenow": 1361456398.52, "tipbxid": "xivo" }
}
```

## DND

- function : enablednd
- value : true, false activate deactivate DND

Client -> Server

```
{"class": "featuresput", "commandid": 1088978942, "function": "enablednd", "value": true}
```

Server > Client

```
{
  "class": "getlist",
  "config": {"enablednd": true},
  "function": "updateconfig",
  "listname": "users",
  "tid": "2",
  "timenow": 1361456614.55, "tipbxid": "xivo"}
}
```

## Recording

- function : enablerecording
- value : true, false

Activate / deactivate recording for a user, extension call recording has to be activated : *Services->IPBX->IPBX services->Extension*

Client -> Server

```
{ "class": "featuresput", "commandid": 1088978942, "function": "enablerecording", "value": true, "tid": "7", "timenow": 1361456614.55, "tipbxid": "xivo" }
```

Server > Client

```
{
  "class": "getlist",
  "config": { "enablerecording": true },
  "function": "updateconfig",
  "listname": "users",
  "tid": "7",
  "timenow": 1361456614.55, "tipbxid": "xivo" }
```

**Unconditional Forward** Forward the call at any time, call does not reach the user

- function : fwd

Client -> Server

```
{
  "class": "featuresput", "commandid": 2082138822, "function": "fwd",
  "value": { "destunc": "1002", "enableunc": true }
}
```

Server > Client

```
{
  "class": "getlist",
  "config": { "destunc": "1002", "enableunc": true },
  "function": "updateconfig",
  "listname": "users",
  "tid": "2",
  "timenow": 1361456777.98, "tipbxid": "xivo" }
```

**Forward On No Answer** Forward the call to another destination if the user does not answer

- function : fwd

Client -> Server

```
{
  "class": "featuresput", "commandid": 1705419982, "function": "fwd",
  "value": { "destrna": "1003", "enablerna": true }
}
```

Server > Client

```
{
  "class": "getlist",
  "config": { "destrna": "1003", "enablerna": true },
  "function": "updateconfig",
  "listname": "users",
  "tid": "2",
  "timenow": 1361456966.89, "tipbxid": "xivo" }
```

**Forward On Busy** Forward the call to another destination when the user is busy

- function : fwd

Client -> Server

```
{
  "class": "featuresput", "commandid": 568274890, "function": "fwd",
```

```
"value": {"destbusy": "1009", "enablebusy": true}
}
```

Server > Client

```
{
  "class": "getlist",
  "config": {"destbusy": "1009", "enablebusy": true},
  "function": "updateconfig",
  "listname": "users",
  "tid": "2",
  "timenow": 1361457163.77, "tipbxid": "xivo"
}
```

## Statistics

**Subscribe to queues stats** This message can be sent from the client to enable statistics update on queues

Client -> Server

```
{"commandid":36,"class":"subscribetoqueuesstats"}
``Server > Client``
```

**Get queues stats** When statistic update is enable by sending message *Subscribe to queues stats*.

The first element of the message is the queue id

```
{"stats": {"10": {"Xivo-LoggedAgents": 0}},
  "class": "getqueuesstats", "timenow": 1384509582.88}
{"stats": {"1": {"Xivo-WaitingCalls": 0}},
  "class": "getqueuesstats", "timenow": 1384509582.89}
{"stats": {"1": {"Xivo-TalkingAgents": "0", "Xivo-AvailableAgents": "1", "Xivo-EWT": "6"}},
  "class": "getqueuesstats", "timenow": 1384512350.25}
```

**Status** These messages can also be received without any request as unsolicited messages.

**User status** User status is to manage user presence

- Request user status update

Client -> Server

```
{"class": "getlist", "commandid": 107712156,
  "function": "updatestatus",
  "listname": "users",
  "tid": "14", "tipbxid": "xivo"}
```

Server > Client

```
{"class": "getlist",
  "function": "updatestatus",
  "listname": "users",
  "status": {"availstate": "outtolunch", "connection": "yes"},
  "tid": "1", "timenow": 1364994093.48, "tipbxid": "xivo"}
```

- Change User status

Client -> Server

```
{
  "availstate": "away",
  "class": "availstate",
  "commandid": 1946092392,
  "ipbxid": "xivo",
  "userid": "1"}
```

Server > Client

```
{
  "class": "getlist",
  "function": "updatestatus",
  "listname": "users",
  "status": {
    "availstate": "away"
  },
  "tid": "1",
  "timenow": 1370523352.6,
  "tipbxid": "xivo"}
```

### Phone status

- tid is the line id, found in linelist from message *User configuration*

Client -> Server

```
{
  "class": "getlist",
  "commandid": 107712156,
  "function": "updatestatus",
  "listname": "phones",
  "tid": "8",
  "tipbxid": "xivo"}
```

Server > Client

```
{
  "class": "getlist",
  "function": "updatestatus",
  "listname": "phones",
  "status": {
    "channels": [],
    "groups": [],
    "hintstatus": "0",
    "queues": []
  },
  "tid": "1",
  "timenow": 1364994093.48,
  "tipbxid": "xivo"}
```

### Queue status Client -> Server

```
{
  "commandid": 17,
  "class": "getlist",
  "tid": "8",
  "tipbxid": "xivo",
  "function": "updatestatus",
  "listname": "queues"}
```

Server > Client

```
{
  "function": "updatestatus",
  "listname": "queues",
  "tipbxid": "xivo",
  "timenow": 1382710430.54,
  "status": {
    "agentmembers": ["1", "5"],
    "phonemembers": ["8"]
  },
  "tid": "8",
  "class": "getlist"}
```

### Agent status

- tid is the agent id.

Client -> Server

```
{
  "class": "getlist",
  "commandid": <random_integer>,
  "function": "updatestatus",
  "listname": "agents",
  "tid": "635",
  "tipbxid": "xivo"}
```

Server > Client

```
{
  "class": "getlist",
  "listname": "agents",
  "function": "updatestatus",
  "tipbxid": "xivo",
  "tid": 635,
  "status": {
    "availability": "logged_out",
```

```

    "availability_since": 1370868774.74,
    "channel": null,
    "groups": [],
    "on_call_acd": false,
    "on_call_nonacd": false,
    "on_wrapup": false,
    "phonenumber": null,
    "queues": [
        "113"
    ]
}

```

- availability can take the values:
  - logged\_out
  - available
  - unavailable
  - on\_call\_nonacd\_incoming\_internal
  - on\_call\_nonacd\_incoming\_external
  - on\_call\_nonacd\_outgoing\_internal
  - on\_call\_nonacd\_outgoing\_external
- availability\_since is the timestamp of the last availability change
- queues is the list of queue ids from which the agent receives calls

## Switchboard

**Answer** This allows the switchboard operator to answer an incoming call or unhold a call on-hold.

```

{"class": "answer", "uniqueid": "12345667.89"}

```

**Unsolicited Messages** These messages are received whenever one of the following corresponding event occurs: sheet message on incoming calls, or updatestatus when a phone status changes.

**Sheet** This message is received to display customer information if configured at the server side

```

{
    "timenow": 1361444639.61,
    "class": "sheet",
    "compressed": true,
    "serial": "xml",
    "payload": "AAADnnicndPBToNAEAbgVln3XgFN1AP.....",
    "channel": "SIP/e6fhff-00000007"
}

```

How to decode payload :

```

>>> b64content = base64.b64decode(<payload content>)
>>> # 4 first cars are the encoded lenght of the xml string (in Big Endian format)
>>> xmlen = struct.unpack('>I',b64content[0:4])
>>> # the rest is a compressed xml string
>>> xmlcontent = zlib.decompress(toto[4:])
>>> print xmlcontent

<?xml version="1.0" encoding="utf-8"?>
<profile>

```

```

<user>
  <internal name="ipbxid"><![CDATA[xivo]]></internal>
  <internal name="where"><![CDATA[dial]]></internal>
  <internal name="channel"><![CDATA[SIP/barometrix_jyldev-00000009]]></internal>
  <internal name="focus"><![CDATA[no]]></internal>

### Phone status update Received when a phone status change

- class : getlist
- function : updatestatus
- listname : phones

```

{
  "class": "getlist",
  "function": "updatestatus",
  "listname": "phones",
  "tipbxid": "xivo",
  "timenow": 1361447017.29,
  .....
}

```

tid is the the object identification

Example of phone messages received when a phone is ringing :

```

{ ... "status": {"channels": ["SIP/x2gjwtw-0000000b"]}, "tid": "3", }
{.... "status": {"channels": ["SIP/x2gjwtw-0000000b"], "queues": [], "hintstatus": "0", "groups":
{.... "status": {"hintstatus": "8"}, "tid": "3"}

```

### channel status update

- class : getlist
- function : updatestatus
- listname : channels
- status
  - direction : (in,out ...)
  - state : (Down, Ring, Unknown ...)
  - commstatus : (ready, calling, ringing ...)

```

{
  "class": "getlist",
  "function": "updatestatus",
  "listname": "channels",
  "tipbxid": "xivo",
  "timenow": 1361447017.29,

```

```

    .....
}

```

Example of phone messages received when a phone is ringing :

```

{"status": {"timestamp": 1361447017.22, "holded": false, "commstatus": "ready", "parked": false,
{"status": {"timestamp": 1361447017.29, "holded": false, "commstatus": "ready", "parked": false,
{"status": {"talkingto_kind": "channel", "direction": "out", "timestamp": 1361447017.29, "holded":
{"status": {"direction": "in", "timestamp": 1361447017.29, "holded": false, "talkingto_id": "SIP/1

```

## Update notification

**Register agent status update** The *register\_agent\_status\_update* command is used to register to the status updates of a list of agent. Once registered to a agent's status, the client will receive all *Agent status update* events for the registered agents.

This command should be sent when an agent is displayed in the people xlet to be able to update the agent status icon.

The *Unregister agent status update* command should be used to stop receiving updates.

Client -> Server

```

{
  "class": "register_agent_status_update",
  "agent_ids": [ ["<xivo-uuid>", "<agent-id1>"],
                 ["<xivo-uuid>", "<agent-id2>"],
                 ...,
                 ["<xivo-uuid>", "<agent-idn>"] ],
  "commandid": <commandid>
}

```

**Unregister agent status update** The *unregister\_agent\_status\_update* command is used to unregister from the status updates of a list of agent.

Once unregistered, the client will stop receiving the *Agent status update* events for the specified agents.

Client -> Server

```

{
  "class": "unregister_agent_status_update",
  "agent_ids": [ ["<xivo-uuid>", "<agent-id1>"],
                 ["<xivo-uuid>", "<agent-id2>"],
                 ...,
                 ["<xivo-uuid>", "<agent-idn>"] ],
  "commandid": <commandid>
}

```

**Agent status update** The *agent\_status\_update* event is received when the presence of an agent changes.

To receive this event, the user must first register to the event for a specified agent using the *Register agent status update* command.

To stop receiving this event, the user must send the *Unregister agent status update* command.

- data, a dictionary containing 3 fields:
  - agent\_id, is an integer containing the ID of the user affected by this status change
  - xivo\_uuid: a string containing the UUID of the XiVO that sent the status update
  - status: a string containing the new status, “logged\_in” or “logged\_out”

Server -> Client

```
{
  "class": "agent_status_update",
  "data": {
    "agent_id": 42,
    "xivo_uuid": "<the-xivo-uuid>",
    "status": "<status-name>"
  }
}
```

The *agent\_status\_update* event contains the same data as the *agent\_status\_update*. The latter should be preferred to the former for uses that do not require a persistent connection to xivo-ctid.

**Register endpoint status update** The *register\_endpoint\_status\_update* command is used to register to the status updates of a list of lines. Once registered to a endpoint's status, the client will receive all *Endpoint status update* events for the registered agents.

This command should be sent when a endpoint is displayed in the people xlet to be able to update the agent status icon.

The *Unregister endpoint status update* command should be used to stop receiving updates.

Client -> Server

```
{
  "class": "register_endpoint_status_update",
  "endpoint_ids": [ "<xivo-uuid>", "<endpoint-id1>",
                  "<xivo-uuid>", "<endpoint-id2>",
                  ...,
                  "<xivo-uuid>", "<endpoint-idn>" ],
  "commandid": <commandid>
}
```

**Unregister endpoint status update** The *unregister\_endpoint\_status\_update* command is used to unregister from the status updates of a list of agent.

Once unregistered, the client will stop receiving the *Endpoint status update* events for the specified agents.

Client -> Server

```
{
  "class": "unregister_endpoint_status_update",
  "endpoint_ids": [ "<xivo-uuid>", "<endpoint-id1>",
                  "<xivo-uuid>", "<endpoint-id2>",
                  ...,
                  "<xivo-uuid>", "<endpoint-idn>" ],
  "commandid": <commandid>
}
```

**Endpoint status update** The *endpoint\_status\_update* event is received when the status of a line changes.

To receive this event, the user must first register to the event for a specified endpoint using the *Register endpoint status update* command.

To stop receiving this event, the user must send the *Unregister endpoint status update* command.

- data, a dictionary containing 3 fields:
  - endpoint\_id, is an integer containing the ID of the line affected by this status change
  - xivo\_uuid: a string containing the UUID of the XiVO that sent the status update
  - status: an integer matching an entry in the cti hint configuration

Server -> Client

```
{
  "class": "endpoint_status_update",
  "data": {
    "endpoint_id": 42,
    "xivo_uuid": "<the-xivo-uuid>",
    "status": <hint-status>
  }
}
```

The *endpoint\_status\_update* event contains the same data as the *endpoint\_status\_update*. The latter should be preferred to the former for uses that do not require a persistent connection to xivo-ctid.

**Register user status update** The *register\_user\_status\_update* command is used to register to the status updates of a list of user. Once registered to a user's status, the client will receive all *User status update* events for the registered users.

This command should be sent when a user is displayed in the people xlet to be able to update the presence status icon.

The *Unregister user status update* command should be used to stop receiving updates.

Client -> Server

```
{
  "class": "register_user_status_update",
  "user_ids": [
    ["<xivo-uuid>", "<user-id1>"],
    ["<xivo-uuid>", "<user-id2>"],
    ...,
    ["<xivo-uuid>", "<user-idn>"]
  ],
  "commandid": <commandid>
}
```

**Unregister user status update** The *unregister\_user\_status\_update* command is used to unregister from the status updates of a list of user.

Once unregistered, the client will stop receiving the *User status update* events for the specified users.

Client -> Server

```
{
  "class": "unregister_user_status_update",
  "user_ids": [
    ["<xivo-uuid>", "<agent-id1>"],
    ["<xivo-uuid>", "<agent-id2>"],
    ...,
    ["<xivo-uuid>", "<agent-idn>"]
  ],
  "commandid": <commandid>
}
```

**User status update** The *user\_status\_update* event is received when the presence of a user changes.

To receive this event, the user must first register to the event for a specified user using the *Register user status update* command.

To stop receiving this event, the user must send the *Unregister user status update* command.

- data, a dictionary containing 3 fields:
  - user\_id, is an integer containing the ID of the user affected by this status change
  - xivo\_uuid: a string containing the UUID of the XiVO that sent the status update
  - status: a string containing the new status of the user based on the cti profile configuration

---

**Note:** When multiple XiVO share user statuses, the cti profile configuration for presences and phone statuses should match on all XiVO to be displayed properly

---

Server -> Client

```
{
  "class": "user_status_update",
  "data": {
    "user_id": 42,
    "xivo_uuid": "<the-xivo-uuid>",
    "status": "<status-name>"
  }
}
```

The *user\_status\_update* event contains the same data as the *user\_status\_update*. The latter should be preferred to the former for uses that do not require a persistent connection to xivo-ctid.

### CTI server implementation

In the git repository `git://github.com/xivo-pbx/xivo-ctid.git`

- *cti\_config* handles the configuration coming from the WEBI
- *interfaces/interface\_ami*, together with *asterisk\_ami\_definitions*, *amiinterpret* and *xivo\_ami* handle the AMI connections (asterisk)
- *interfaces/interface\_info* handles the CLI-like connections
- *interfaces/interface\_webi* handles the requests and signals coming from the WEBI
- *interfaces/interface\_cti* handles the clients' connections, with the help of *client\_connection*, and it often involves *cti\_command* too
- *innerdata* is meant to be the place where all statuses are computed and stored

The main loop uses *select()* syscall to dispatch the tasks according to miscellaneous incoming requests.

Requirements for *innerdata*:

- the properties fetched from the WEBI configuration shall be stored in the relevant *xod\_config* structure
- the properties fetched from elsewhere shall be stored in the relevant *xod\_status* structure
- at least two kinds of objects are not “predefined” (as are the phones or the queues, for instance)
  - the channels (in the asterisk SIP/345-0x12345678 meaning)
  - the group and queue members shall be handled in a special way each

The purpose of the ‘relations’ field, in the various structures is to keep track of relations and cross-relations between different objects (a phone logged in as an agent, itself in a queue, itself called by some channels belonging to phones ...).

### CTI server Message flow

Messages sent from the CTI clients to the server are received by the CTIServer class. The CTIServer then calls `interface_cti.CTI` class `manage_connection` method. The `interface_cti` uses his `_cti_command_handler` member to parse and run the command. The CTICommandHandler get a list of classes that handle this message from the CTICommandFactory. Then the `interface_cti.CTI` calls `run_commands` on the handler, which returns a list of all commands replies.

To implement a new message in the protocol you have to create a new class that inherits the CTICommand class. Your new class should have a static member `caller_required_fields` which is a list of required fields for this

class. Your class should also have a `conditions` static member which is a list of tuples of conditions to detect that an incoming message matches this class. The `__init__` of your class is responsible for the initialization of it's fields and should call `super(<ClassName>, self).__init__(msg)`. Your class should register itself to the `CTICommandFactory`.

```
from xivo_cti.cti.cti_command import CTICommand
from xivo_cti.cti.cti_command_factory import CTICommandFactory

class InviteConfroom(CTICommand):
    required_fields = ['class', 'invitee']
    conditions = [('class', 'invite_confroom')]
    def __init__(self):
        super(InviteConfroom, self).__init__(msg)
        self._invitee = msg['invitee']

CTICommandFactory.register_class(InviteConfroom)
```

Each CTI commands has a callback list that you can register to from anywhere. Each callback function will be called when this message is received with the command as parameter.

Refer to `MeetmeList.__init__` for a callback registration example and to `MeetmeList.invite` for the implementation of a callback.

```
from xivo_cti.cti.commands.invite_confroom import InviteConfroom

class MySuperClass(object):
    def __init__(self):
        InviteConfroom.register_callback(self.invite_confroom_handler)

    def invite_confroom_handler(self, invite_confroom_command):
        # Do your stuff here.
        if ok:
            return invite_confroom_command.get_message('Everything is fine')
        else:
            return invite_confroom_command.get_warning('I don't know you, go away', True)
```

---

**Note:** The client's connection is injected in the command instance before calling callbacks functions. The client's connection is an `interface_cti.CTI` instance.

---

## ppcticonf

*ppcticonf* is a small utility used to pretty print the CTI server configuration.

The utility is installed by default with XiVO. It comes with the `xivo-utils` package.

In fact, *ppcticonf* can be used to pretty print any URL or file that contains a JSON document.

### How-to

The simplest invocation is:

```
$ ppcticonf
{
  "agentstatus": [],
  "bench": 0.077938079833984,
  "certfile": "/var/lib/xivo/certificates/test2.crt",
  "channelstatus": [],
  "contexts": {
    "*": {
      "didextens": {
```

```

        "xivodir"
    ]
}
},
"default": {
    "directories": [
        "xivodir",
        "internal"
    ],
    "display": "Display"
}
},
.....
}

```

You can also pass a URL as an argument:

```

$ ppcticonf http://127.0.0.1/service/ipbx/json.php/private/pbx_settings/users
[
    {
        "agentid": null,
        "bsfilter": "no",
        "callerid": "\"User 2\"",
        "callrecord": false,
        "commented": false,
        "description": "",
        "destbusy": "",
        "destrna": "",
        "destunc": "",
        "enableautomon": false,
        "enablebusy": false,
        "enableclient": true,
        "enablednd": false,
        "enablehint": true,
        "enablerna": false,
        "enableunc": false,
        "enablevoicemail": false,
        "enablexfer": false,
        "entityid": 1,
        "firstname": "User",
        "fullname": "User 2",
        "id": 2,
        "identity": "User 2",
        "incallfilter": false,
        .....
    }
]

```

Alternatively, you can pass a file path as an argument:

```

$ curl -s https://localhost/service/ipbx/json.php/private/ctiserver/configuration > cticonf
$ ppcticonf cticonf
{
    "agentstatus": [],
    "bench": 0.078904151916504003,
    "certfile": "/var/lib/xivo/certificates/test2.crt",
    "channelstatus": [],
    "contexts": {
        "*": {
            "didextens": {
                "*": [
                    "xivodir"
                ]
            }
        }
    }
}

```

```
    }
  },
  "default": {
    "directories": [
      "xivodir",
      "internal"
    ],
    "display": "Display"
  }
}
.....
}
```

### 1.12.11 XiVO Daemon Skeleton

#### Description

see [GitHub Project](#) for more infos

### 1.12.12 Database

#### Adding a Migration Script

Strating with XiVO 14.08, the database migration is handled by [alembic](#).

The XiVO migration scripts can be found in the [xivo-manage-db](#) repository.

On a XiVO, they are located in the `/usr/share/xivo-manage-db` directory.

To add a new migration script from your developer machine, go into the root directory of the `xivo-manage-db` repository. There should be an `alembic.ini` file in this directory. You can then use the following command to create a new migration script:

```
alembic revision -m "<description>"
```

This will create a file in the `alembic/versions` directory, which you'll have to edit.

When the migration scripts are executed, they use a connection to the database with the role/user `asterisk`. This means that new objects that are created in the migration scripts will be owned by the `asterisk` role and it is thus not necessary (nor recommended) to explicitly grant access to objects to the `asterisk` role (i.e. no "GRANT ALL" command after a "CREATE TABLE" command).

### 1.12.13 Diagrams

#### Agent states

Graphs representing states and transitions between agent states. Used in Agent status dashboard and agent list.

Download (DIA)

#### Architecture

### 1.12.14 Provisioning

This section describes the informations and tools for `xivo-provd`.

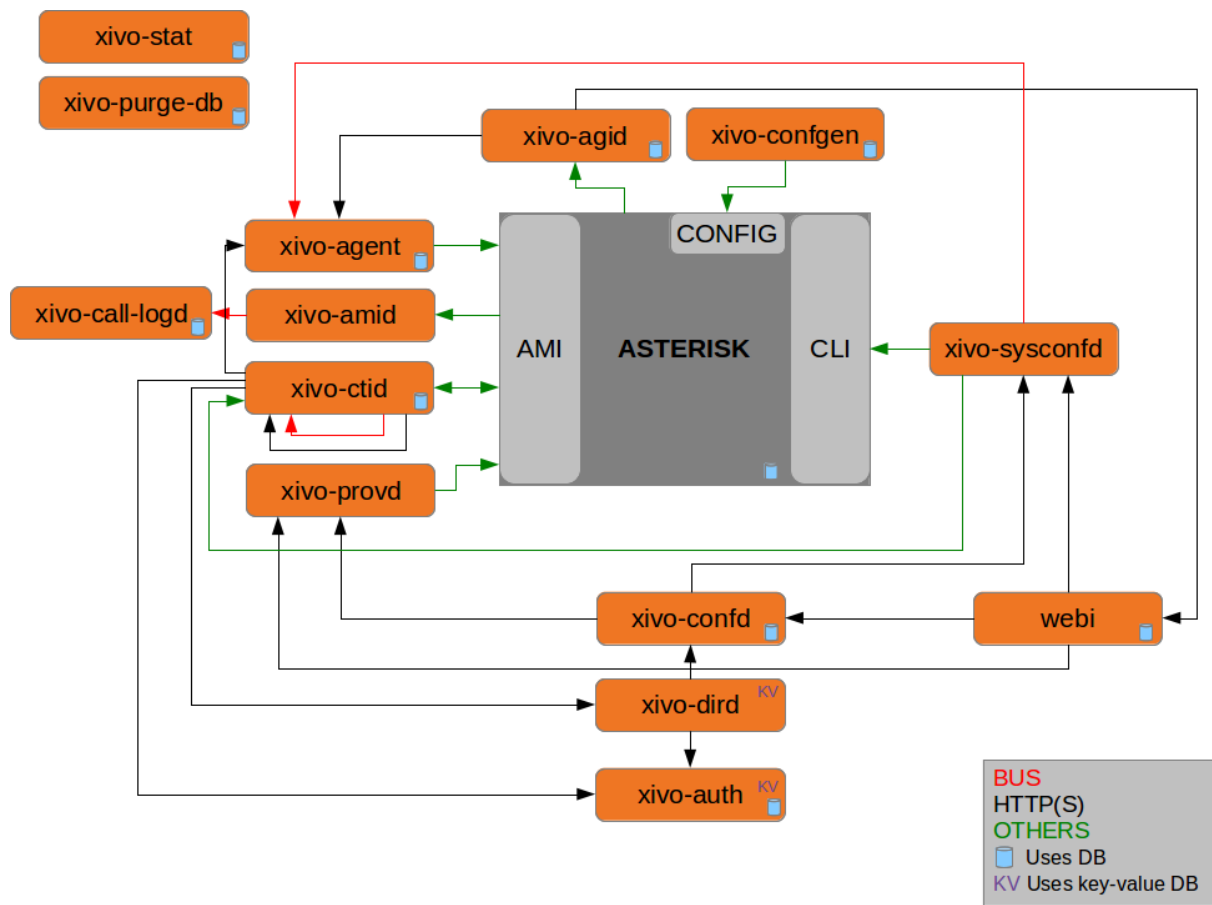

Fig. 1.97: Relationships between the components of XiVO. (source)

## Managing DHCP server configuration

This page considers the configuration files of the DHCP server in `/etc/dhcp/dhcpd_update/`.

### Who modifies the files

The files are updated with the command `dhcpd-update`, which is also run when updating the provisioning plugins. This commands fetches configurations files from the `provd.xivo.io` server.

### How to update the source files

#### Ensure your modifications are working

- On a XiVO, edit manually the file `/etc/dhcp/dhcpd_update/*.conf`
- `service isc-dhcp-server restart`
- If errors are shown in `/var/log/daemon.log`, check your modifications

#### Edit the files

- Edit the files in the Git repo `xivo-provd-plugins`, directory `dhcp/`
- Push your modifications
- Go in `dhcp/`
- Run `make upload` to push your modifications to `provd.xivo.io`. There is no testing version of these files. Once the files are uploaded, they are available for all XiVO installations.

## Managing Plugins

### Git Repository

Most plugin-related files are available in the [xivo-provd-plugins repository](#). Following examples are relative to the repository directory tree. Any modifications should be preceeded by a `git pull`.

### Updating a Plugin

We will be using the `xivo-cisco-spa` plugins family as an example on this page

There is one directory per family. Here is the directory structure for `xivo-cisco-spa`:

```
plugins/xivo-cisco-spa/
+-- model_name_xxx
+-- model_name_xxx
+-- common
+-- build.py
```

Every plugin has a folder called `common` which regroups common ressources for each model. Every model has its own folder with its version number.

After modifying a plugin, you must increment the version number. You can modify the file `plugin-info` to change the version number:

```
plugins/xivo-cisco-spa/
+-- model_name_xxx
    +-- plugin-info
```

---

**Important:** If ever you modify the folder `common`, you must increment the version number of all the models.

---

**Use Case: Update Firmwares for a given plugin** Let us suppose we want to update firmwares for xivo-snom from 8.7.3.25 to 8.7.3.25.5. Here are the steps to follow :

1. Copy folder `plugins/xivo-snom/8.7.3.25` to `plugins/xivo-snom/8.7.3.25.5`
2. Update `VERSION` number in `plugins/xivo-snom/8.7.3.25.5/entry.py`
3. Update `VERSION` number in `plugins/xivo-snom/8.7.3.25.5/plugin-info`
4. Download new firmwares (.bin files from [snom website](#))
5. Update `VERSION` number and URIs in `plugins/xivo-snom/8.7.3.25.5/pkg/pkg.db` (with uris of downloaded files from snom website)
6. Update sizes and sha1sums in `plugins/xivo-snom/8.7.3.25.5/pkg/pkg.db` (using helper script `xivo-tools/dev-tools/check_fw`)
7. Update `plugins/xivo-snom/build.py` (duplicate and update section `8.7.3.25 > 8.7.3.25.5`)

**Test your changes** You have three different methods to test your changes on your development machine.

**Always increase plugin version (easiest)** If the production version is 0.4, change the plugin version to 0.4.01, make your changes and upload to testing (see below).

Next modification will change the plugin version to 0.4.02, etc. When you are finished making changes, change the version to 0.5 and upload one last time.

**Edit directly on XiVO** Edit the files in `/var/lib/xivo-provd/plugins`.

To apply your changes, go in `xivo-provd-cli` and run:

```
plugins.reload('xivo-cisco-spa-7.5.4')
```

**Disable plugin caching** Edit `/etc/xivo/provd/provd.conf` and add the line:

```
cache_plugin: True
```

Empty `/var/cache/xivo-provd` and restart `provd`.

Make your changes in `provd-plugins`, update the plugin version to the new one and upload to testing (see below). Now, every time you uninstall/install the plugin, the new plugin will be fetched from testing, instead of being cached, even without changing the version.

**Uploading to testing** Before updating a plugin, it must be passed through the testing phase. Once it has been approved it can be uploaded to the production server

---

**Important:** Before uploading a plugin in the testing `provd` repository, make sure to git pull the `xivo-provd-plugins` git repository.

---

To upload the modified plugin in the testing repo on `provd.xivo.io`, you can execute the following command:

```
$ make upload
```

Afterwards, in the web-interface, you must modify the URL in section *Configuration* → *Provisioning* → *General* to:

```
`http://provd.xivo.io/plugins/1/testing/`
```

You can then update the list of plugins and check the version number for the plugin that you modified. Don't forget to install the plugin to test it.

**Mass-install all firmwares related to a given plugin** Using `xivo-provd-cli` on a xivo server, one can mass-install firmwares. Following example installs all firmwares for xivo-snom 8.7.3.25.5 plugin (note the auto-completion):

```
xivo-provd-cli> plugins.installed().keys()
[u'xivo-snom-8.7.3.15',
 u'xivo-cisco-sccp-legacy',
 u'xivo-snom-8.4.35',
 u'xivo-snom-8.7.3.25',
 u'xivo-aastra-switchboard',
 u'xivo-aastra-3.2.2-SP3',
 u'xivo-aastra-3.2.2.1136',
 u'xivo-cisco-sccp-9.0.3',
 u'null',
 u'xivo-snom-8.7.3.25.5']
xivo-provd-cli> p = plugins['xivo-snom-8.7.3.25.5']
xivo-provd-cli> p.install_all()
```

**Uploading to stable** Once checked, you must synchronize the plugin from *testing* to *stable*. If applicable, you should also update the archive repo.

To download the stable and archive plugins:

```
$ make download-stable
$ make download-archive
```

Go to the *plugins/\_build* directory and delete the plugins that are going to be updated. Note that if you are not updating a plugin but you are instead removing it “once and for all”, you should instead move it to the archive directory:

```
$ rm -fi stable/xivo-cisco-spa*
```

Copy the files from the directory *testing* to *stable*:

```
$ cp testing/xivo-cisco-spa* stable
```

Go back to the *plugins* directory and upload the files to the stable and archive repo:

```
$ make upload-stable
$ make upload-archive
```

The file are now up to date and you can test by putting back the *stable* url in the web-interface's configuration:

```
`http://provd.xivo.io/plugins/1/stable/`
```

## Testing a new SIP phone

Let's suppose you have received a brand new SIP phone that is not supported by the provisioning system of XiVO. You would like to know if it's possible to add auto-provisioning support for it. That said, you have never tested the phone before.

This guide will help you get through the different steps that are needed to add auto-provisioning support for a phone to XiVO.

## Prerequisites

Before continuing, you'll need the following:

- a private LAN where only your phones and your test machines are connected to it, i.e. a LAN that you fully control.

## Configuring a test environment

Although it's possible to do all the testing directly on a XiVO, it's more comfortable and usually easier to do on a separate, dedicated machine.

That said, you'll still need a XiVO near, since we'll be doing the call testing part on it and not on a separate asterisk.

So, for the rest of this guide, we'll suppose you are doing your tests on a *Debian Wheezy* with the following configuration:

- Installed packages:

```
isc-dhcp-server tftpd-hpa apache2
```

- Example content of the `/etc/dhcp/dhcpd.conf` file (restart `isc-dhcp-server` after modification):

```
ddns-update-style none;

default-lease-time 7200;
max-lease-time 86400;

log-facility local7;

subnet 10.34.1.0 netmask 255.255.255.0 {
    authoritative;

    range 10.34.1.200 10.34.1.250;

    option subnet-mask 255.255.255.0;
    option broadcast-address 10.34.1.255;
    option routers 10.34.1.6;

    option ntp-servers 10.34.1.6;
    option domain-name "my-domain.example.org";
    option domain-name-servers 10.34.1.6;

    log(concat("[VCI: ", option vendor-class-identifier, "]"));
}
```

- Example content of the `/etc/default/tftpd-hpa` file (restart `tftpd-hpa` after modification):

```
TFTP_USERNAME="tftp"
TFTP_DIRECTORY="/srv/tftp"
TFTP_ADDRESS="0.0.0.0:69"
TFTP_OPTIONS="--secure --verbose"
```

With this configuration, files served via TFTP will be in the `/srv/tftp` directory and those served via HTTP in the `/var/www` directory.

## Testing

Adding auto-provisioning support for a phone is mostly a question of finding answers to the following questions.

1. *Is it worth the time adding auto-provisioning support for the phone ?*

Indeed. Adding quality auto-provisioning support for a phone to XiVO requires a non negligible amount of work, if you don't meet any real problem and are comfortable with provisioning in XiVO. Not all phones are born equal. Some are cheap. Some are old and slow. Some are made to work on proprietary system and will only work in degraded mode on anything else.

That said, if you are uncertain, testing will help you clarifying your idea.

2. *What is the vendor, model, MAC address and firmware version (if available) of your phone ?*

Having the vendor and model name is essential when looking for documentation or other information. The MAC address will be needed later on for some tests, and it's always good to know the firmware version of the phone if you are trying to upgrade to a newer firmware version and you're having some troubles, and when reading the documentation.

3. *Is the official administrator guide/documentation available publicly on the vendor web site ? Is it available only after registering and login to the vendor web site ?*

Having access to the administrator guide/documentation of the phone is also essential. Once you've found it, download it and keep the link to the URL. If you can't find it, it's probably not worth going further.

4. *Is the latest firmware of the phone available publicly on the vendor web site ? Is it available only after registering and login to the vendor web site ?*

Good auto-provisioning support means you need to have an easy way to download the latest firmware of the phone. Ideally, this mean the firmware is downloadable from an URL, with no authentication whatsoever. In the worst case, you'll need to login on some web portal before being able to download the firmware, which will be cumbersome to automatize and probably fragile. If this is the case, it's probably not worth going further.

5. *Does the phone need other files, like language files ? If so, are these files available publicly on the vendor web site ? After registering ?*

Although you might not be able to answer to this question yet because you might not know if the phone needs such files to be either in English or in French (the two officially supported language in XiVO), you'll need to have an easy access to these files if its the case.

6. *Does the phone supports auto-provisioning via DHCP + HTTP (or TFTP) ?*

The provisioning system in XiVO is based on the popular method of using a DHCP server to tell the phone where to download its configuration files, and a HTTP (or TFTP) server to serve these configuration files. Some phones support other methods of provisioning (like TR-069), but that's of no use here. Also, if your phone is only configurable via its web interface, although it's technically possible to configure it automatically by navigating its web interface, it's an **extremely bad** idea since it's impossible to guarantee that you'll still be able to provision the phone on the next firmware release.

If the phone supports both HTTP and TFTP, pick HTTP, it usually works better with the provisioning server of XiVO.

7. *What are the default usernames/passwords on the phone to access administrator menus (phone UI and web UI) ? How do you do a factory reset of the phone ?*

Although this step is optional, it might be handy later to have these kind of information. Try to find them now, and note them somewhere.

8. *What are the DHCP options and their values to send to the phones to tell it where its configuration files are located ?*

Once you know that the phone supports DHCP + HTTP provisioning, the next question is what do you need to put in the DHCP response to tell the phone where its configuration files are located. Unless the admin documentation of the phone is really poor, this should not be too hard to find.

Once you have found this information, the easiest way to send it to the phone is to create a custom host declaration for the phone in the `/etc/dhcp/dhcpd.conf` file, like in this example:

```
host my-phone {
    hardware ethernet 00:11:22:33:44:55;
    option tftp-server-name "http://169.254.0.1/foobar.cfg";
}
```

9. *What are the configuration files the phone needs (filename and content) and what do we need to put in it for the phone to minimally be able to make and receive calls on XiVO ?*

Now that you are able to tell your phone where to look for its configuration files, you need to write these files with the right content in it. Again, at this step, you'll need to look through the documentation or examples to answer this question.

Note that you only want to have the most basic configuration here, i.e. only configure 1 line, with the right SIP registrar and proxy, and the associated username and password.

10. *Do basic telephony services, like transfer, works correctly when using the phone buttons ?*

On most phones, it's possible to do transfer (both attended and direct), three-way conferences or put someone on hold directly from the phone. Do some tests to see if it works correctly.

Also at this step, it's a good idea to check how the phone handle non-ascii characters, either in the caller ID or in its configuration files.

11. *Does other "standard" features work correctly on the phone ?*

For quality auto-provisioning support, you must find how to configure and make the following features work:

- NTP server
- MWI
- function keys (speed dial, BLF, directed pickup / call interception)
- timezone and DST support
- multi language
- DTMF
- hard keys, like the voicemail hard key on some phone
- non-ASCII labels (line name, function key label)
- non-ASCII caller ID
- backup proxy/registrar
- paging

Once you have answered all these questions, you'll have a good idea on how the phone works and how to configure it. Next step would be to start the development of a new provd plugin for your phone for a specific firmware version.

## Configuring a NAT Environment

This is a configuration example to simulate the case of a hosted XiVO, i.e. an environment where:

- the XiVO has a public IP address
- the phones are behind a NAT

In this example, we'll reproduce the following environment:

Where:

- the XiVO is installed inside a virtual machine
- the host machine is used as a router, a NAT and a DHCP server for the phones

Fig. 1.98: Phones behind a NAT

- the phones are in a separate VLAN than the XiVO, and when they want to interact with it, they must pass through the NAT

With this setup, we could also put some phones in the same VLAN as the XiVO. We would then have a mixed environment, where some phones are behind the NAT and some phones aren't.

Also, it's easy to go from a non-NAT environment to a NAT environment with this setup. What you usually have to do is only to switch your phone from the "XiVO" VLAN to the "phones" VLAN, and reconfiguring the lines on your XiVO.

The instruction in this page are written for Debian Wheezy and VirtualBox.

### Prerequisite

On the host machine:

- 1 VLAN network interface for the XiVO. In our example, this will be `eth0.341`, with IP 10.34.1.254/24.
- 1 VLAN network interface for the phones. In our example, this will be `eth0.342`, with IP 10.34.2.254/24.

On the guest machine, i.e. on the XiVO:

- 1 network adapter attached to the "XiVO" VLAN network interface. In our example, this interface inside the virtual machine will have the IP 10.34.1.1/24.

### Configuration

1. On the host, install the ISC DHCP server:

```
apt-get install isc-dhcp-server
```

2. If you do not want it to always be started:

```
update-rc.d isc-dhcp-server disable
```

3. Edit the DHCP server configuration file `/etc/dhcp/dhcpd.conf`. We need to configure the DHCP server to serve network configuration for the phones (Aastra and Snom in this case):

```
ddns-update-style none;

default-lease-time 3600;
max-lease-time 86400;

log-facility daemon;

option space Aastra6700;
option Aastra6700.cfg-server-name code 2 = text;
option Aastra6700.contact-rcs code 3 = boolean;

class "Aastra" {
    match if substring(option vendor-class-identifier, 0, 6) = "Aastra";

    vendor-option-space Aastra6700;
    option Aastra6700.cfg-server-name = "http://10.34.1.1:8667/Aastra";
    option Aastra6700.contact-rcs false;
}

class "Snom" {
    match if substring(option vendor-class-identifier, 0, 4) = "snom";

    option tftp-server-name = "http://10.34.1.1:8667";
    # the domain-name-servers option must be provided for the Snom 715 to work properly
    option domain-name-servers 10.34.1.1;
}

subnet 192.168.32.0 netmask 255.255.255.0 {
}

subnet 10.34.1.0 netmask 255.255.255.0 {
}

subnet 10.34.2.0 netmask 255.255.255.0 {
    authoritative;

    range 10.34.2.100 10.34.2.199;

    option subnet-mask 255.255.255.0;
    option broadcast-address 10.34.2.255;
    option routers 10.34.2.254;

    option ntp-servers 10.34.1.1;
}
```

4. If you have many network interfaces on your host machine, you might also want to edit `/etc/default/isc-dhcp-server` to only include the “phones” VLAN network interface in the “INTERFACES” variable.

5. Start the `isc-dhcp-server`:

```
service isc-dhcp-server start
```

6. Add an `iptables` rules to do NAT:

```
iptables -t nat -A POSTROUTING -o eth0.341 -j MASQUERADE
```

7. Make sure that IP forwarding is enabled:

```
sysctl -w net.ipv4.ip_forward=1
```

8. Put all the phones in the “phones” VLAN on your switch
9. Activate the NAT and Monitoring options on the *Services* → *IPBX* → *General settings* → *SIP Protocol* page of your XiVO.

Note that the iptables rules and the IP forwarding setting are not persistent. If you don't make them persistent (not documented here), don't forget to reactivate them each time you want to recreate a NAT environment.

## 1.12.15 SCCP

### Introduction

SCCP (or skinny) is a stimulus protocol used to fully interact with Cisco phones.

What is xivo-libsccp ? It's a SCCP channel driver written for Asterisk by Avencall based on the channel skinny.

### Installation

The following packages are required to compile xivo-libsccp on a XiVO.

- build-essential
- asterisk-dev

```
apt-get update && apt-get install build-essential asterisk-dev
```

```
git clone https://github.com/xivo-pbx/xivo-libsccp.git
cd xivo-libsccp/xivo-libsccp/
make
make install
```

### Configuration

See [sccp.conf.sample](#) for a configuration file example.

### FAQ

Q. When is this \*feature X\* will be available?

A. The order in which we implement features is based on our client needs. Write us an email that clearly explain your setup and what you would like to do and we will see what we can do. We don't provide any timeline.

Q. I want to use the Page() application to call many phones at the same time.

A. Here a Page() example for a one way call (half-duplex):

```
exten => 1000,1,Verbose(2, Paging to external cisco phone)
same => n,Page(sccp/100/autoanswer&sccp/101/autoanswer,i,120 )
```

...for a two-way call (full-duplex):

```
exten => 1000,1,Verbose(2, Paging to external cisco phone)
same => n,Page(sccp/100/autoanswer&sccp/101/autoanswer,di,120 )
```

### Network Configuration for 7920/7921

Here's how to configure a hostapd based AP on a Debian host so that both a 7920 and 7921 Wi-Fi phone can connect to it.

The 7920 is older than the 7921 and is pretty limited in its Wi-Fi fonctionnality:

- 802.11b
- WPA (no WPA2)

- TKIP (no CCMP/AES)

Which means that the most secure WLAN you can set up if you want both phones to connect to it is not that secure.

1. Make sure you have a wireless NIC capable of master mode.
2. If needed, install the firmware-<vendor> package. For example, if you have a ralink card like I do:

```
apt-get install firmware-ralink
```

3. Install the other dependencies:

```
apt-get install wireless-tools hostapd bridge-utils
```

4. Create an hostapd configuration file in /etc/hostapd/hostapd.sccp.conf with content:

```
##### hostapd configuration file #####
# Empty lines and lines starting with # are ignored

# AP netdevice name (without 'ap' postfix, i.e., wlan0 uses wlan0ap for
# management frames); ath0 for madwifi
interface=wlan0

# In case of madwifi, atheros, and nl80211 driver interfaces, an additional
# configuration parameter, bridge, may be used to notify hostapd if the
# interface is included in a bridge. This parameter is not used with Host AP
# driver. If the bridge parameter is not set, the drivers will automatically
# figure out the bridge interface (assuming sysfs is enabled and mounted to
# /sys) and this parameter may not be needed.
#
# For nl80211, this parameter can be used to request the AP interface to be
# added to the bridge automatically (brctl may refuse to do this before hostapd
# has been started to change the interface mode). If needed, the bridge
# interface is also created.
#bridge=br0

# Driver interface type (hostap/wired/madwifi/test/none/nl80211/bsd);
# default: hostap). nl80211 is used with all Linux mac80211 drivers.
# Use driver=none if building hostapd as a standalone RADIUS server that does
# not control any wireless/wired driver.
# driver=hostap

# hostapd event logger configuration
#
# Two output method: syslog and stdout (only usable if not forking to
# background).
#
# Module bitfield (ORed bitfield of modules that will be logged; -1 = all
# modules):
# bit 0 (1) = IEEE 802.11
# bit 1 (2) = IEEE 802.1X
# bit 2 (4) = RADIUS
# bit 3 (8) = WPA
# bit 4 (16) = driver interface
# bit 5 (32) = IAPP
# bit 6 (64) = MLME
#
# Levels (minimum value for logged events):
# 0 = verbose debugging
# 1 = debugging
# 2 = informational messages
# 3 = notification
# 4 = warning
#
```

```

logger_syslog=-1
logger_syslog_level=2
logger_stdout=-1
logger_stdout_level=2

# Dump file for state information (on SIGUSR1)
dump_file=/tmp/hostapd.dump

# Interface for separate control program. If this is specified, hostapd
# will create this directory and a UNIX domain socket for listening to requests
# from external programs (CLI/GUI, etc.) for status information and
# configuration. The socket file will be named based on the interface name, so
# multiple hostapd processes/interfaces can be run at the same time if more
# than one interface is used.
# /var/run/hostapd is the recommended directory for sockets and by default,
# hostapd_cli will use it when trying to connect with hostapd.
ctrl_interface=/var/run/hostapd

# Access control for the control interface can be configured by setting the
# directory to allow only members of a group to use sockets. This way, it is
# possible to run hostapd as root (since it needs to change network
# configuration and open raw sockets) and still allow GUI/CLI components to be
# run as non-root users. However, since the control interface can be used to
# change the network configuration, this access needs to be protected in many
# cases. By default, hostapd is configured to use gid 0 (root). If you
# want to allow non-root users to use the control interface, add a new group
# and change this value to match with that group. Add users that should have
# control interface access to this group.
#
# This variable can be a group name or gid.
#ctrl_interface_group=wheel
ctrl_interface_group=0

##### IEEE 802.11 related configuration #####

# SSID to be used in IEEE 802.11 management frames
ssid=example-ssid

# Country code (ISO/IEC 3166-1). Used to set regulatory domain.
# Set as needed to indicate country in which device is operating.
# This can limit available channels and transmit power.
country_code=CA

# Enable IEEE 802.11d. This advertises the country_code and the set of allowed
# channels and transmit power levels based on the regulatory limits. The
# country_code setting must be configured with the correct country for
# IEEE 802.11d functions.
# (default: 0 = disabled)
#ieee80211d=1

# Operation mode (a = IEEE 802.11a, b = IEEE 802.11b, g = IEEE 802.11g,
# Default: IEEE 802.11b
# 7920 only supports b
hw_mode=b

# Channel number (IEEE 802.11)
# (default: 0, i.e., not set)
# Please note that some drivers do not use this value from hostapd and the
# channel will need to be configured separately with iwconfig.
channel=5

# Beacon interval in us (1.024 ms) (default: 100; range 15..65535)

```

```
beacon_int=100

# DTIM (delivery traffic information message) period (range 1..255):
# number of beacons between DTIMs (1 = every beacon includes DTIM element)
# (default: 2)
dtim_period=2

# Maximum number of stations allowed in station table. New stations will be
# rejected after the station table is full. IEEE 802.11 has a limit of 2007
# different association IDs, so this number should not be larger than that.
# (default: 2007)
max_num_sta=255

# RTS/CTS threshold; 2347 = disabled (default); range 0..2347
# If this field is not included in hostapd.conf, hostapd will not control
# RTS threshold and 'iwconfig wlan# rts <val>' can be used to set it.
rts_threshold=2347

# Fragmentation threshold; 2346 = disabled (default); range 256..2346
# If this field is not included in hostapd.conf, hostapd will not control
# fragmentation threshold and 'iwconfig wlan# frag <val>' can be used to set
# it.
fragm_threshold=2346

# Rate configuration
# Default is to enable all rates supported by the hardware. This configuration
# item allows this list be filtered so that only the listed rates will be left
# in the list. If the list is empty, all rates are used. This list can have
# entries that are not in the list of rates the hardware supports (such entries
# are ignored). The entries in this list are in 100 kbps, i.e., 11 Mbps = 110.
# If this item is present, at least one rate have to be matching with the rates
# hardware supports.
# default: use the most common supported rate setting for the selected
# hw_mode (i.e., this line can be removed from configuration file in most
# cases)
#supported_rates=10 20 55 110 60 90 120 180 240 360 480 540

# Basic rate set configuration
# List of rates (in 100 kbps) that are included in the basic rate set.
# If this item is not included, usually reasonable default set is used.
#basic_rates=10 20
#basic_rates=10 20 55 110
#basic_rates=60 120 240

# Short Preamble
# This parameter can be used to enable optional use of short preamble for
# frames sent at 2 Mbps, 5.5 Mbps, and 11 Mbps to improve network performance.
# This applies only to IEEE 802.11b-compatible networks and this should only be
# enabled if the local hardware supports use of short preamble. If any of the
# associated STAs do not support short preamble, use of short preamble will be
# disabled (and enabled when such STAs disassociate) dynamically.
# 0 = do not allow use of short preamble (default)
# 1 = allow use of short preamble
#preamble=1

# Station MAC address -based authentication
# Please note that this kind of access control requires a driver that uses
# hostapd to take care of management frame processing and as such, this can be
# used with driver=hostap or driver=nl80211, but not with driver=madwifi.
# 0 = accept unless in deny list
# 1 = deny unless in accept list
# 2 = use external RADIUS server (accept/deny lists are searched first)
macaddr_acl=0
```

```

# Accept/deny lists are read from separate files (containing list of
# MAC addresses, one per line). Use absolute path name to make sure that the
# files can be read on SIGHUP configuration reloads.
#accept_mac_file=/etc/hostapd.accept
#deny_mac_file=/etc/hostapd.deny

# IEEE 802.11 specifies two authentication algorithms. hostapd can be
# configured to allow both of these or only one. Open system authentication
# should be used with IEEE 802.1X.
# Bit fields of allowed authentication algorithms:
# bit 0 = Open System Authentication
# bit 1 = Shared Key Authentication (requires WEP)
auth_algs=1

# Send empty SSID in beacons and ignore probe request frames that do not
# specify full SSID, i.e., require stations to know SSID.
# default: disabled (0)
# 1 = send empty (length=0) SSID in beacon and ignore probe request for
#     broadcast SSID
# 2 = clear SSID (ASCII 0), but keep the original length (this may be required
#     with some clients that do not support empty SSID) and ignore probe
#     requests for broadcast SSID
ignore_broadcast_ssid=0

# TX queue parameters (EDCF / bursting)
# tx_queue_<queue name>_<param>
# queues: data0, data1, data2, data3, after_beacon, beacon

# Static WEP key configuration
#
# The key number to use when transmitting.
# It must be between 0 and 3, and the corresponding key must be set.
# default: not set
#wep_default_key=0
# The WEP keys to use.
# A key may be a quoted string or unquoted hexadecimal digits.
# The key length should be 5, 13, or 16 characters, or 10, 26, or 32
# digits, depending on whether 40-bit (64-bit), 104-bit (128-bit), or
# 128-bit (152-bit) WEP is used.
# Only the default key must be supplied; the others are optional.
# default: not set
#wep_key0=123456789a
#wep_key1="vwxyz"
#wep_key2=0102030405060708090a0b0c0d
#wep_key3=".2.4.6.8.0.23"

# Station inactivity limit
#
# If a station does not send anything in ap_max_inactivity seconds, an
# empty data frame is sent to it in order to verify whether it is
# still in range. If this frame is not ACKed, the station will be
# disassociated and then deauthenticated. This feature is used to
# clear station table of old entries when the STAs move out of the
# range.
#
# The station can associate again with the AP if it is still in range;
# this inactivity poll is just used as a nicer way of verifying
# inactivity; i.e., client will not report broken connection because
# disassociation frame is not sent immediately without first polling
# the STA with a data frame.
# default: 300 (i.e., 5 minutes)
#ap_max_inactivity=300

# Disassociate stations based on excessive transmission failures or other
# indications of connection loss. This depends on the driver capabilities and
# may not be available with all drivers.
#disassoc_low_ack=1

# Maximum allowed Listen Interval (how many Beacon periods STAs are allowed to
# remain asleep). Default: 65535 (no limit apart from field size)
#max_listen_interval=100

# WDS (4-address frame) mode with per-station virtual interfaces
# (only supported with driver=nl80211)
# This mode allows associated stations to use 4-address frames to allow layer 2
# bridging to be used.
#wds_sta=1

# If bridge parameter is set, the WDS STA interface will be added to the same
# bridge by default. This can be overridden with the wds_bridge parameter to
# use a separate bridge.
#wds_bridge=wds-br0

```

```

# Client isolation can be used to prevent low-level bridging of frames between
# associated stations in the BSS. By default, this bridging is allowed.
#ap_isolate=1

##### IEEE 802.11n related configuration #####

# ieee80211n: Whether IEEE 802.11n (HT) is enabled
# 0 = disabled (default)
# 1 = enabled
# Note: You will also need to enable WMM for full HT functionality.
#ieee80211n=1

# ht_capab: HT capabilities (list of flags)
# LDPC coding capability: [LDPC] = supported
# Supported channel width set: [HT40-] = both 20 MHz and 40 MHz with secondary
# channel below the primary channel; [HT40+] = both 20 MHz and 40 MHz
# with secondary channel below the primary channel
# (20 MHz only if neither is set)
# Note: There are limits on which channels can be used with HT40- and
# HT40+. Following table shows the channels that may be available for
# HT40- and HT40+ use per IEEE 802.11n Annex J:
# freq          HT40-          HT40+
# 2.4 GHz       5-13          1-7 (1-9 in Europe/Japan)
# 5 GHz         40,48,56,64    36,44,52,60
# (depending on the location, not all of these channels may be available
# for use)
# Please note that 40 MHz channels may switch their primary and secondary
# channels if needed or creation of 40 MHz channel maybe rejected based
# on overlapping BSSes. These changes are done automatically when hostapd
# is setting up the 40 MHz channel.
# Spatial Multiplexing (SM) Power Save: [SMPS-STATIC] or [SMPS-DYNAMIC]
# (SMPS disabled if neither is set)
# HT-greenfield: [GF] (disabled if not set)
# Short GI for 20 MHz: [SHORT-GI-20] (disabled if not set)
# Short GI for 40 MHz: [SHORT-GI-40] (disabled if not set)
# Tx STBC: [TX-STBC] (disabled if not set)
# Rx STBC: [RX-STBC1] (one spatial stream), [RX-STBC12] (one or two spatial
# streams), or [RX-STBC123] (one, two, or three spatial streams); Rx STBC
# disabled if none of these set
# HT-delayed Block Ack: [DELAYED-BA] (disabled if not set)
# Maximum A-MSDU length: [MAX-AMSDU-7935] for 7935 octets (3839 octets if not
# set)
# DSSS/CCK Mode in 40 MHz: [DSSS_CCK-40] = allowed (not allowed if not set)
# PSMP support: [PSMP] (disabled if not set)
# L-SIG TXOP protection support: [LSIG-TXOP-PROT] (disabled if not set)
#ht_capab=[HT40-][SHORT-GI-20][SHORT-GI-40]

# Require stations to support HT PHY (reject association if they do not)
#require_ht=1

##### IEEE 802.1X-2004 related configuration #####

# Require IEEE 802.1X authorization
#ieee8021x=1

# IEEE 802.1X/EAPOL version
# hostapd is implemented based on IEEE Std 802.1X-2004 which defines EAPOL
# version 2. However, there are many client implementations that do not handle
# the new version number correctly (they seem to drop the frames completely).
# In order to make hostapd interoperate with these clients, the version number
# can be set to the older version (1) with this configuration value.
#eapol_version=2

```

```

# Optional displayable message sent with EAP Request-Identity. The first \0
# in this string will be converted to ASCII-0 (nul). This can be used to
# separate network info (comma separated list of attribute=value pairs); see,
# e.g., RFC 4284.
#eap_message=hello
#eap_message=hello\0networkid=netw,nasid=foo,portid=0,NAIRealms=example.com

# WEP rekeying (disabled if key lengths are not set or are set to 0)
# Key lengths for default/broadcast and individual/unicast keys:
# 5 = 40-bit WEP (also known as 64-bit WEP with 40 secret bits)
# 13 = 104-bit WEP (also known as 128-bit WEP with 104 secret bits)
#wep_key_len_broadcast=5
#wep_key_len_unicast=5
# Rekeying period in seconds. 0 = do not rekey (i.e., set keys only once)
#wep_rekey_period=300

# EAPOL-Key index workaround (set bit7) for WinXP Supplicant (needed only if
# only broadcast keys are used)
eapol_key_index_workaround=0

# EAP reauthentication period in seconds (default: 3600 seconds; 0 = disable
# reauthentication).
#eap_reauth_period=3600

# Use PAE group address (01:80:c2:00:00:03) instead of individual target
# address when sending EAPOL frames with driver=wired. This is the most common
# mechanism used in wired authentication, but it also requires that the port
# is only used by one station.
#use_pae_group_addr=1

##### Integrated EAP server #####

# Optionally, hostapd can be configured to use an integrated EAP server
# to process EAP authentication locally without need for an external RADIUS
# server. This functionality can be used both as a local authentication server
# for IEEE 802.1X/EAPOL and as a RADIUS server for other devices.

# Use integrated EAP server instead of external RADIUS authentication
# server. This is also needed if hostapd is configured to act as a RADIUS
# authentication server.
eap_server=0

# Path for EAP server user database
#eap_user_file=/etc/hostapd.eap_user

# CA certificate (PEM or DER file) for EAP-TLS/PEAP/TTLS
#ca_cert=/etc/hostapd.ca.pem

# Server certificate (PEM or DER file) for EAP-TLS/PEAP/TTLS
#server_cert=/etc/hostapd.server.pem

# Private key matching with the server certificate for EAP-TLS/PEAP/TTLS
# This may point to the same file as server_cert if both certificate and key
# are included in a single file. PKCS#12 (PFX) file (.p12/.pfx) can also be
# used by commenting out server_cert and specifying the PFX file as the
# private_key.
#private_key=/etc/hostapd.server.prv

# Passphrase for private key
#private_key_passwd=secret passphrase

# Enable CRL verification.
# Note: hostapd does not yet support CRL downloading based on CDP. Thus, a

```

```
# valid CRL signed by the CA is required to be included in the ca_cert file.
# This can be done by using PEM format for CA certificate and CRL and
# concatenating these into one file. Whenever CRL changes, hostapd needs to be
# restarted to take the new CRL into use.
# 0 = do not verify CRLs (default)
# 1 = check the CRL of the user certificate
# 2 = check all CRLs in the certificate path
#check_crl=1

# dh_file: File path to DH/DSA parameters file (in PEM format)
# This is an optional configuration file for setting parameters for an
# ephemeral DH key exchange. In most cases, the default RSA authentication does
# not use this configuration. However, it is possible setup RSA to use
# ephemeral DH key exchange. In addition, ciphers with DSA keys always use
# ephemeral DH keys. This can be used to achieve forward secrecy. If the file
# is in DSA parameters format, it will be automatically converted into DH
# params. This parameter is required if anonymous EAP-FAST is used.
# You can generate DH parameters file with OpenSSL, e.g.,
# "openssl dhparam -out /etc/hostapd.dh.pem 1024"
#dh_file=/etc/hostapd.dh.pem

# Fragment size for EAP methods
#fragment_size=1400

# Configuration data for EAP-SIM database/authentication gateway interface.
# This is a text string in implementation specific format. The example
# implementation in eap_sim_db.c uses this as the UNIX domain socket name for
# the HLR/AuC gateway (e.g., hlr_auc_gw). In this case, the path uses "unix:"
# prefix.
#eap_sim_db=unix:/tmp/hlr_auc_gw.sock

# Encryption key for EAP-FAST PAC-Opaque values. This key must be a secret,
# random value. It is configured as a 16-octet value in hex format. It can be
# generated, e.g., with the following command:
# od -tx1 -v -N16 /dev/random | colrm 1 8 | tr -d ' '
#pac_opaque_encr_key=000102030405060708090a0b0c0d0e0f

# EAP-FAST authority identity (A-ID)
# A-ID indicates the identity of the authority that issues PACs. The A-ID
# should be unique across all issuing servers. In theory, this is a variable
# length field, but due to some existing implementations requiring A-ID to be
# 16 octets in length, it is strongly recommended to use that length for the
# field to provid interoperability with deployed peer implementations. This
# field is configured in hex format.
#eap_fast_a_id=101112131415161718191a1b1c1d1e1f

# EAP-FAST authority identifier information (A-ID-Info)
# This is a user-friendly name for the A-ID. For example, the enterprise name
# and server name in a human-readable format. This field is encoded as UTF-8.
#eap_fast_a_id_info=test server

# Enable/disable different EAP-FAST provisioning modes:
#0 = provisioning disabled
#1 = only anonymous provisioning allowed
#2 = only authenticated provisioning allowed
#3 = both provisioning modes allowed (default)
#eap_fast_prov=3

# EAP-FAST PAC-Key lifetime in seconds (hard limit)
#pac_key_lifetime=604800

# EAP-FAST PAC-Key refresh time in seconds (soft limit on remaining hard
# limit). The server will generate a new PAC-Key when this number of seconds
```

```

# (or fewer) of the lifetime remains.
#pac_key_refresh_time=86400

# EAP-SIM and EAP-AKA protected success/failure indication using AT_RESULT_IND
# (default: 0 = disabled).
#eap_sim_aka_result_ind=1

# Trusted Network Connect (TNC)
# If enabled, TNC validation will be required before the peer is allowed to
# connect. Note: This is only used with EAP-TTLS and EAP-FAST. If any other
# EAP method is enabled, the peer will be allowed to connect without TNC.
#tnc=1

##### IEEE 802.11f - Inter-Access Point Protocol (IAPP) #####

# Interface to be used for IAPP broadcast packets
#iapp_interface=eth0

##### RADIUS client configuration #####
# for IEEE 802.1X with external Authentication Server, IEEE 802.11
# authentication with external ACL for MAC addresses, and accounting

# The own IP address of the access point (used as NAS-IP-Address)
own_ip_addr=127.0.0.1

# Optional NAS-Identifier string for RADIUS messages. When used, this should be
# a unique to the NAS within the scope of the RADIUS server. For example, a
# fully qualified domain name can be used here.
# When using IEEE 802.11r, nas_identifier must be set and must be between 1 and
# 48 octets long.
#nas_identifier=ap.example.com

# RADIUS authentication server
#auth_server_addr=127.0.0.1
#auth_server_port=1812
#auth_server_shared_secret=secret

# RADIUS accounting server
#acct_server_addr=127.0.0.1
#acct_server_port=1813
#acct_server_shared_secret=secret

# Secondary RADIUS servers; to be used if primary one does not reply to
# RADIUS packets. These are optional and there can be more than one secondary
# server listed.
#auth_server_addr=127.0.0.2
#auth_server_port=1812
#auth_server_shared_secret=secret2
#
#acct_server_addr=127.0.0.2
#acct_server_port=1813
#acct_server_shared_secret=secret2

# Retry interval for trying to return to the primary RADIUS server (in
# seconds). RADIUS client code will automatically try to use the next server
# when the current server is not replying to requests. If this interval is set,
# primary server will be retried after configured amount of time even if the
# currently used secondary server is still working.
#radius_retry_primary_interval=600

```

```
# Interim accounting update interval
# If this is set (larger than 0) and acct_server is configured, hostapd will
# send interim accounting updates every N seconds. Note: if set, this overrides
# possible Acct-Interim-Interval attribute in Access-Accept message. Thus, this
# value should not be configured in hostapd.conf, if RADIUS server is used to
# control the interim interval.
# This value should not be less 600 (10 minutes) and must not be less than
# 60 (1 minute).
#radius_acct_interim_interval=600

# Dynamic VLAN mode; allow RADIUS authentication server to decide which VLAN
# is used for the stations. This information is parsed from following RADIUS
# attributes based on RFC 3580 and RFC 2868: Tunnel-Type (value 13 = VLAN),
# Tunnel-Medium-Type (value 6 = IEEE 802), Tunnel-Private-Group-ID (value
# VLANID as a string). vlan_file option below must be configured if dynamic
# VLANs are used. Optionally, the local MAC ACL list (accept_mac_file) can be
# used to set static client MAC address to VLAN ID mapping.
# 0 = disabled (default)
# 1 = option; use default interface if RADIUS server does not include VLAN ID
# 2 = required; reject authentication if RADIUS server does not include VLAN ID
#dynamic_vlan=0

# VLAN interface list for dynamic VLAN mode is read from a separate text file.
# This list is used to map VLAN ID from the RADIUS server to a network
# interface. Each station is bound to one interface in the same way as with
# multiple BSSIDs or SSIDs. Each line in this text file is defining a new
# interface and the line must include VLAN ID and interface name separated by
# white space (space or tab).
#vlan_file=/etc/hostapd.vlan

# Interface where 802.1q tagged packets should appear when a RADIUS server is
# used to determine which VLAN a station is on. hostapd creates a bridge for
# each VLAN. Then hostapd adds a VLAN interface (associated with the interface
# indicated by 'vlan_tagged_interface') and the appropriate wireless interface
# to the bridge.
#vlan_tagged_interface=eth0

##### RADIUS authentication server configuration #####

# hostapd can be used as a RADIUS authentication server for other hosts. This
# requires that the integrated EAP server is also enabled and both
# authentication services are sharing the same configuration.

# File name of the RADIUS clients configuration for the RADIUS server. If this
# commented out, RADIUS server is disabled.
#radius_server_clients=/etc/hostapd.radius_clients

# The UDP port number for the RADIUS authentication server
#radius_server_auth_port=1812

# Use IPv6 with RADIUS server (IPv4 will also be supported using IPv6 API)
#radius_server_ipv6=1

##### WPA/IEEE 802.11i configuration #####

# Enable WPA. Setting this variable configures the AP to require WPA (either
# WPA-PSK or WPA-RADIUS/EAP based on other configuration). For WPA-PSK, either
# wpa_psk or wpa_passphrase must be set and wpa_key_mgmt must include WPA-PSK.
# For WPA-RADIUS/EAP, ieee8021x must be set (but without dynamic WEP keys),
# RADIUS authentication server must be configured, and WPA-EAP must be included
# in wpa_key_mgmt.
```

```

# This field is a bit field that can be used to enable WPA (IEEE 802.11i/D3.0)
# and/or WPA2 (full IEEE 802.11i/RSN):
# bit0 = WPA
# bit1 = IEEE 802.11i/RSN (WPA2) (dot11RSNAEnabled)
# 7920 doesn't support WPA2
wpa=1

# WPA pre-shared keys for WPA-PSK. This can be either entered as a 256-bit
# secret in hex format (64 hex digits), wpa_psk, or as an ASCII passphrase
# (8..63 characters) that will be converted to PSK. This conversion uses SSID
# so the PSK changes when ASCII passphrase is used and the SSID is changed.
# wpa_psk (dot11RSNAConfigPSKValue)
# wpa_passphrase (dot11RSNAConfigPSKPassPhrase)
#wpa_psk=0123456789abcdef0123456789abcdef0123456789abcdef0123456789abcdef
wpa_passphrase=example-password

# Optionally, WPA PSKs can be read from a separate text file (containing list
# of (PSK,MAC address) pairs. This allows more than one PSK to be configured.
# Use absolute path name to make sure that the files can be read on SIGHUP
# configuration reloads.
#wpa_psk_file=/etc/hostapd.wpa_psk

# Set of accepted key management algorithms (WPA-PSK, WPA-EAP, or both). The
# entries are separated with a space. WPA-PSK-SHA256 and WPA-EAP-SHA256 can be
# added to enable SHA256-based stronger algorithms.
# (dot11RSNAConfigAuthenticationSuitesTable)
wpa_key_mgmt=WPA-PSK

# Set of accepted cipher suites (encryption algorithms) for pairwise keys
# (unicast packets). This is a space separated list of algorithms:
# CCMP = AES in Counter mode with CBC-MAC [RFC 3610, IEEE 802.11i/D7.0]
# TKIP = Temporal Key Integrity Protocol [IEEE 802.11i/D7.0]
# Group cipher suite (encryption algorithm for broadcast and multicast frames)
# is automatically selected based on this configuration. If only CCMP is
# allowed as the pairwise cipher, group cipher will also be CCMP. Otherwise,
# TKIP will be used as the group cipher.
# (dot11RSNAConfigPairwiseCiphersTable)
# Pairwise cipher for WPA (v1) (default: TKIP)
# 7920 only supports TKIP
wpa_pairwise=TKIP
# Pairwise cipher for RSN/WPA2 (default: use wpa_pairwise value)
#rsn_pairwise=CCMP

# Time interval for rekeying GTK (broadcast/multicast encryption keys) in
# seconds. (dot11RSNAConfigGroupRekeyTime)
#wpa_group_rekey=600

# Rekey GTK when any STA that possesses the current GTK is leaving the BSS.

# PMK-R1 key from the R0KH. This is also the list of authorized R1KHs in the MD
# that can request PMK-R1 keys.
#r1kh=02:01:02:03:04:05 02:11:22:33:44:55 000102030405060708090a0b0c0d0e0f
#r1kh=02:01:02:03:04:06 02:11:22:33:44:66 00112233445566778899aabbccddeeff
# And so on.. One line per R1KH.

# Whether PMK-R1 push is enabled at R0KH
# 0 = do not push PMK-R1 to all configured R1KHs (default)
# 1 = push PMK-R1 to all configured R1KHs whenever a new PMK-R0 is derived
#pmk_r1_push=1

##### Neighbor table #####
# Maximum number of entries kept in AP table (either for neighbor table or for
# detecting Overlapping Legacy BSS Condition). The oldest entry will be
# removed when adding a new entry that would make the list grow over this
# limit. Note! WFA certification for IEEE 802.11g requires that OLBC is
# enabled, so this field should not be set to 0 when using IEEE 802.11g.
# default: 255
#ap_table_max_size=255

# Number of seconds of no frames received after which entries may be deleted
# from the AP table. Since passive scanning is not usually performed frequently
# this should not be set to very small value. In addition, there is no
# guarantee that every scan cycle will receive beacon frames from the
# neighboring APs.
# default: 60
#ap_table_expiration_time=3600

##### Wi-Fi Protected Setup (WPS) #####

# WPS state
# 0 = WPS disabled (default)
# 1 = WPS enabled, not configured
# 2 = WPS enabled, configured
#wps_state=2

# AP can be configured into a locked state where new WPS Registrar are not
# accepted, but previously authorized Registrars (including the internal one)
# can continue to add new Enrollees.
#ap_setup_locked=1

```

```
# Universally Unique IDentifier (UUID; see RFC 4122) of the device
# This value is used as the UUID for the internal WPS Registrar. If the AP
# is also using UPnP, this value should be set to the device's UPnP UUID.
# If not configured, UUID will be generated based on the local MAC address.
#uuid=12345678-9abc-def0-1234-56789abcdef0

# Note: If wpa_psk_file is set, WPS is used to generate random, per-device PSKs
# that will be appended to the wpa_psk_file. If wpa_psk_file is not set, the
# default PSK (wpa_psk/wpa_passphrase) will be delivered to Enrollees. Use of
# per-device PSKs is recommended as the more secure option (i.e., make sure to
# set wpa_psk_file when using WPS with WPA-PSK).

# When an Enrollee requests access to the network with PIN method, the Enrollee
# PIN will need to be entered for the Registrar. PIN request notifications are
# sent to hostapd ctrl_iface monitor. In addition, they can be written to a
# text file that could be used, e.g., to populate the AP administration UI with
# pending PIN requests. If the following variable is set, the PIN requests will
# be written to the configured file.
#wps_pin_requests=/var/run/hostapd_wps_pin_requests

# Device Name
# User-friendly description of device; up to 32 octets encoded in UTF-8
#device_name=Wireless AP

# Manufacturer
# The manufacturer of the device (up to 64 ASCII characters)
#manufacturer=Company

# Model Name
# Model of the device (up to 32 ASCII characters)
#model_name=WAP

# Model Number
# Additional device description (up to 32 ASCII characters)
#model_number=123

# Serial Number
# Serial number of the device (up to 32 characters)
#serial_number=12345

# Primary Device Type
# Used format: <categ>-<OUI>-<subcateg>
# categ = Category as an integer value
# OUI = OUI and type octet as a 4-octet hex-encoded value; 0050F204 for
#         default WPS OUI
# subcateg = OUI-specific Sub Category as an integer value
# Examples:
#   1-0050F204-1 (Computer / PC)
#   1-0050F204-2 (Computer / Server)
#   5-0050F204-1 (Storage / NAS)
#   6-0050F204-1 (Network Infrastructure / AP)
#device_type=6-0050F204-1

# OS Version
# 4-octet operating system version number (hex string)
#os_version=01020300

# Config Methods
# List of the supported configuration methods
# Available methods: usba ethernet label display ext_nfc_token int_nfc_token
# nfc_interface push_button keypad virtual_display physical_display
# virtual_push_button physical_push_button
```

```
#config_methods=label virtual_display virtual_push_button keypad

# WPS capability discovery workaround for PBC with Windows 7
# Windows 7 uses incorrect way of figuring out AP's WPS capabilities by acting
# as a Registrar and using M1 from the AP. The config_methods attribute in that
# message is supposed to indicate only the configuration method supported by
# the AP in Enrollee role, i.e., to add an external Registrar. For that case,
# PBC shall not be used and as such, the PushButton config method is removed
# from M1 by default. If pbc_in_m1=1 is included in the configuration file,
# the PushButton config method is left in M1 (if included in config_methods
# parameter) to allow Windows 7 to use PBC instead of PIN (e.g., from a label
# in the AP).
#pbc_in_m1=1

# Static access point PIN for initial configuration and adding Registrars
# If not set, hostapd will not allow external WPS Registrars to control the
# access point. The AP PIN can also be set at runtime with hostapd_cli
# wps_ap_pin command. Use of temporary (enabled by user action) and random
# AP PIN is much more secure than configuring a static AP PIN here. As such,
# use of the ap_pin parameter is not recommended if the AP device has means for
# displaying a random PIN.
#ap_pin=12345670

# Skip building of automatic WPS credential
# This can be used to allow the automatically generated Credential attribute to
# be replaced with pre-configured Credential(s).
#skip_cred_build=1

# Additional Credential attribute(s)
# This option can be used to add pre-configured Credential attributes into M8
# message when acting as a Registrar. If skip_cred_build=1, this data will also
# be able to override the Credential attribute that would have otherwise been
# automatically generated based on network configuration. This configuration
# option points to an external file that much contain the WPS Credential
# attribute(s) as binary data.
#extra_cred=hostapd.cred

# Credential processing
# 0 = process received credentials internally (default)
# 1 = do not process received credentials; just pass them over ctrl_iface to
# external program(s)
# 2 = process received credentials internally and pass them over ctrl_iface
# to external program(s)
# Note: With wps_cred_processing=1, skip_cred_build should be set to 1 and
# extra_cred be used to provide the Credential data for Enrollees.
#
# wps_cred_processing=1 will disabled automatic updates of hostapd.conf file
# both for Credential processing and for marking AP Setup Locked based on
# validation failures of AP PIN. An external program is responsible on updating
# the configuration appropriately in this case.
#wps_cred_processing=0

# AP Settings Attributes for M7
# By default, hostapd generates the AP Settings Attributes for M7 based on the
# current configuration. It is possible to override this by providing a file
# with pre-configured attributes. This is similar to extra_cred file format,
# but the AP Settings attributes are not encapsulated in a Credential
# attribute.
#ap_settings=hostapd.ap_settings

# WPS UPnP interface
# If set, support for external Registrars is enabled.
#upnp_iface=br0
```

```
# Friendly Name (required for UPnP)
# Short description for end use. Should be less than 64 characters.
#friendly_name=WPS Access Point

# Manufacturer URL (optional for UPnP)
#manufacturer_url=http://www.example.com/

# Model Description (recommended for UPnP)
# Long description for end user. Should be less than 128 characters.
#model_description=Wireless Access Point

# Model URL (optional for UPnP)
#model_url=http://www.example.com/model/

# Universal Product Code (optional for UPnP)
# 12-digit, all-numeric code that identifies the consumer package.
#upc=123456789012

##### Wi-Fi Direct (P2P) #####

# Enable P2P Device management
#manage_p2p=1

# Allow cross connection
#allow_cross_connection=1

#### TDLS (IEEE 802.11z-2010) #####

# Prohibit use of TDLS in this BSS
#tdls_prohibit=1

# Prohibit use of TDLS Channel Switching in this BSS
#tdls_prohibit_chan_switch=1

##### IEEE 802.11v-2011 #####

# Time advertisement
# 0 = disabled (default)
# 2 = UTC time at which the TSF timer is 0
#time_advertisement=2

# Local time zone as specified in 8.3 of IEEE Std 1003.1-2004:
# stdoffset[dst[offset][,start[/time],end[/time]]]
#time_zone=EST5

##### IEEE 802.11u-2011 #####

# Enable Interworking service
#interworking=1

# Access Network Type
# 0 = Private network
# 1 = Private network with guest access
# 2 = Chargeable public network
# 3 = Free public network
# 4 = Personal device network
# 5 = Emergency services only network
# 14 = Test or experimental
# 15 = Wildcard
#access_network_type=0

# Whether the network provides connectivity to the Internet
```

```

# 0 = Unspecified
# 1 = Network provides connectivity to the Internet
#internet=1

# Additional Step Required for Access
# Note: This is only used with open network, i.e., ASRA shall ne set to 0 if
# RSN is used.
#asra=0

# Emergency services reachable
#esr=0

# Unauthenticated emergency service accessible
#uesa=0

# Venue Info (optional)
# The available values are defined in IEEE Std 802.11u-2011, 7.3.1.34.
# Example values (group,type):
# 0,0 = Unspecified
# 1,7 = Convention Center
# 1,13 = Coffee Shop
# 2,0 = Unspecified Business
# 7,1 Private Residence
#venue_group=7
#venue_type=1

# Homogeneous ESS identifier (optional; dot11HESSID)
# If set, this shall be identical to one of the BSSIDs in the homogeneous
# ESS and this shall be set to the same value across all BSSs in homogeneous
# ESS.
#hessid=02:03:04:05:06:07

# Roaming Consortium List
# Arbitrary number of Roaming Consortium OIs can be configured with each line
# adding a new OI to the list. The first three entries are available through
# Beacon and Probe Response frames. Any additional entry will be available only
# through ANQP queries. Each OI is between 3 and 15 octets and is configured a
# a hexstring.
#roaming_consortium=021122
#roaming_consortium=2233445566

##### Multiple BSSID support #####
#
# Above configuration is using the default interface (wlan#, or multi-SSID VLAN
# interfaces). Other BSSIDs can be added by using separator 'bss' with
# default interface name to be allocated for the data packets of the new BSS.
#
# hostapd will generate BSSID mask based on the BSSIDs that are
# configured. hostapd will verify that dev_addr & MASK == dev_addr. If this is
# not the case, the MAC address of the radio must be changed before starting
# hostapd (ifconfig wlan0 hw ether <MAC addr>). If a BSSID is configured for
# every secondary BSS, this limitation is not applied at hostapd and other
# masks may be used if the driver supports them (e.g., swap the locally
# administered bit)
#
# BSSIDs are assigned in order to each BSS, unless an explicit BSSID is
# specified using the 'bssid' parameter.
# If an explicit BSSID is specified, it must be chosen such that it:
# - results in a valid MASK that covers it and the dev_addr
# - is not the same as the MAC address of the radio
# - is not the same as any other explicitly specified BSSID
#
# Please note that hostapd uses some of the values configured for the first BSS

```

```
# as the defaults for the following BSSes. However, it is recommended that all
# BSSes include explicit configuration of all relevant configuration items.
#
#bss=wlan0_0
#ssid=test2
# most of the above items can be used here (apart from radio interface specific
# items, like channel)

#bss=wlan0_1
#bssid=00:13:10:95:fe:0b
# ...
```

5. Update the following parameters (if applicable) in the configuration file:

- interface
- ssid
- channel
- wpa\_passphrase

6. Create a new stanza in `/etc/network/interfaces`:

```
iface wlan-sccp inet manual
    hostapd /etc/hostapd/hostapd.sccp.conf
```

7. Up the interface:

```
ifup wlan0=wlan-sccp
```

8. Configure your 7920/7921 to connect to the network.

To unlock the phone's configuration menu on the 7921:

- Press the Navigation Button downwards to enter SETTINGS mode
- Navigate to and select Network Profiles
- Unlock the IP phone's configuration menu by pressing `***#`. The padlock icon on the top-right of the screen will change from closed to open.

When asked for the authentication mode, select something like "Auto" or "AKM".

You don't have to enter anything for the username/password.

9. You'll probably want to bridge your wlan0 interface with another interface, for example a VLAN interface:

```
brctl addbr br0
brctl addif br0 wlan0
brctl addif br0 eth0.341
ip link set br0 up
```

10. If you are using virtualbox and your guest interface is bridged to eth0.341, you'll need to change its configuration and bridge it with br0 instead, else it won't work properly.

## Adding Support for a New Phone

This section describes the requirements to consider that a SCCP phone is working with XiVO libsccp.

### Basic functionality

- Register on Asterisk
- SCCP reset [restart]

- Call history
- Date time display
- HA

## Telephony

These test should be done with and without direct media enabled

- Emit a call
- Receive a call
- Receive and transfer a call
- Emit a call and transfer the call
- Hold and resume a call
- Features (\*0 and others)
- Receive 2 calls simultaneously
- Emit 2 calls simultaneously
- DTMF on an external IVR

## Function keys

- Redial
- DND
- Hold
- Resume
- New call
- End call
- Call forward (Enable)
- Call forward (Disable)
- Try each button in each mode (on hook, in progress, etc)

## Optional options to test and document

- Phone book
- Caller ID and other display i18n
- MWI
- Speeddial/BLF

## 1.12.16 Web Interface

### Configuration for development

Default error level for XiVO web interface is `E_ALL` & `~E_DEPRECATED` & `~E_USER_DEPRECATED` & `~E_RECOVERABLE_ERROR` & `~E_STRICT`

If you want to display warning or other error in your browser, edit the `/etc/xivo/web-interface/xivo.ini` and replace `report_type` level to 3:

```
[error]
level = 2047
report_type = 3
report_mode = 1
report_func = 1
email = john.doe@example.com
file = /var/log/xivo-web-interface/error.log
```

You may also edit `/etc/xivo/web-interface/php.ini` and change the error level, but you will need to restart the cgi:

```
/etc/init.d/spawn-fcgi restart
```

## Interactive debugging in Eclipse

Instructions for Eclipse 4.3.

On your XiVO:

1. Install `php5-xdebug`:

```
apt-get install php5-xdebug
```

2. Edit the `/etc/php5/conf.d/20-xdebug.ini` and add these lines at the end:

```
xdebug.remote_enable=1
xdebug.remote_host="<dev_host_ip>"
```

where `<dev_host_ip>` is the IP address of your machine where Eclipse is installed.

3. Restart `spawn-fcgi`:

```
service spawn-fcgi restart
```

On your machine where Eclipse is installed:

1. Make sure you have Eclipse PDT installed
2. Create a PHP project named `xivo-web-interface`:
  - Choose “Create project at existing location”, using the `xivo-web-interface/src` directory
3. In the Window / Preferences menu, on the PHP / Debug page:
  - Set the PHP Debugger to XDebug
  - Add a new PHP server with the following information:
    - Name: anything you want
    - Base URL: `https://<xivo_ip>`
    - Path Mapping:
      - \* Path on Server: `/usr/share/xivo-web-interface`
      - \* Path in Workspace: `/xivo-web-interface`
4. Create a new PHP Web Application debug configuration:
  - Choose the PHP server you created in last step
  - Pick some file, which can be anything if you don’t “break at first line”
  - Uncheck “Auto Generate”, and set the path you want your browser to open when you’ll launch this debug configuration.

Then, to start a debugging session, set some breakpoints in the code and launch your debug configuration. This will open the page in your browser, and when the code will hit your breakpoints, you'll be able to go through the code step by step, etc.

## 1.12.17 XiVO Client

### Building the XiVO Client

#### Building the XiVO Client on Windows platforms

This page explains how to build an executable of the XiVO Client from its sources for Windows.

#### Windows Prerequisites

**Cygwin** [Cygwin Web site](#)

Click the “setup” link and execute.

During the installer, check the package:

- Devel > git

**Qt SDK** You need the development files of the Qt 5 library, available on the [Qt website](#). The currently supported Qt version is 5.4.1.

**NSIS (installer only)** You will only need NSIS installed if you want to create an installer for the XiVO Client.

[NSIS download page](#)

During the installer, choose the full installation.

The XiVO Client NSIS script file uses the NSIS Application Association Registration Plug-in. Download and extract the plug-in and place the DLL from /Plugins in the NSIS/Plugins folder.

[NSIS Application Association Registration Plug-in download page](#)

**Get sources** In a **Cygwin shell**:

```
git clone git://github.com/xivo-pbx/xivo-client-qt.git
cd xivo-client-qt
```

#### Building

**Path configuration** You must change the values in `C:\Cygwin\home\user\xivo-client-qt\build-deps` to match the paths of your installed programs. You must use an editor capable of understanding Unix end of lines, such as [Notepad++](#).

Replace `C:\` with `/cygdrive/c` and backslashes (`\`) with slashes (`/`). You must respect the case of the directory names. Paths containing spaces must be enclosed in double quotes (`"`).

For example, if you installed NSIS in `C:\Program Files (x86)\nsis`, you should write:

```
WIN_NSIS_PATH="/cygdrive/c/Program files (x86)/nsis"
```

### Build In a Cygwin shell:

```
source build-deps
export PATH=$WIN_QT_PATH/bin:$WIN_MINGW_PATH/bin:$PATH

qmake
mingw32-make
```

Binaries are available in the `bin` directory.

The version of the executable is taken from the `git describe` command.

### Launch You can launch the built executable with:

```
source build_deps
PATH=$WIN_QT_PATH/bin:$PATH bin/xivoclient
```

### Package To create the installer:

```
mingw32-make pack
```

This will result in a `.exe` file in the current directory.

### Build options To add a console:

```
qmake CONFIG+=console
```

To generate debug symbols:

```
mingw32-make DEBUG=yes
```

### Clean

```
mingw32-make distclean
```

## Building the XiVO Client on GNU/Linux platforms

This page explains how to build an executable of the XiVO Client from its sources for GNU/Linux.

### Prerequisites

- Qt5 library development files: [Qt website](#) (Ubuntu packages `qt5-default` `qt5-qmake` `qttools5-dev-tools` `qttools5-dev`). The currently supported Qt version is 5.4.1.
- OpenGL development library - libGL (Debian package `libgl1-mesa-dev`)
- Git (Debian package `git`)
- Generic software building tools : `make`, `g++` ... (Debian package `build-essential`)

### Get sources In a bash shell:

```
$ git clone git://github.com/xivo-pbx/xivo-client-qt.git
```

**Building** You need to have the Qt5 binaries (`qmake`, `lrelease`, ...) in your `$PATH`.

Launch `qmake` to generate the Makefile:

```
$ cd xivo-client-qt
$ /path/to/qt5/bin/qmake
```

This will also generate a file `versions.mak` that contains version informations about the code being compiled. It is necessary for compilation and packaging.

You can then launch `make`:

```
$ make
```

Binaries are available in the `bin` directory.

The version of the executable is taken from the `git describe` command.

**Build options** To generate debug symbols:

```
$ make DEBUG=yes
```

To compile the unit tests of the XiVO Client:

```
$ qmake CONFIG+=tests
```

or, if you have a recent version of Google Mock (e.g. on Debian Wheezy):

```
$ qmake CONFIG+=tests CONFIG+=gmock
```

To compile the XiVO Client ready for functional tests:

```
$ make FUNCTESTS=yes
```

## Cleaning

```
$ make distclean
```

**Launch** You can launch the built executable with:

```
$ LD_LIBRARY_PATH=bin bin/xivoclient
```

**Package** To create the Debian package, usable on Debian and Ubuntu, you first need to modify `build-deps` to locate the Qt 5 installation directory:

```
$ /path/to/qt5/bin/qmake -spec linux-g++
$ make
$ make pack
```

This will result in a `.deb` file in the current directory.

The version of the package is taken from the `git describe` command.

## Building the XiVO Client on Mac OS

This page explains how to build an executable of the XiVO Client from its sources for Mac OS.

### Mac OS Prerequisites

**Developer tools** You will need an Apple developer account to get development tools, such as GCC. To log in or sign in, go to the [Developer portal of Apple](#). In the Downloads section, get the Command line Tools for XCode and install them. You might want to get XCode too, but it is rather big.

**Qt SDK** You need the development files of the Qt 5 library, available on the [Qt website](#). The currently supported Qt version is 5.4.1.

**Get sources** In a bash shell, enter:

```
$ git clone git://github.com/xivo-pbx/xivo-client-qt.git
```

**Building** Launch qmake to generate the Makefile:

```
$ cd xivo-client-qt
$ /path/to/qt5/bin/qmake -spec macx-g++
```

This will also generate a file `versions.mak` that contains version informations about the code being compiled. It is necessary for compilation and packaging.

You can then launch make:

```
$ make
```

Binaries are available in the `bin` directory.

The version of the executable is taken from the `git describe` command.

**Debug build** Add `DEBUG=yes` on the command line:

```
$ make DEBUG=yes
```

**Cleaning**

```
$ make distclean
```

**Launch** You can launch the built executable with:

```
$ DYLD_LIBRARY_PATH=bin bin/xivoclient.app/Contents/MacOS/xivoclient
```

**Package** You need to have the bin directory of Qt in your `$PATH`.

To create the app bundle:

```
$ make pack
```

This will result in a `.dmg` file in the current directory.

The version of the package is taken from the `git describe` command.

**Building old versions**

**Building old versions**

**1.1.23 - Gallifrey**

## Build

- Download [this patch](#)
- git checkout xivo-client-1.1.23
- git apply xivoclient-1.1.23.patch
- Edit Makefile and set the variable QMAKE to the path of your qmake
- make all

## Package (macos)

- Edit cross/macos-pack.sh and set QT\_PATH
- ./cross/macos-pack.sh

## 1.0.15 - Dalek

### Build (windows)

- Download [this patch](#)
- Edit the patch and set the paths to Qt, NSIS, etc.
- (cygwin) git checkout xivo-client-1.0.15
- (cygwin) make all-win32
- (qt cmd) mingw32-make win32-baselib
- (qt cmd) mingw32-make win32-xivoclient
- (qt cmd) mingw32-make win32-plugins

### Package (windows)

- (cygwin) make win32packdyn-xivoclient

## Coding the XiVO Client

### Project folder map

**baselib** The folder *baselib* contains all files necessary to build the baselib. It contains the necessary code and data structures to communicate with the XiVO CTI server.

This library is designed to be reusable by other XiVO CTI clients. If you want to build it without the rest of the XiVO Client, go in its folder and type:

```
$ qmake && make
```

The library will be available in the new bin folder.

**xivoclient** The folder *xivoclient* contains all other source files included in the XiVO Client.

*src* contains the source code files, *images* contains the images, *i18n* contains the translation files and *qtaddons* contains some Qt addons used by the XiVO Client.

**src** The source files are separated in three categories :

- the XiVO Client itself, the source files are directly in *src*.
- the XLet library (*xletlib*) contains the code common to multiple XLets (plugins), like the XLet base class and mainly GUI stuff.
- the XLets themselves (*xlets*), each one is in a *xlets/something* subfolder.

Each XLet is compiled into a dynamic library, but some XLets are still compiled within the xivoclient executable instead of in a separated library. They are marked with a *\*-builtin* subfolder name.

**delivery** This folder contains all license informations necessary for the XiVO Client to be redistributed, i.e. the GNU GPLv3 and the additional requirements.

### Configuration access

The settings of the application are stored in BaseEngine for runtime and in files when the client is closed :

- *~/.config/XiVO* on GNU/Linux systems
- (what about other platforms?)

There are now 3 sets of functions from BaseEngine that you can use to read/store settings :

**getConfig() / setConfig()** They are proxy methods to use the BaseConfig object inside BaseEngine. They use QVariantMap to store the settings values. They are currently used to store/retrieve options used in the ConfigWidget.

**You can find the available keys to access data in the detailed Doxygen documentation of BaseEngine,** or in *baseengine.h*.

Note that the settings stored in BaseConfig won't be written in the configuration file if BaseEngine is not aware of their existence (loaded in *loadSettings* and saved in *saveSettings*).

**getSettings()** Through this function, you can access the lowest level of configuration storage, QSettings. It also contains the options stored in BaseConfig, but is less easy to use.

This direct access is used for purely graphical settings, only used to remember the appearance of the GUI until the next launch. These settings don't have to be shared with other widgets, and storing them directly in QSettings avoids writing code to import/export to/from BaseConfig.

**getProfileSetting() / setProfileSetting()** This pair of methods allow you to read/write settings directly in QSettings, but specifically for the current configuration profile.

### Configuration profiles

When starting XiVO Client with an argument, this argument is interpreted as a profile name. This profile name allows you to separate different profiles, with different configuration options.

For example, configuration profile "profileA" will auto-connect with user A and password B and "profileB" will not auto-connect, but is set to connect with user C, no password remembered. To invoke these profiles, use :

```
$ xivoclient profileA
$ xivoclient profileB
```

The default configuration profile is default-user.

## Recognizing / extracting phone numbers

Of course, working on XiVO Client implies working with phone numbers. But how to interpret them easily, when we are not sure of the format they're in?

You can use the `PhoneNumber` namespace (*baselib/src/phonenumbers.h*) to do that, it contains routines for recognition/extraction of phone numbers, that way you don't have to parse manually.

These subroutines are pretty basic for the moment, if you need/want to improve them, feel free to do it.

## Retrieving CTI server infos

Informations are synchronized from the server to the BaseEngine when the client connects.

It is stored in BaseEngine in "lists". It is stored in a format close to the one used to transmit it, so you can see the CTI protocol definition for further documentation.

Each list contains objects of different type. These types are :

- channel
- user
- phone
- trunk
- agent
- queue
- group
- meetme
- voicemail
- queuemember
- parking

Each type corresponds to a class derived from `XInfo`, e.g. channel infos are stored in `ChannelInfo` objects.

The basic attributes of all objects are 3 strings: the IPBX ID, the XiVO object ID and the extended ID of the object, which is the two previous attributes linked with a "/".

**Listen to IPBX events** If you want your XLet to receive IPBX/CTI events, you can do so by inheriting the `IPBXListener` interface.

You must specify which type of events you want to listen. This depends of the implemented functions in the CTI server. You can register to listen these events by calling the `IPBXListener` method :

```
registerListener(XXX);
```

For now, `XXX`, the event type, can take the values : \* chitchat \* history \* records\_campaign \* queuestats

On reception of the specified type of event, BaseEngine will call the `IPBXListener` method `parseCommand(QVariantMap)`.

You should then reimplement this method to make it process the event data, stored in the `QVariantMap` parameter.

## The parking XLet

There are two concepts here : \* Parked calls: These calls have been parked by a switchboard or an operator. They are waiting to be answered by a specific person, unlike a queue, where calls will be answered by one of the agents

of the group associated to the queue. Each parked call is given a phone number so that the call can be answered by everyone.

- **Parking lots:** They are containers for parked calls. Each parking lot has a phone number, used to identify where to send the call we want to park.

ParkingWidget represents a parking lot and contains a table that stores all parked calls.

### Adding new XLets

When you want to add a new XLet, you can use the basic XLetNull, that only prints “Hello World”. Here is a little script to accelerate the copy from XLetNull.

```
#!/usr/bin/env sh

newname="newname" # Replaces xletnull
NewName="NewName" # Replaces XLetNull & XletNull
NEWNAME="NEWNAME" # Replaces XLETNULL

if [ ! -d xletnull ] ; then

    echo "Please execute this script in XIVO_CLIENT/plugins"
    echo $newname
    exit 1
fi

cp -r xletnull $newname
cd $newname
rm -f moc* *.o Makefile

for f in $(find . -type f -print) ; do
    mv $f `echo $f | sed s/xletnull/$newname/`
done

find . -type f -exec sed -i "s/xletnull/$newname/g;s/X[Ll]etNull/$NewName/g;s/XLETNULL/$NEWNAME/g"
```

Before executing the script, just replace the first three variables with the name of the new XLet.

Then, you must add a line in xivoclient/xlets.pro to add your new directory to the SUBDIRS variable.

Then you can start implementing your new class. The <xletname>Plugin class is only an interface between the main app and your XLet.

**Translations** If you want to localize your XLet, there are four steps.

**Modify the sources** In the <xletname>Plugin constructor, add the line :

```
b_engine->registerTranslation("/:<xletname>_%1");
```

before the return instruction.

**Modify the project file** Add these lines in the .pro file in your XLet directory :

```
TRANSLATIONS = <xletname>_fr.ts TRANSLATIONS += <xletname>_nl.ts
RESOURCES = res.qrc
```

Replace fr and nl with the languages you want.

**Create the resource file** In a file `res.qrc` in your XLet directory, put these lines :

```
<!DOCTYPE RCC><RCC version="1.0">
  <qresource>
    <file><xletname>_fr.qm</file>
    <file><xletname>_nl.qm</file>
  </qresource>
</RCC>
```

These files will be embedded in the Xlet library binary.

**Create the translation files** In your XLet directory, run :

```
lupdate <xletname>.pro
```

This creates as much `.ts` translation files as specified in the `.pro` file. You can now translate strings in these file.

The XLet will now be compiled and translated.

### Add a new XLet

For now, it is not possible to add easily an XLet without changing the CTI server configuration files.

If you just want to test your new XLet, you can add the following line in `baseengine.cpp` :

```
m_capaxlets.push_back(QVariantList() << QVariant("<xletname>") << QVariant("tab"));
```

right after the line

```
m_capaxlets = datamap.value("capaxlets").toList();
```

You can replace `"tab"` with `"grid"` or `"dock"`.

### Add a translation

This is definitely not something funny and not easy to automatize.

You have to add, in every `.pro` file of the project (except `xlets.pro` and all those that don't need translations), a line

```
TRANSLATIONS += <project>_<lang>.ts
```

Replace `<project>` with the project name (`xivoclient`, `baselib`, `xlet`) and `<lang>` by the identifier of your language (`en`, `fr`, `nl`, ...) Then you have to add, in every `.qrc` file, the `.qm` files corresponding to the ones you added in the `.pro` files, such as :

```
<file><project>_<lang>.qm</file>
```

in the `<qresource>` section of these XML `.qrc` files.

After that, you have to run, in the XiVO Client root directory, something like :

```
find . -name *.pro -exec lupdate { } ;
```

This will create or update all `.ts` translation files registered in the `.pro` files.

You can then start translating the strings in these files, in the `xivoclient/i18n` folder.

### Code modification

If you want to be able to select your new language from within the XiVO Client, you have to add it in the interface.

For that, you can add your new language in the `m_locale_cbox` `QCombobox` in `ConfigWidget`.

## CTI debugging tool

If you have a problem and you want to see what is going on between the CTI server and client, you can use a specific script, designed specifically for XiVO, instead of using something like Wireshark to listen network communications.

## Profiling

To get profiling informations on the XiVO Client:

- Compile the XiVO Client with debugging symbols
- Run the command:

```
LD_LIBRARY_PATH=bin valgrind --tool=callgrind bin/xivoclient
```

- Quit the client
- Open the generated file `callgrind.out.<pid>` with KCacheGrind

## Automatic checking tools

We use two tools to check the source code of the XiVO Client: CppCheck et Valgrind.

**CppCheck** Usage:

```
cppcheck -I baselib/src -I xivoclient/src .
```

**Valgrind (Memcheck)** Usage:

```
LD_LIBRARY_PATH=bin valgrind --leak-check=full --suppressions=valgrind.supp --num-callers=30 --ge
```

You need to fill a file `valgrind.supp` with Valgrind suppressions, to avoid displaying errors in code you have no control over.

Here is a template `valgrind.supp` you can use. All memory in the XiVO Client is allocated using the new operator, so all calls to `malloc` and co. must come from libraries:

```
{
    malloc
    Memcheck:Leak
    fun:malloc
    ...
}

{
    calloc
    Memcheck:Leak
    fun:calloc
    ...
}

{
    realloc
    Memcheck:Leak
    fun:realloc
    ...
}

{
```

```

memalign
Memcheck:Leak
fun:memalign
...
}

```

## Figures

Here's a call graph for the presence features. Not complete, but gives a good global view of the internal mechanism.

Fig. 1.99: Xivo Client presence call graph

Here's a call graph describing the chaining of calls when the XiVO Client connects to the server.

Fig. 1.100: Xivo Client login call graph

## Manage Translations of the XiVO Client

This sections describes how to manage XiVO Client translations from a developer point of view. If you want to help translate the XiVO Client, see [Translating XiVO](#)

You need to install these tools:

```

pip install transifex-client
apt-get install qt4-dev-tools

```

## How to Add a New Translated String

String to be translated is marked using the `tr` macro in the source code.

Example:

```
tr("Number");
```

**Updating translations on transifex** Run the following commands from the root of the `xivo-client-qt` project:

```
make pushttr
```

After this command, you can visit [Transifex](#), and check that the `xivo-client` is 100% translated for your language. Once all the translations have been checked, run the 3 following commands:

```
make pulltr
git commit
git push
```

**Warning:** Under Arch Linux, you must have `qt5` installed and prepend `QT_PATH=/usr/bin` before `make {pull,push}tr`.

## Add a new XiVO Client locale

Localizing the XiVO Client goes through four steps :

- Creating the new translation in Transifex
- Generating the translation files
- Embedding the translation in the binaries
- Displaying the new locale to be chosen

**Creating the new translation in Transifex** Log into Transifex and click the `Create language` option.

**Generate translation files** The translation files will be automatically generated from the source code.

For the command to create files for your locale, you need to ensure it is listed in the project file.

There are a few project files you should edit, each one will translate a module of the XiVO Client :

- `baselib/baselib.pro`
- `xivoclient/xivoclient.pro`
- `xivoclient/xletlib.pro`
- `xivoclient/src/xlets/*/*.pro`

In these files, you should add a line like this one:

```
TRANSLATIONS += $$ROOT_DIR/i18n/xivoclient_fr.ts
```

This line adds a translation file for french. Please replace `fr` by the code of your locale. The `$$ROOT_DIR` variable references either `xivoclient` or `baselib`.

You can use a command like the following to automate this (`$LANG` is the new language):

```
find . -name '*.pro' -exec sed -i -e 's|^TRANSLATIONS += ${\?ROOT_DIR}\?/i18n/\(.*\)_en.ts|\0\nT
```

To actually create the files, you will have to use the translation managing script. But first, you must tell the script about your new locale. Edit the `utils/translations.sh` file and add your locale to the `LOCALES` variable. Then, you can run the script:

```
$ make pulltr
```

**Embed the translation files** For each project previously edited, you should have a corresponding `.qrc` file. These resource files list all files that will be embedded in the XiVO Client binaries. You should then add the corresponding translation files like below:

```
<file>obj/xivoclient_fr.qm</file>
```

This embeds the French translation of the `xivoclient` module, corresponding to the translation file above. The path is changed to `obj/` because the `.qm` file will be generated from the `.ts` file.

You can use a command like the following to automate this (`$LANG` is the new language):

```
find . -name '*.qrc' -exec sed -i -e 's|^(\s*)<file>\(.*\)obj/\(.*\)_fr.qm</file>|\0\n\1<file>\2
```

**Display the new locale** You have to edit the source file `xivoclient/src/configwidget.cpp` and add the entry corresponding to your locale in the locale-choosing combobox.

## 1.13 Quality assurance

### 1.13.1 Testing architecture at Avencall

Fig. 1.101: Testing architecture at Avencall

Legend:

- assu is our production XiVO, used to make calls in the company. We also use it as a source of “external” calls to the test servers.
- dev-gateway is a simple gateway, to link all other servers.
- xivo-daily is reinstalled every day and runs all the automatic tests in [xivo-acceptance](#).
- xivo-load handles a lot of calls all day long, and we monitor the system metrics while it does.
- callgen makes the calls towards xivo-load
- xivo-test and xivo-test-slave are used for manual tests we run before each release
- xivo-premium (not yet installed) will allow us to test the new xivo-premium hardware

## 1.14 Troubleshooting

The list of current bugs can be found on [the official XiVO issue tracker](#).

### 1.14.1 Transfers using DTMF

When transferring a call using DTMF (\*1) you get an *invalid extension* error when dialing the extension.

The workaround to this problem is to create a preprocess subroutine and assign it to the destinations where you have the problem.

Under *Services* → *IPBX* → *IPBX configuration* → *Configuration files* add a new file containing the following dialplan:

```
[allow-transfer]
exten = s,1,NoOp(## Setting transfer context ##)
same = n,Set(__TRANSFER_CONTEXT=<internal-context>)
same = n,Return()
```

Do not forget to substitute <internal-context> with your internal context.

Some places where you might want to add this preprocess subroutine is on queues and outgoing calls to be able to transfer the called person to another extension.

### 1.14.2 Fax detection

XiVO **does not currently support Fax detection**. The following describe a workaround to use this feature. The behavior is to answer all incoming (external) call, wait for a number of seconds (4 in this example) : if a fax is detected, receive it otherwise route the call normally.

---

**Note:** This workaround works only :

- on incoming calls towards an User (and an User only),
- if the incoming trunk is a DAHDI or a SIP trunk,
- if the user has a voicemail which is activated and with the email field filled
- XiVO >= 13.08 (needs asterisk 11)

Be aware that this workaround will probably not survive any upgrade.

---

1. In the Web Interface and under *Services* → *IPBX* → *IPBX configuration* → *Configuration files* add a new file named *fax-detection.conf* containing the following dialplan:

```
;; Fax Detection
[pre-user-global-faxdetection]
exten = s,1,NoOp(Answer call to be able to detect fax if call is external AND user has an email)
same = n,GotoIf("${XIVO_CALLORIGIN}" = "extern"?:return)
same = n,GotoIf("${XIVO_USEREMAIL}?:return)
same = n,Set(FAXOPT(faxdetect)=yes) ; Activate dynamically fax detection
same = n,Answer()
same = n,Wait(4) ; You can change the number of seconds it will wait for fax (4 to 6 is good)
same = n,Set(FAXOPT(faxdetect)=no) ; If no fax was detected deactivate dynamically fax detection
same = n(return),Return()

exten = fax,1,NoOp(Fax detected from ${CALLERID(num)} towards ${XIVO_DSTNUM} - will be sent via fax)
same = n,GotoIf("${CHANNEL(channeltype)}" = "DAHDI"?changeechocan:continue)
same = n(changeechocan),Set(CHANNEL(echocan_mode)=fax) ; if chan type is dahdi set echo mode to fax
same = n(continue),Gosub(faxtomail,s,1("${XIVO_USEREMAIL}))
```

2. In the file `/etc/xivo/asterisk/xivo_globals.conf` set the global user subroutine to `pre-user-global-faxdetection`: this subroutine will be executed each time a user is called:

```
XIVO_PRESUBR_GLOBAL_USER = pre-user-global-faxdetection
```

3. Reload asterisk configuration (both for dialplan and dahdi):

```
asterisk -rx 'core reload'
```

### 1.14.3 Berofos Integration with PBX

You can use a Berofos failover switch to secure the ISDN provider lines when installing a XiVO in front of an existing PBX. The goal of this configuration is to mitigate the consequences of an outage of the XiVO : with this equipment the ISDN provider links could be switched to the PBX directly if the XiVO goes down.

**XiVO does not offer natively** the possibility to configure Berofos in this failover mode. This section describes a workaround.

Logical view:

Connection:

The following describes how to configure your XiVO and your Berofos.

1. Follow the Berofos general configuration (firmware, IP, login/password) described in the the [Berofos Installation and Configuration](#) page.
2. When done, apply these specific parameters to the berofos:

```
bnfos --set scenario=1 -h 10.105.2.26 -u admin:berofos
bnfos --set mode=1 -h 10.105.2.26 -u admin:berofos
bnfos --set modedef=1 -h 10.105.2.26 -u admin:berofos
bnfos --set wdog=1 -h 10.105.2.26 -u admin:berofos
bnfos --set wdogdef=1 -h 10.105.2.26 -u admin:berofos
bnfos --set wdogitime=60 -h 10.105.2.26 -u admin:berofos
```

### 3. Add the following script /usr/local/sbin/berofos-workaround:

```
#!/bin/bash
# Script workaround for berofos integration with a XiVO in front of PABX

res=$(/etc/init.d/asterisk status)
does_ast_run=$?
if [ $does_ast_run -eq 0 ]; then
    /usr/bin/logger "$0 - Asterisk is running"
    # If asterisk is running, we (re)enable wdog and (re)set the mode
    /usr/bin/bnfos --set mode=1 -f fos1 -s
    /usr/bin/bnfos --set modedef=1 -f fos1 -s
    /usr/bin/bnfos --set wdog=1 -f fos1 -s

    # Now 'kick' berofos ten times each 5 seconds
    for ((i == 1; i <= 10; i += 1)); do
        /usr/bin/bnfos --kick -f fos1 -s
        /bin/sleep 5
    done
else
    /usr/bin/logger "$0 - Asterisk is not running"
fi
```

### 4. Add execution rights to script:

```
chmod +x /usr/local/sbin/berofos-workaround
```

### 5. Create a cron to launch the script every minutes /etc/cron.d/berofos-cron-workaround:

```
# Workaround to berofos integration
MAILTO=""

*/1 * * * * root /usr/local/sbin/berofos-workaround
```

## 1.14.4 Upgrading from XiVO 1.2.3

### 1. There is an issue with xivo-libsccp and pf-xivo-base-config during an upgrade from 1.2.3:

```
dpkg: error processing /var/cache/apt/archives/pf-xivo-base-config_13%3a1.2.4-1_all.deb (--un
trying to overwrite '/etc/asterisk/sccp.conf', which is also in package xivo-libsccp 1.2.3.1-
...
Errors were encountered while processing:
/var/cache/apt/archives/pf-xivo-base-config_13%3a1.2.4-1_all.deb
E: Sub-process /usr/bin/dpkg returned an error code (1)
```

### 2. You have to remove /var/lib/dpkg/info/xivo-libsccp.conf files:

```
rm /var/lib/dpkg/info/xivo-libsccp.conf files
```

### 3. You have to edit /var/lib/dpkg/info/xivo-libsccp.list and remove the following line:

```
/etc/asterisk/sccp.conf
```

### 4. and remove /etc/asterisk/sccp.conf:

```
rm /etc/asterisk/sccp.conf
```

5. Now, you can launch `xivo-upgrade` to finish the upgrade process

### 1.14.5 CTI server is frozen and won't come back online

You must ensure that the partition containing `/var` always has at least 100 MiB of free disk space. If it does not, the symptoms are:

- the CTI server is frozen after logging/unlogging an agent or adding/removing a member from a queue.
- trying to log/unlog an agent via a phone is not possible

To get the system back on tracks after freeing some space in `/var`, you must do:

```
xivo-service restart
```

### 1.14.6 CTI server is unexpectedly terminating

If you observe that your CTI server is sometimes unexpectedly terminating with the following message in `/var/log/xivo-ctid.log`:

```
(WARNING) (main): AMI: CLOSING
```

Then you might be in the case where asterisk generates lots of data in a short period of time on the AMI while the CTI server is busy processing other thing and is not actively reading from its AMI connection. If the CTI server takes too much time before consuming some data from the AMI connection, asterisk will close the AMI connection. The CTI server will terminate itself once it detects the connection to the AMI has been lost.

There's a workaround to this problem called the `ami-proxy`, which is a process which buffers the AMI connection between the CTI server and asterisk. This should only be used as a last resort solution, since this increases the latency between the processes and does not fix the root issue.

---

**Note:** New in version 14.21

---

To enable the `ami-proxy`, you must:

1. Edit the file `/etc/default/xivo-ctid` and add the following line:

```
export XIVO_CTID_AMI_PROXY=1
```

2. Restart the CTI server:

```
service xivo-ctid restart
```

If you are on a XiVO cluster, you must do the same procedure on the slave if you want the `ami-proxy` to also be enabled on the slave.

To disable the `ami-proxy`, make sure the line you added in step 1 is completely removed (it is not sufficient to set the value of the variable to 0). You can remove the `/etc/default/xivo-ctid` file if it is now empty.

### 1.14.7 Agents receiving two ACD calls

An agent can sometimes receive more than 1 ACD call at the same time, even if the queues he's in have the "ringinuse" parameter set to no (default).

This behaviour is caused by a bug in asterisk: <https://issues.asterisk.org/jira/browse/ASTERISK-16115>

It's possible to workaround this bug in XiVO by adding an agent *subroutine*. The subroutine can be either set globally or per agent:

```

[pre-limit-agentcallback]
exten = s,1,NoOp()
same  = n,Set(LOCKED=${LOCK(agentcallback)})
same  = n,GotoIf(${LOCKED}?not-locked,1)
same  = n,Set(GROUP(agentcallback)=${XIVO_AGENT_ID})
same  = n,Set(COUNT=${GROUP_COUNT(${XIVO_AGENT_ID}@agentcallback)})
same  = n,NoOp(${UNLOCK(agentcallback)})
same  = n,GotoIf(${COUNT} <= 1]?too-many-calls,1)
same  = n,Return()

exten = not-locked,1,NoOp()
same  = n,Log(ERROR,Could not obtain lock)
same  = n,Wait(0.5)
same  = n,Hangup()

exten = too-many-calls,1,NoOp()
same  = n,Log(WARNING,Not calling agent ID/${XIVO_AGENT_ID} because already in use)
same  = n,Wait(0.5)
same  = n,Hangup()

```

This workaround only applies to queues with agent members; it won't work for queues with user members.

Also, the subroutine prevent asterisk from calling an agent twice by hangingup the second call. In the agent statistics, this will be shown as a non-answered call by the agent.

## 1.15 Community Documentation

This page provides links to resources on various topics around XiVO. They have been generously created by people from the community.

### 1.15.1 Tutorials

Please note that these resources are provided on an “as is basis”. They have not been reviewed by the XiVO team, therefore the information presented may be inaccurate. We also accept resources provided in other languages besides English.

Unless specified, the license is [CC BY-SA](#).

Tutorial	Language	XiVO Version	Author
How to popup an url with CTIClient	French	14.17	Assonance
<a href="#">Xivo pour les nuls</a>	French		
How to use openVPN on XiVO	French		Yohan Vitu
How to backup XiVO to external FTP with backup-ftp.sh	French		Yohan Vitu
How to create a XiVO Client	French		Yohan Vitu
How to configure a C610P IP on XiVO	French		Yohan Vitu
How to export the phonebook of XiVO with <a href="#">phonebook_csv_export.py</a>	French		Yohan Vitu
Installing XiVO (YouTube series)	English	14.20	VoIP-Nuiz
