Important: What's new in this version ?

- XiVO administration web interface has been revamped to make it lighter and more responsive.
- UC assistant can handle conferences with features such as showing participants, including a visual indicator to show who is talking. Added also possibility to Mute/Unmute/Kick participants if you're an organizer of the conference.
- Personal contacts can be managed now from UC assistant. Possibility to add/edit/delete/import your own contacts from the application.

Note: For previous LTS version, see XiVO Polaris documentation.

XiVO solutions developed by Avencall is a suite of PBX applications based on several free existing components including Asterisk and our own developments. This powerful and scalable solution offers a set of features for corporate telephony and call centers to power their business.

You may also have a look at our development blog for technical news about the solution

CHAPTER 1

Introduction

XiVO solutions is a suite of PBX applications developed by Avencall, based on several free existing components including Asterisk Play Akka and Scala. It provides a solution for enterprises who wish use modern communication services (IPBX, Unified Messaging, ...) api and application to businesses.

It gives especially access to outsourced statistics, real-time supervision screens, third-party CTI integration and recording facilities.

XiVO solutions is free software. Most of its distinctive components, and XiVO solutions as a whole, are distributed under the *GPLv3 license* and or the *LGPLv3 license*.

XiVO solutions documentation is also available as a downloadable HTML, EPUB or PDF file. See the downloads page for a list of available files or use the menu on the lower right.

1.1 XiVO History

XiVO was created in 2005 by Sylvain Boily (Proformatique SARL). The XiVO mark is now owned by Avencall SAS after a merge between Proformatique SARL and Avencall SARL in 2010. The XiVO core team now works for Avencall in Lyon (France) and Prague (Czech Republic)

- XiVO 1.2 was released on February 3, 2012.
- XiVO 13.07 was the last version with Asterisk 1.8.21.0
- XiVO 13.08 includes Asterisk 11.3.0 in May 2013
- XiVO 13.25 is running under Wheezy in December 2013
- XiVO 14.02 is now called XiVO Five to celebrate the editor 5th year
- XiVO 15.13 runs Asterisk 13 in July 2015
- XiVO 15.20 is running under Jessie in January 2016
- XiVO 2016.02 starts the new versioning system including XiVO-CC and XiVO-UC modules in October 2016
- XiVO solutions 2016.04 includes new XiVO assistant, web edition, mobile edition and Desktop edition in December 2016
- XiVO solutions 2017.03 in April 2017 is the first Long Term Support version known as Five
- XiVO solutions 2017.11 in October 2017 is the second Long Term Support release known as Polaris

In April 2017 the 3rd, Avencall released the fist Long Term Support release of XiVO.solution software suite. The main goal is to offer a stable version every 6 months even if the team is still doing small and agile iterations of 3 weeks. This release LTS 2017.03 will be the last XiVO Five.

In October 2017, Avencall released the second LTS release of XiVO.solutions software suite, Polaris: among other things, it includes major improvements in the CC Agent application.

Next release is on the way, will be called XiVO Aldebaran and will be available in April 2018.

CHAPTER 2

Getting Started

This section will show you how to create a user with a SIP line. This simple use case covers what a lot of people need to start using a phone. You can use these steps for configuring a phone (e.g a softphone, an Analog-to-Digital switch or a SIP phone).

This tutorial doesn't cover how to automatically provision a *supported device*. For this, consult the *provisionning section*.

We first need to log into the XiVO web interface. The web interface is where you can administer the whole system.

When logged in, you will see a page with all the status information about your system. This page helps you monitor the health of your system and gives you information about your network. Please note the IP address of your server, you will need this information later on when you will configure your device (e.g. phone)

To configure a device for a user, start by navigating to the IPBX menu. Hover over the *Services* tab, a dropdown menu will appear. Click on *IPBX*.

Select the Users setting in the left menu.

From here, press on the "plus" sign. A pop up will appear where you can click on Add.

We now have the form that will allow us to create a new user. The three most important fields are 'First name', 'Last name' and 'Language'. Fill in the fields and click on *Save* at the bottom. For our example, we will create a used called 'Alice Wonderland'.

Afterwards, click on the "Lines" tab.

Enter a number for your phone. If you click inside the field, you will see the range of numbers you can use. For our example, we will use '1000'.

By default, the selected protocol is SIP, which is what we want for now. Click on Save to create the line.

We now have a user named 'Alice Wonderland' with the phone number '1000'.

Now we need to go get the SIP username and password to configure our phone. Go back to the IPBX menu on the left, and click on 'Lines'.

You will see a line associated with the user we just created. Click on the pencil icon to edit the line.

We can now see the username and password for the SIP line. you can configure your phone using the IP for your server, the username and the password.

CHAPTER 3

Installation & Upgrade Guide

In-depth documentation on installation and deployment of XiVO solution systems.

3.1 XiVO Installation & Upgrade

3.1.1 Installing the System

Please refer to the section *Troubleshooting* if ever you have errors during the installation.

There are two official ways to install XiVO:

- using the official ISO image
- using a minimal Debian installation and the XiVO installation script

XiVO can be installed on both virtual (QEMU/KVM, VirtualBox, ...) and physical machines. That said, since Asterisk is sensitive to timing issues, you might get better results by installing XiVO on real hardware.

Installing from the ISO image

Note: Our ISO image does not support UEFI system

- Download the ISO image. (latest version) (all versions)
- Boot from the ISO image, select Install and follow the instructions. You must select a locale with charset UTF-8.
- At the end of the installation, you can continue by running the configuration wizard.

During the installation of Debian, only a proxy that supports proxying http/https requests may eventually be entered. Otherwise GPG key of XiVO repository will not be installed and must be added manually:

wget http://mirror.xivo.solutions/xivo_current.key -0 - | apt-key add -

Installing from a minimal Debian installation

XiVO can be installed directly over a **64-bit** Debian jessie. When doing so, you are strongly advised to start with a clean and minimal installation of Debian jessie.

The latest installation image for Debian jessie can be found at https://www.debian.org/releases/jessie/ debian-installer.

Requirements

The installed Debian must:

- use the architecture amd64
- have a default locale with charset UTF-8

Note: In case you want to migrate a XiVO from i386 to amd64, see *Migrate XiVO from i386 (32 bits) to amd64 (64 bits)*.

Installation

Once you have your Debian jessie properly installed, download the XiVO installation script and make it executable:

```
wget http://mirror.xivo.solutions/xivo_install.sh
chmod +x xivo_install.sh
```

And run it:

```
./xivo_install.sh
```

At the end of the installation, you can continue by running the configuration wizard.

Alternatives versions

The installation script can also be used to install an *archive version* of XiVO (14.18 or later only). For example, if you want to install XiVO 16.03:

./xivo_install.sh -a 16.03

When installing an archive version, note that:

- versions 14.18 to 15.19 of XiVO can only be installed on a Debian 7 (wheezy) system
- the 64-bit versions of XiVO are only available starting from 15.16

You may also install development versions of XiVO with this script. These versions may be unstable and should not be used on a production server. Please refer to the usage of the script:

./xivo_install.sh -h

Other installation methods

It's also possible to install XiVO by PXE. It is not documented here.

3.1.2 Running the Wizard

After the system installation, you must go through the wizard before being able to use your XiVO. Open your browser and enter your server's IP address in the navigation bar. (For example: http://192.168.1.10)

Language

You first have to select the language you want to use for the wizard.

| XiVO | | | |
|--|--|--|--|
| XIVO Installation | Welcome | | |
| Steps Welcome Licence Configuration | NEXT> | | |
| Entities and contexts Validation | Welcome into the XiVO installer. | | |
| | Thanks for choosing XiVO. This installer will help you to configure a fully functional XiVO. | | |
| | Let yourself be guided and don't forget to note informations you will set (i.e root password for XiVO administration interface login). | | |
| | You can also get online help at http://documentation.xivo.solutions. | | |
| | Have fun! | | |
| | Step 1: Choose your language >>> Language : English • | | |

License

You then have to accept the GPLv3 License under which XiVO is distributed.

Configuration

- 1. Enter the hostname (Allowed characters are : A-Z = a-z = 0-9 -)
- 2. Enter the domain name (Allowed characters are : $A-Z \quad a-z \quad 0-9 \quad .$)
- 3. Enter the password for the root user of the web interface,
- 4. Configure the IP address and gateway used by the VoIP interface
- 5. Modify the DNS server information if needed
- 6. And finally, choose (or not) to apply the default configuration for France (see: *Default configuration for France*).

Entities and Contexts

Contexts are used for managing various phone numbers that are used by your system.

- The Internal calls context manages extension numbers that can be reached internally
- The Incalls context manages calls coming from outside of your system
- The Outcalls context manages calls going from your system to the outside
- 1. Enter the entity name (e.g. your organization name) (Allowed characters are : A-Z a-z 0-9 .)
- 2. Enter the number interval for you internal context. The interval will define the users's phone numbers for your system (you can change it afterwards)
- 3. Enter the DID range and DID length for your system.

| | * Display name : | Outcalls | 4 |

Fig. 3.4: Entities and Contexts

4. You may change the name of your outgoing calls context.

Validation

Finally, you can validate your configuration by clicking on the Validate button. Note that if you want to change one of the settings you can go backwards in the wizard by clicking on the Previous button.

Warning: This is the last time the root password will be displayed. Take care to note it.

Congratulations, you now have a fully functional XiVO server.

To start configuring XiVO, see Getting Started.

3.1.3 Default configuration for France

Note: This option was introduced in 2017.01 version.

During the wizard you can choose to apply a default configuration for France : see *Wizard configuration step*. This option introduce a set of default parameters that will be useful particularly for a *XiVO PBX* installed in France.

The default parameters configured are listed in the sections below.

Default SIP parameters

In Services -> IPBX -> General settings -> SIP Protocol the following parameters are changed:

- for call presentation (in tab *Default*):
 - Trust the Remote-Party-ID is set to Yes
 - Send the Remote-Party-ID is set to PAI
- for codecs order (in tab *Signaling*): G.711 A-law > G.722 > G.729A > H.264 is the default order.

Outgoing call rules

A set of default outgoing call rules according to the French numbering plan is set up by default. In *Services -> IPBX -> Call management -> Outgoing calls* two outgoing call rules are defined:

- 1. sortants-france: pattern for french numbering plan numbers,
- 2. *urgences-france*: pattern for french emergency numbers.

Note: For these outgoing call rules, a 'void' cutomized trunk named 'Local/template_a_changer' is defined. This one must be deleted or modified according to your configuration.

Right call rules

Also, a set of right call is predefined according to the set of outgoing call rules. In *Services -> IPBX -> Call management -> Call permissions* you will find the following preconfigured right call group:

| Name ¹ | Action | Description |
|--------------------------|--------|-------------------------------------|
| national | Allow | Patterns for national numbers. |
| urgences | Allow | Patterns for emergency numbers. |
| mobiles | Allow | Patterns for mobile numbers. |
| numeros-a-valeur-ajoutee | Allow | Patterns for services numbers. |
| international | Allow | Patterns for international numbers. |
| refuser-tout | Allow | Patterns for all. |

Default template device

The 'Default config device' template (in *Configuration -> Provisioning -> Template device*) has preconfigured language and time zone.

3.1.4 Post Installation

Here are a few configuration options that are commonly changed once the installation is completed. Please note that these changes are optional.

Display called name on internal calls

Note: Configured by default if you checked the *Apply default onfiguration for France* at the wizard time (see *Wizard configuration step*).

¹ this name can be used when importing users. See *Call permissions* section in *User import*.

When you call internally another phone of the system you would like your phone to display the name of the called person (instead of the dialed number only). To achieve this you must change the following SIP options:

- Services \rightarrow IPBX \rightarrow General settings \rightarrow SIP Protocol \rightarrow Default:
 - Trust the Remote-Party-ID: yes,
 - Send the Remote-Party-ID: select PAI

Incoming caller number display

The caller ID number on incoming calls depends on what is sent by your operator. You can modify it via the file /etc/xivo/asterisk/xivo_in_callerid.conf.

Note: The reverse directory lookup use the caller ID number after it has been modified by xivo_in_callerid.conf

Examples:

- If you use a prefix to dial outgoing numbers (like a 0) you should add a 0 to all the add = sections,
- You may want to display incoming numbers in E.164 format. For example, you can change the [national1] section to:

```
callerid = ^0[1-9]\d{8}$
strip = 1
add = +33
```

To enable the changes you have to restart xivo-agid:

service xivo-agid restart

Time and date

- Configure your locale and default time zone device template => Configuration → Provisioning → Template Device by editing the default template
- Configure the timezone in => Services \rightarrow IPBX \rightarrow General settings \rightarrow Advanced \rightarrow Timezone
- If needed, reconfigure your timezone for the system:

dpkg-reconfigure tzdata

Codecs

Note: Configured by default if you checked the *Apply default onfiguration for France* at the wizard time (see *Wizard configuration step*).

You should also select default codecs. It obviously depends on the telco links, the country, the phones, the usage, etc. Here is a typical example for Europe (the main goal in this example is to select *only* G.711 A-Law instead of both G.711 A-Law and G.711 μ -Law by default):

- SIP : Services \rightarrow IPBX \rightarrow General settings \rightarrow SIP Protocol \rightarrow Signaling:
 - Customize codec : enabled
 - Codec list:

G.711 A-Law G.722 G.729A H.264

3.1.5 Telephony Hardware

This section describes how to configure the telephony hardware on a XiVO server.

```
Note: Currently XiVO supports only Digium Telephony Interface cards
```

The configuration process is the following :

Load the correct DAHDI modules

For your Digium card to work properly you must load the appropriate DAHDI kernel module. This is done via the file /etc/dahdi/modules and this page will guide you through its configuration.

Know which card is in your server

You can see which cards are detected by issuing the dahdi_hardware command:

```
dahdi_hardware
pci:0000:05:0d.0 wcb4xxp- d161:b410 Digium Wildcard B410P
pci:0000:05:0e.0 wct4xxp- d161:0205 Wildcard TE205P (4th Gen)
```

This command gives the card name detected and, more importantly, the DAHDI kernel module needed for this card. In the above example you can see that two cards are detected in the system:

- a Digium B410P which needs the wcb4xxp module
- and a Digium TE205P which needs the wct4xxp module

Create the configuration file

Now that we know the modules we need, we can create our configuration file:

1. Create the file /etc/dahdi/modules:

touch /etc/dahdi/modules

2. Fill it with the modules name you found with the dahdi_hardware command (one module name per line). In our example, your /etc/dahdi/modules file should contain the following lines:

wcb4xxp wct4xxp

Note: In the /usr/share/dahdi/modules.sample file you can find all the modules supported in your XiVO version.

Apply the configuration

To apply the configuration, restart the services:

xivo-service restart

Next step

Now that you have loaded the correct module for your card you must:

- 1. check if you need to follow one of the Specific configuration sections below,
- 2. and continue with the next configuration step which is to *configure the echo canceller*.

Specific configuration

This section lists some specific configuration. You should not follow them unless you have a specific need.

TE13x, TE23x, TE43x: E1/T1 selection

With E1/T1 cards you must select the correct *line mode* between:

- E1 : the European standard,
- and T1 : North American standard

For old generation cards (TE12x, TE20x, TE40x series) the line mode is selected via a physical jumper.

For new generation cards like TE13x, TE23x, TE43x series the line mode is selected by configuration.

If you're configuring one of these **TE13x**, **T23x**, **T43x** cards then you **MUST** create a configuration file to set the line mode to E1:

1. Create the file /etc/modprobe.d/xivo-wcte-linemode.conf:

touch /etc/modprobe.d/xivo-wcte-linemode.conf

2. Fill it with the following lines replacing DAHDI_MODULE_NAME by the correct module name (wcte13xp, wcte43x...):

```
# set the card in E1/T1 mode
options DAHDI_MODULE_NAME default_linemode=e1
```

3. Then, restart the services:

xivo-service restart

Hardware Echo-cancellation

It is *recommended* to use telephony cards with an hardware echo-canceller module.

Warning: with TE13x, TE23x and TE43x cards, you MUST install the echo-canceller firmware. Otherwise the card won't work properly.

Know which firmware you need

If you have an hardware echo-canceller module you have to install its firmware.

You first need to know which firmware you have to install. The simplest way is to restart dahdi and then to lookup in the dmesg which firmware does DAHDI request at startup:

```
xivo-service restart
dmesg |grep firmware
[5461540.738209] wct4xxp 0000:01:0e.0: firmware: agent aborted loading dahdi-fw-
oct6114-064.bin (not found?)
[5461540.738310] wct4xxp 0000:01:0e.0: VPM450: firmware dahdi-fw-oct6114-064.bin_
onot available from userspace
```

In the example above you can see that the module wct4xxp requested the dahdi-fw-oct6114-064.bin firmware file but did not found it. But you now know that you need the dahdi-fw-oct6114-064.bin firmware.

Install the firmware

When you know which firmware you need you can install it with xivo-fetchfw utility.

1. Use xivo-fetchfw to find the name of the package. You can search for digium occurrences in the available packages:

xivo-fetchfw search digium

2. Find the package name which matches the firmware file you need. In our example, we need the dahdi-fw-oct6114-064.bin file which is supplied by the package named digium-oct6114-064:

xivo-fetchfw install digium-oct6114-064

Activate the Hardware Echo-cancellation

Now that you installed hardware echo-canceller firmware you must activate it in /etc/asterisk/ chan_dahdi.conf file:

echocancel = 1

Apply the configuration

To apply the configuration, restart the services:

xivo-service restart

Next step

Now that you have loaded the correct module for your card you must:

- 1. check if you need to follow one of the Specific configuration sections below,
- 2. and continue with the next configuration step which is to *configure your card* according to the operator links.

Specific configuration

This section describes some specific configuration. You should not follow them unless you have a specific need.

Use the Hardware Echo-canceller for DTMF detection

If you have an hardware echo-canceller you may want to use it to detect the DTMF signal (instead of asterisk).

1. Create the file /etc/modprobe.d/xivo-hwec-dtmf.conf:

touch /etc/modprobe.d/xivo-hwec-dtmf.conf

2. Fill it with the following lines replacing DAHDI_MODULE_NAME by the correct module name (wcte13xp, wct4xxp...):

options DAHDI_MODULE_NAME vpmdtmfsupport=1

3. Then, restart the services:

xivo-service restart

Card configuration

Now that you have *loaded the correct DAHDI modules* and *configured the echo canceller* you can proceed with the card configuration. Follow one of the appropriate link below :

BRI card configuration

Verifications

Verify that the wcb4xxp module is uncommented in /etc/dahdi/modules.

If it wasn't, do again the step Load the correct DAHDI modules.

Generate DAHDI configuration

Issue the command:

dahdi_genconf

Warning: it will erase all existing configuration in /etc/dahdi/system.conf and /etc/asterisk/ dahdi-channels.conf files !

Configure

DAHDI system.conf configuration

First step is to check /etc/dahdi/system.conf file:

- check the span numbering,
- if needed change the clock source,

See detailed explanations of this file in the /etc/dahdi/system.conf section.

Below is an example for a typical french BRI line span:

```
# Span 1: B4/0/1 "B4XXP (PCI) Card 0 Span 1" (MASTER) RED
span=1,1,0,ccs,ami
# termtype: te
bchan=1-2
hardhdlc=3
echocanceller=mg2,1-2
```

Asterisk dahdi-channels.conf configuration

Then you have to modify the /etc/asterisk/dahdi-channels.conf file:

• remove the unused lines like:

context = default group = 63

- change the context lines if needed,
- the signalling should be one of:
 - bri_net
 - bri_cpe
 - bri_net_ptmp
 - bri_cpe_ptmp

See some explanations of this file in the /etc/asterisk/dahdi-channels.conf section.

Below is an example for a typical french BRI line span:

Next step

Now that you have configured your BRI card:

- 1. you must check if you need to follow one of the Specific configuration sections below,
- 2. then, if you have another type of card to configure, you can go back to the configure your card section,
- 3. if you have configured all your card you have to configure the DAHDI interconnections in the web interface.

Specific configuration

You will find below 3 configurations that we recommend for BRI lines. These configurations were tested on different type of french BRI lines with success.

Note: The pre-requisites are:

• XiVO >= 14.12,

• Use per-port dahdi interconnection (see the DAHDI interconnections section)

If you don't know which one to configure we recommend that you try each one after the other in this order:

- 1. PTMP without layer1/layer2 persistence
- 2. PTMP with layer1/layer2 persistence
- 3. PTP with layer1/layer2 persistence

PTMP without layer1/layer2 persistence

In this mode we will configure asterisk and DAHDI:

- to use Point-to-Multipoint (PTMP) signalling,
- · and to leave Layer1 and Layer2 DOWN

Follow theses steps to configure:

 Before the line #include dahdi-channels.conf add, in file /etc/asterisk/chan_dahdi. conf, the following lines:

```
layer1_presence = ignore
layer2_persistence = leave_down
```

2. In the file /etc/asterisk/dahdi-channels.conf use bri_cpe_ptmp signalling:

signalling = bri_cpe_ptmp

3. Create the file /etc/modprobe.d/xivo-wcb4xxp.conf to deactivate the layer1 persistence:

touch /etc/modprobe.d/xivo-wcb4xxp.conf

4. Fill it with the following content:

```
options wcb4xxp persistentlayer1=0
```

5. Then, apply the configuration by restarting the services:

xivo-service restart

Note: Expected behavior:

- The dahdi show status command should show the BRI spans in RED status if there is no call,
- For outgoing calls the layer1/layer2 should be brought back up by the XiVO (i.e. asterisk/chan_dahdi),
- For incoming calls the layer1/layer2 should be brought back up by the operator,
- You can consider that there is a problem only if incoming or outgoing calls are rejected.

PTMP with layer1/layer2 persistence

In this mode we will configure asterisk and DAHDI:

- to use Point-to-Multipoint (PTMP) signalling,
- and to keep Layer1 and Layer2 UP

Follow theses steps to configure:

 Before the line #include dahdi-channels.conf add, in file /etc/asterisk/chan_dahdi. conf, the following lines:

```
layer1_presence = required
layer2_persistence = keep_up
```

2. In the file /etc/asterisk/dahdi-channels.conf use bri_cpe_ptmp signalling:

signalling = bri_cpe_ptmp

3. If it exists, delete the file /etc/modprobe.d/xivo-wcb4xxp.conf:

rm /etc/modprobe.d/xivo-wcb4xxp.conf

4. Then, apply the configuration by restarting the services:

xivo-service restart

Note: Expected behavior:

- The dahdi show status command should show the BRI spans in OK status even if there is no call,
- In asterisk CLI you may see the spans going Up/Down/Up : it is *a problem* only if incoming or outgoing calls are rejected.

PTP with layer1/layer2 persistence

In this mode we will configure asterisk and DAHDI:

- to use Point-to-Point (PTP) signalling,
- and use default behavior for Layer1 and Layer2.

Follow theses steps to configure:

- In file /etc/asterisk/chan_dahdi.conf remove all occurrences of layer1_presence and layer2_persistence options.
- 2. In the file /etc/asterisk/dahdi-channels.conf use bri_cpe signalling:

signalling = bri_cpe

3. If it exists, delete the file /etc/modprobe.d/xivo-wcb4xxp.conf:

rm /etc/modprobe.d/xivo-wcb4xxp.conf

4. Then, apply the configuration by restarting the services:

xivo-service restart

Note: Expected behavior:

- The dahdi show status command should show the BRI spans in OK status even if there is no call,
- In asterisk CLI you should not see the spans going Up and Down : if it happens, it is *a problem* only if incoming or outgoing calls are rejected.

PRI card configuration

Verifications

Verify that the correct module is configured in /etc/dahdi/modules depending on the card you installed in your server.

If it wasn't, do again the step Load the correct DAHDI modules

Warning: TE13x, TE23x, TE43x cards :

- these cards need a specific dahdi module configuration. See *TE13x*, *TE23x*, *TE43x*: *E1/T1 selection* paragraph,
- you **MUST** install the correct echo-canceller firmware to be able to use these cards. See *Hardware Echo-cancellation* paragraph.

Generate DAHDI configuration

Issue the command:

dahdi_genconf

Warning: it will erase all existing configuration in /etc/dahdi/system.conf and /etc/asterisk/ dahdi-channels.conf files !

Configure

DAHDI system.conf configuration

First step is to check /etc/dahdi/system.conf file:

- check the span numbering,
- if needed change the clock source,
- usually (at least in France) you should remove the crc4

See detailed explanations of this file in the /etc/dahdi/system.conf section.

Below is an example for a typical french PRI line span:

```
# Span 1: TE2/0/1 "T2XXP (PCI) Card 0 Span 1" CCS/HDB3/CRC4 RED
span=1,1,0,ccs,hdb3
# termtype: te
bchan=1-15,17-31
dchan=16
echocanceller=mg2,1-15,17-31
```

Asterisk dahdi-channels.conf configuration

Then you have to modify the /etc/asterisk/dahdi-channels.conf file:

• remove the unused lines like:

context = default group = 63

- change the context lines if needed,
- the signalling should be one of:
 - pri_net
 - pri_cpe

Below is an example for a typical french PRI line span:

Next step

Now that you have configured your PRI card:

- 1. you must check if you need to follow one of the Specific configuration sections below,
- 2. then, if you have another type of card to configure, you can go back to the configure your card section,
- 3. if you have configured all your card you have to configure the DAHDI interconnections in the web interface.

Specific configuration

Multiple PRI cards and sync cable

If you have several PRI cards in your server you should link them with a synchronization cable to share the exact same clock.

To do this, you need to:

- use the coding wheel on the Digium cards to give them an order of recognition in DAHDI/Asterisk (see Digium_telephony_cards_support),
- daisy-chain the cards with a sync cable (see Digium_telephony_cards_support),
- load the DAHDI module with the timingcable=1 option.

Create /etc/modprobe.d/xivo-timingcable.conf file and insert the line:

options DAHDI_MODULE_NAME timingcable=1

Where DAHDI_MODULE_NAME is the DAHDI module name of your card (e.g. wct4xxp for a TE205P).

Analog card configuration

Limitations

• XiVO does not support hardware echocanceller on the TDM400 card. Users of TDM400 card willing to setup an echocanceller will have to use a software echocanceller like OSLEC.

Verifications

Verify that one of the {wctdm, wctdm24xxp} module is uncommented in /etc/dahdi/modules depending on the card you installed in your server.

If it wasn't, do again the step Load the correct DAHDI modules

Note: Analog cards work with card module. You must add the appropriate card module to your analog card. Either:

- an FXS module (for analog equipment phones, ...),
- an FXO module (for analog line)

Generate DAHDI configuration

Issue the command:

dahdi_genconf

Warning: it will erase all existing configuration in /etc/dahdi/system.conf and /etc/asterisk/ dahdi-channels.conf files !

Configure

DAHDI system.conf configuration

First step is to check /etc/dahdi/system.conf file:

• check the span numbering,

See detailed explanations of this file in the /etc/dahdi/system.conf section.

Below is an example for a typical FXS analog line span:

```
# Span 2: WCTDM/4 "Wildcard TDM400P REV I Board 5"
fxoks=32
echocanceller=mg2,32
```

Asterisk dahdi-channels.conf configuration

Then you have to modify the /etc/asterisk/dahdi-channels.conf file:

• remove the unused lines like:

```
context = default
group = 63
```

- change the context and callerid lines if needed,
- the signalling should be one of:
 - fxo_ks for FXS lines -yes it is the reverse
 - fxs_ks for FXO lines yes it is the reverse

Below is an example for a typical french PRI line span:

```
; Span 2: WCTDM/4 "Wildcard TDM400P REV I Board 5"
signalling=fxo_ks
callerid="Channel 32" <4032>
mailbox=4032
group=5
context=default
channel => 32
```

Next step

Now that you have configured your PRI card:

- 1. you must check if you need to follow one of the Specific configuration sections below,
- 2. then, if you have another type of card to configure, you can go back to the configure your card section,
- 3. if you have configured all your card you have to configure the DAHDI interconnections in the web interface.

Specific configuration

FXS modules

If you use **FXS** modules you should create the file /etc/modprobe.d/xivo-tdm and insert the line:

options DAHDI_MODULE_NAME fastringer=1 boostringer=1

Where DAHDI_MODULE_NAME is the DAHDI module name of your card (e.g. wctdm for a TDM400P).

FXO modules

If you use FXO modules you should create file /etc/modprobe.d/xivo-tdm:

options DAHDI_MODULE_NAME opermode=FRANCE

Where DAHDI_MODULE_NAME is the DAHDI module name of your card (e.g. wctdm for a TDM400P).

Voice Compression Card configuration

Verifications

Verify that the wctc4xxp module is uncommented in /etc/dahdi/modules. If it wasn't, do again the step *Load the correct DAHDI modules*.

Configure

To configure the card you have to:

1. Install the card firmware:

xivo-fetchfw install digium-tc400m

2. Comment out the following line in /etc/asterisk/modules.conf:

noload = codec_dahdi.so

3. Restart asterisk:

```
service asterisk restart
```

Next step

Now that you have configured your Voice Compression card:

- 1. you must check if you need to follow one of the Specific configuration sections below,
- 2. then, if you have another type of card to configure, you can go back to the *configure your card* section.

Specific configuration

Select the transcoding mode

The Digium TC400 card can be used to transcode:

- 120 G.729a channels,
- 92 G.723.1 channels,
- or 92 G.729a/G.723.1 channels.

Depending on the codec you want to transcode, you can modify the mode parameter which can take the following value:

- mode = mixed : this the default value which activates transcoding for 92 channels in G.729a or G.723.1 (5.3 Kbit and 6.3 Kbit)
- mode = g729 : this option activates transcoding for 120 channels in G.729a
- mode = g723: this option activates transcoding for 92 channels in G.723.1 (5.3 Kbit et 6.3 Kbit)
- 1. Create the file /etc/modprobe.d/xivo-transcode.conf:

touch /etc/modprobe.d/xivo-transcode.conf

2. And insert the following lines:

options wctc4xxp mode=g729

3. Apply the configuration by restarting the services:

xivo-service restart

4. Verify that the card is correctly seen by asterisk with the transcoder show CLI command - this command should show the encoders/decoders registered by the TC400 card:

```
*CLI> transcoder show
0/0 encoders/decoders of 120 channels are in use.
```

Apply configuration

If you didn't do it already, you have to restart the services to apply the configuration:

xivo-service restart

At the end of this page you will also find some general notes and DAHDI.

Notes on configuration files

/etc/dahdi/system.conf

A span is created for each card port. Below is an example of a standard E1 port:

```
span=1,1,0,ccs,hdb3
dchan=16
bchan=1-15,17-31
echocanceller=mg2,1-15,17-31
```

Each span has to be declared with the following information:

span=<spannum>, <timing>, <LBO>, <framing>, <coding>[, crc4]

- spannum: corresponds to the span number. It starts to 1 and has to be incremented by 1 at each new span. This number MUST be unique.
- timing : describes the how this span will be considered regarding the synchronization :
 - 0 : do not use this span as a synchronization source,
 - 1 : use this span as the primary synchronization source,
 - 2 : use this span as the secondary synchronization source etc.
- LBO : 0 (not used)
- framing : correct values are ccs or cas. For ISDN lines, ccs is used.
- coding: correct values are hdb3 or ami. For example, hdb3 is used for an E1 (PRI) link, whereas ami is used for T0 (french BRI) link.
- crc4 : this is a framing option for PRI lines. For example it is rarely use in France.

Note that the dahdi_genconf command should usually give you the correct parameters (if you correctly set the cards jumper). All these information should be checked with your operator.

/etc/asterisk/chan_dahdi.conf

This file contains the general parameters of the DAHDI channel. It is not generated via the dahdi_genconf command.

/etc/asterisk/dahdi-channels.conf

This file contains the parameters of each channel. It is generated via the dahdi_genconf command.

Below is an example of span definition:

```
group=0,11
context=from-extern
switchtype = euroisdn
signalling = pri_cpe
channel => 1-15,17-31
```

Note that parameters are read from top to bottom in a last match fashion and are applied to the given channels when it reads a line channel =>.

Here the channels 1 to 15 and 17 to 31 (it is a typical E1) are set:

- in groups 0 and 11 (see DAHDI interconnections)
- in context from-extern : all calls received on these channels will be sent in the context from-extern

• and configured with switchtype euroisdn and signalling pri_cpe

Debug

Check IRQ misses

It's always useful to verify if there isn't any missed IRQ problem with the cards.

Check:

cat /proc/dahdi/

If the IRQ misses counter increments, it's not good:

```
cat /proc/dahdi/1
Span 1: WCTDM/0 "Wildcard TDM800P Board 1" (MASTER)
IRQ misses: 1762187
1 WCTDM/0/0 FXOKS (In use)
2 WCTDM/0/1 FXOKS (In use)
3 WCTDM/0/2 FXOKS (In use)
4 WCTDM/0/3 FXOKS (In use)
```

Digium gives some hints in their Knowledge Base here : http://kb.digium.com/entry/1/63/

PRI Digium cards needs 1000 interruption per seconds. If the system cannot supply them, it increment the IRQ missed counter.

As indicated in Digium KB you should avoid shared IRQ with other equipments (like HD or NIC interfaces).

XiVO UC

3.1.6 XiVO UC add-on

This page describes how to install XiVO UC on the XiVO PBX server and how to use it. By XiVO UC we mean a subset of XiVO CC application, namely the Web and Desktop Assistant.

Prerequisites

Important: Your XiVO PBX server MUST meet the following requirements:

- OS : Debian 8 (jessie), 64 bits
- 4 GB of RAM
- 4-core CPU
- 20 GB of free disk space
- you have a *XiVO PBX* installed in a compatible version (basically the two components XiVO and *XiVO UC* have to be in the *same* version).
- the *XiVO PBX* is setup (wizard must be passed) with users, queues and agents, you must be able to place and answer calls.

Warning:

• By default XiVO-UC installation will pre-empt network subnets 172.17.0.0/16 and 172.18.0.0/16. If these subnets are already used, some manual steps will be needed to be able to install use XiVO-UC. These steps are not described here.

 After installing the XiVO UC the XiVO PBX Administration will be only available at https://XiVO_ PBX_IP/admin

Install process overview

The installation and configuration of *XiVO UC* is handled by the xivouc-installer script provided with XiVO. You will be asked few questions during the process:

- the XiVO PBX IP address,
- and whether or not you want to restart XiVO PBX by the installer or later

The xivouc-installer script will install packages *xivouc* and *xivouc-nginx-cfg*.

Install XiVO UC

On XiVO PBX, run XiVO UC installer script:

xivouc-installer

If you choose to restart *XiVO PBX* later, please do so as soon as possible to apply the modifications made by the installer. Until then, the *XiVO UC* will not be able to connect correctly to the database.

To restart XiVO services manually, run

```
xivo-service restart all
```

After-install steps

After a successful installation, start docker containers using the installed xivocc-dcomp script:

xivocc-dcomp up -d

Note: Please, ensure your server date is correct before starting. If system date differs too much from correct date, you may get an authentication error preventing download of the docker images.

Upgrade

Packages xivouc-nginx-cfg and xivouc will be upgraded automatically during XiVO PBX upgrade.

The XiVO UC upgrade must then be completed by pulling new docker containers and starting them:

xivocc-dcomp pull xivocc-dcomp up -d

Using XiVO UC

After this installation you have on your XiVO PBX the XiVO UC.

You can now use the *XiVO UC* applications* using the XiVO PBX IP address. For example you can access the Web Assistant at :

https://XIVO_PBX_IP

The XiVO PBX Admin interface is now available at: https://XIVO_PBX_IP/admin

Monitoring

You can monitor and control XiVO UC components from the XiVO web interface (see Monitoring).

Uninstallation

Uninstallation consists of these steps:

- 1. purge the xivouc package: apt-get purge xivouc
- 2. install the default nginx configuration: apt-get install xivo-nginx-cfg

Warning: Do not purge the xivouc-installer package! It is required by XiVO.

XiVO Swarm

3.1.7 XiVO Orchestration

This page describes how to install XiVO orchestration and how to use it.

The orchestration is done using Docker and its built-in multi-host and multi-container orchestration called Swarm.

Prerequisites

Important: Your XiVO PBX server MUST meet the following requirements:

- A swarm manager, which can be your XiVO PBX server
- A swarm worker, which can be your XiVO CC server
- OS : Debian 8 (jessie), 64 bits
- 4 GB of RAM
- 4-core CPU
- 20 GB of free disk space
- you have a XiVO PBX installed in a compatible version
- the *XiVO PBX* is setup (wizard must be passed) with users, queues and agents, you must be able to place and answer calls

Install process overview

The configuration and deployment is handled by xivo-orchestration package, which does not come with the XiVO installation. This package must be installed manually.

The join and leave swarm actions on worker are handled by the script xivo-worker-node which comes together with xivocc-installer package.

The deployment consist of minimum 1 manager and minimum 1 worker.

Manager

The swarm initialization is done on the manager which the workers are joining to or leaving from. The swarm manager can start and stop the services and in XiVO environment the manager will be *XiVO PBX*.

Worker

The swarm worker can join or leave the swarm network and behaves passively in terms of swarm management.

Important: Your worker may have xivocc-installer installed, but must not be running any **XiVO CC** components. All docker containers must be removed before the swarm installation. And the xivocc-dcomp script must not be used to start any containers.

Preparation beforehand

• Note XiVO AMI secret from /etc/asterisk/manager.d/02-xivocc.conf or generate one

```
< /dev/urandom tr -dc A-Za-z0-9 | head -c${1:-11} | xargs echo
```

• On the node running the database (XuC), create the database folder

```
mkdir -p /var/lib/postgresql/data
```

- Gather the hostnames of your nodes, which will be needed during the first run configuration. Every node must use its unique hostname that will be used in configuration dialogs.
- Create folder for logs on **all** nodes:

```
mkdir -p /var/log/xivocc
chown -R daemon:daemon /var/log/xivocc
```

• On your worker nodes, install Docker-CE, please follow the instructions:

Install Docker-CE

Important: If you have docker proxy, please remove it from /etc/system/docker.service.d/mirror.conf, otherwise the installation will fail.

```
apt-get remove docker docker-engine docker.io
apt-get update
sudo apt-get install \
apt-transport-https \
ca-certificates \
curl \
gnupg2 🔪
software-properties-common
curl -fsSL https://download.docker.com/linux/$(. /etc/os-release; echo "$ID")/gpg_
\leftrightarrow | sudo apt-key add -
sudo add-apt-repository \
  "deb [arch=amd64] https://download.docker.com/linux/$(. /etc/os-release; echo "
⇔$ID") \
 $(lsb_release -cs) \
 stable"
apt-get update
apt-get install docker-ce
```

Configure XiVO orchestration

Manager

On XiVO PBX, install the xivo-orchestration package.

apt-get install xivo-orchestration-service

Run and follow the instructions on dialog screens.

xivo-orchestration start

Copy the worker token after successful swarm manager initialization.

docker swarm join-token worker | grep token | awk '{ print \$5 }'

SpagoBI

Edit the compose file for the chosen installation, find section spagobi and replace \${REPORTING_HOST} with IP address of the node with SpagoBI.

- JAVA_OPTS=-Dexternal.host=REPORTING_HOST_IP

PostgresSQL

Then reload PostgreSQL configuration and start the swarm.

```
/etc/init.d/postgresql restart
```

XiVO-UC

If you chose to install XiVO UC on a single node, you must manually remove the nginx section from the /etc/ docker/swarm/xivo-compose-xivouc.yml compose file.

Worker

Go to your swarm worker, which can be any available machine with xivocc-installer installed:

xivo-worker-node join

Enter the worker token from previous step when prompted.

or without xivocc-installer installed:

docker swarm join --token SWARM_TOKEN MANAGER_IP:2377

Repeat this step in case you have more workers.

Nginx

Go to your worker node with XUC and install certificates for the xivoxc_nginx container.

```
SSLDIR=/etc/docker/nginx/ssl
mkdir -p $SSLDIR
openssl req -nodes -newkey rsa:2048 -keyout $SSLDIR/xivoxc.key -out $SSLDIR/
ivoxc.csr -subj "/C=FR/ST=/L=/O=Avencall/OU=/CN=$(hostname --fqdn)"
openssl x509 -req -days 3650 -in $SSLDIR/xivoxc.csr -signkey $SSLDIR/xivoxc.
ivkey -out $SSLDIR/xivoxc.crt
openssl x509 -req -days 3650 -in $SSLDIR/xivoxc.csr -signkey $SSLDIR/xivoxc.
ivkey -out $SSLDIR/xivoxc.crt
```

SpagoBI

Go to your worker node with spagobi and create a subfolder for logs:

```
mkdir -p /var/log/xivocc/spagobi
chown -R daemon:daemon /var/log/xivocc
```

Recording

Go to your worker node with recording and create a folder for recordings:

mkdir /var/spool/recording-server

Important: Wait a few seconds for all services come up on each worker. The services should be running on the workers and manager as configured in the swarm configuration dialog.

After-install steps

In order to use configmgt and xuc server without IP access, an authorization token is required.

Navigate to XiVO Web Interface - Configuration - Management - Web Services Access and edit the xivows user. On tab ACL create an ACL with value # and save the form.

To generate the token:

```
curl -X POST --header 'Content-Type: application/json' \
--header 'Accept: application/json' \
-u xivows:xivows \
-d '{
    "backend": "xivo_service",
    "expiration": 5656565600
    }' \
--insecure 'https://IP_OF_YOUR_XIVO:9497/0.1/token'
```

Add this token to the custom.env as XIVO_CONFD_AUTH_TOKEN=token on manager node.

Verify the deployment

Important: The docker images, if not already present on the nodes, are downloading silently in the background.

1. You can see the status of the services on each node by navigating to

http://YOUR_MANAGER_IP:8080

To check whether the services were correctly deployed and the worker(s) are connected to the swarm check on each:

Manager

docker node 1s

Should list minimum 1 manager and 1 worker.

docker service ls

Should list all XiVO CC components running as services.

docker ps

Should list all XiVO CC components running on this manager.

Worker

docker ps

Should list all XiVO CC components running on this worker.

Upgrading

3.1.8 Upgrading

Upgrading a *XiVO PBX* is done by executing commands through a terminal on the server. You can connect to the server either through SSH or with a physical console.

Overview

To upgrade your *XiVO PBX*, you have to use both xivo-dist and *xivo-upgrade* tools. These tools handle the process of upgrading:

- the system (Debian packages)
- and the XiVO PBX packages

Warning: The following applies to *XiVO PBX* >= 2016.03. For older version, see *Version-specific upgrade procedures* section.

There are two cases:

- 1. Upgrade to an LTS version of XiVO PBX,
- 2. Upgrade to an Intermediate version of XiVO PBX,

Warning: Note that it is not possible to downgrade to any version.

Upgrade to an LTS version

To upgrade to a XiVO PBX LTS version you have to update the sources list by using the *xivo-dist* command:

xivo-dist <XiVO LTS VERSION>

Currently there are two XiVO PBX LTS versions:

1. (latest) XiVO Polaris (2017.11) - released 2017/10/09:

xivo-dist xivo-polaris

2. (old) XiVO Five (2017.03) - released 2017/04/03: see XiVO Five documentation.

Upgrade to an Intermediate version

Note: Intermediate versions have a limited support. You should install LTS version only.

Between XiVO PBX LTS versions we release **Intermediate** versions (to which is given a limited support). To upgrade to a *specific* **Intermediate** version, you have to update the sources to point to this *specific* version. You have to do it with the xivo-dist command. For example, if you want to upgrade to **2017.06**:

xivo-dist xivo-2017.06-latest

Preparing the upgrade

To prepare the upgrade you should:

- 1. Read carefully the Release Notes starting from your current version to the version you target.
- 2. Check if you are in a specific setup that requires a *specific procedure* to be followed (e.g. *Upgrading a cluster*).
- 3. Finally, you can download the packages beforehand by running xivo-upgrade -d. This is not mandatory, but it does not require stopping any service, so it may be useful to reduce the downtime of the server while upgrading.

Upgrade

Note: About *xivo-upgrade* script see:

xivo-upgrade script

Usage

Note:

- You can't use xivo-upgrade if you have not run the wizard yet
- Upgrading from a version prior to *XiVO PBX* 1.2 is not supported.
- When upgrading XiVO, you **must** also upgrade **all** associated XiVO Clients. There is currently no retrocompatibility on older *XiVO PBX* Client versions.

This script will update XiVO PBX and restart all services.

There are 2 options you can pass to xivo-upgrade:

- -d to only download packages without installing them. This will still upgrade the package containing xivo-upgrade and xivo-service.
- -f to force upgrade, without asking for user confirmation

xivo-upgrade uses the following environment variables:

• XIVO_CONFD_PORT to set the port used to query the HTTP API of xivo-confd (default is 9486)

Troubleshooting

Postgresql

When upgrading XiVO, if you encounter problems related to the system locale, see *PostgreSQL localization* errors.

xivo-upgrade

If xivo-upgrade fails or aborts in mid-process, the system might end up in a faulty condition. If in doubt, run the following command to check the current state of xivo's firewall rules:

iptables -nvL

If, among others, it displays something like the following line (notice the DROP and 5060):

```
0 0 DROP udp -- * * 0.0.0.0/0 0.0.0.0/0 
→ udp dpt:5060
```

Then your XiVO will not be able to register any SIP phones. In this case, you must delete the DROP rules with the following command:

iptables -D INPUT -p udp --dport 5060 -j DROP

Repeat this command until no more unwanted rules are left.

- 1. For custom setups, follow the required procedures described below (e.g. Upgrading a cluster).
- 2. When ready, launch the upgrade process. All XiVO PBX services will be stopped during the process:

xivo-upgrade

- 3. When finished, check that all services are running (the list is displayed at the end of the upgrade).
- 4. Check that services are correctly working like SIP registration, ISDN link status, internal/incoming/outgoing calls, XiVO Client connections etc.

Specific procedures

Upgrading a cluster

Here are the steps for upgrading a cluster, i.e. two XiVO with High Availability (HA):

1. On the master : deactivate the database replication by commenting the cron in /etc/cron.d/ xivo-ha-master

- 2. On the slave, deactivate the xivo-check-master-status script cronjob by commenting the line in /etc/ cron.d/xivo-ha-slave
- 3. On the slave, start the upgrade:

xivo-slave:~\$ xivo-upgrade

4. When the slave has finished, start the upgrade on the master:

xivo-master:~\$ xivo-upgrade

5. When done, launch the database replication manually:

xivo-master:~\$ xivo-master-slave-db-replication <slave ip>

6. Reactivate the cronjobs (see steps 1 and 2)

Migrate XiVO from i386 (32 bits) to amd64 (64 bits)

There is no fully automated method to migrate XiVO from 1386 to amd64.

The procedure is:

- 1. Upgrade your i386 machine to XiVO >= 15.13
- 2. Install a XiVO amd64 using the same version as the upgraded XiVO i386
- 3. Make a backup of your XiVO i386 by following the backup procedure
- 4. Copy the backup tarballs to the XiVO amd64
- 5. Restore the backup by following the restore procedure

Before starting the services after restoring the backup on the XiVO amd64, you should ensure that there won't be a conflict between the two machines, e.g. two DHCP servers on the same broadcast domain, or both XiVO fighting over the same SIP trunk register. You can disable the XiVO i386 by running:

xivo-service stop

But be aware the XiVO 1386 will be enabled again after you reboot it.

Asterisk upgrade procedure

Introduction

There are three distributions available for each release (since release 2017.03).

For XiVO archive repositories

```
deb http://mirror.xivo.solutions/archive/ xivo-VERSION-latest main
deb http://mirror.xivo.solutions/archive/ xivo-VERSION-candidate main
deb http://mirror.xivo.solutions/archive/ xivo-VERSION-oldstable main
```

Alike for XiVO production repositories

```
deb http://mirror.xivo.solutions/debian/ xivo-five main
deb http://mirror.xivo.solutions/debian/ xivo-five-candidate main
deb http://mirror.xivo.solutions/debian/ xivo-five-oldstable main
```

- The distribution latest contains the current stable version of XiVO PBX and Asterisk.
- The distribution candidate contains only Asterisk in higher version than the current.
- The distribution oldstable contains only Asterisk in the previous stable version.

Example

| Repository | Distribution | Sec- | Content |
|----------------------------|---------------------|------|---|
| | | tion | |
| mir- | xivo-2017.03- | main | latest-built-and-tested-version (e.g. asterisk- |
| ror.xivo.solutions/archive | candidate | | 13.14.0) |
| mir- | xivo-2017.03-latest | main | most-stable-known-version (e.g. asterisk- |
| ror.xivo.solutions/archive | | | 13.13.1) |
| mir- | xivo-2017.03- | main | old-most-stable-known-version (e.g. asterisk- |
| ror.xivo.solutions/archive | previous | | 13.10.0) |

Upgrade to asterisk candidate

Before integrating a new version of asterisk in *XiVO PBX*, we first build it and deliver it in the xivo-VERSION-candidate distribution of our repository.

The goal is to make it available for specific cases (e.g. urgent bugfixes) before shipping it as the default version. This page explains how to upgrade/downgrade to/from this candidate version.

Warning: This is a specific procedure. You should know what you are doing.

Upgrade to candidate version

Warning: This will upgrade your asterisk version and trigger a *restart* of asterisk. You should know what you are doing.

1. Edit the xivo sources list file /etc/apt/sources.list.d/xivo-dist.list and add the xivo-VERSION-candidate distribution (see last line entry below):

```
# xivo-2017.03-latest
deb http://mirror.xivo.solutions/archive/ xivo-VERSION-latest main
# deb-src http://mirror.xivo.solutions/archive/ xivo-VERSION-latest main
deb http://mirror.xivo.solutions/archive/ xivo-VERSION-candidate main
```

2. Update the packages list:

```
apt-get update
```

3. Check the proposed versions with apt-cache policy asterisk. For example it will give you the following result:

4. Install the new version (install also asterisk-dbg package if applicable):

apt-get -t xivo-VERSION-candidate install asterisk

5. Restart the services (if you have a XiVO CC, you should restart its services too):

```
xivo-service restart
```

Note: The priority will prevent installing asterisk from xivo-VERSION-candidate whenever running aptget upgrade or xivo-upgrade.

Downgrade to oldstable version

Warning: This will downgrade your asterisk version and trigger a *restart* of asterisk. You should know what you are doing.

1. Edit the xivo sources list file /etc/apt/sources.list.d/xivo-dist.list and add the xivo-VERSION-oldstable distribution (see last line entry below):

```
# xivo-2017.03-latest
deb http://mirror.xivo.solutions/archive/ xivo-2017.03-latest main
# deb-src http://mirror.xivo.solutions/archive/ xivo-2017.03-latest main
deb http://mirror.xivo.solutions/archive/ xivo-2017.03-oldstable main
```

2. Update the sources list:

apt-get update

3. Check the proposed versions with apt-cache policy asterisk. For example it will give you the following result:

```
# apt-cache policy asterisk
asterisk:
    Installed: 8:13.13.1-1~xivo9+20170321.130355.9ad94c7
    Candidate: 8:13.13.1-1~xivo9+20170321.130355.9ad94c7
    Version table:
    *** 8:13.13.1-1~xivo9+20170321.130355.9ad94c7 1
        100 http://mirror.xivo.solutions/archive/ xivo-2017.03-latest/main amd64_
        →Packages
        8:13.10.0-1~xivo9+2017.01+master+20170208.085934.3b143b7 0
        1 http://mirror.xivo.solutions/archive/ xivo-2017.03-oldstable/main_
        →amd64 Packages
```

4. And downgrade the version by giving the version in the **oldstable** distribution of the repository. With the example below (do the same with asterisk-dbg if applicable):

```
apt-get install asterisk='8:13.10.0-1~xivo9+2017.01+master+20170208.085934.

→3b143b7'
```

5. Restart the services (if you have a XiVO CC, you should restart its services too):

xivo-service restart

Return to the current version

Warning: This will return your asterisk version to the current most stable version and trigger a *restart* of asterisk. You should know what you are doing.

1. Change the source lists with xivo-VERSION-latest:

```
xivo-dist xivo-2017.03-latest
```

2. Check the proposed versions with apt-cache policy asterisk. For example it will give you the following result:

```
# apt-cache policy asterisk
asterisk:
    Installed: 8:13.10.0-1~xivo9+2017.02+master+20170301.144142.3b143b7
    Candidate: 8:13.13.1-1~xivo9+20170321.182632.9ad94c7
    Version table:
        8:13.13.1-1~xivo9+20170321.182632.9ad94c7 0
        500 http://mirror.xivo.solutions/archive/ xivo-2017.03-latest/main_
        →amd64 Packages
   *** 8:13.10.0-1~xivo9+2017.02+master+20170301.144142.3b143b7 0
        100 /var/lib/dpkg/status
```

3. And install the version. With the example below (do the same with asterisk-dbg if applicable):

apt-get install asterisk

4. Restart the services (if you have a XiVO CC, you should restart its services too):

xivo-service restart

XiVOCC Recording upgrade procedure

Note: Since 2017.03.02, xivo-recording and call-recording-filtering packages are deprecated and are replaced by package xivocc-recording. This page describe the upgrade procedure (for *feature description, see here*).

xivo-recording and call-recording-filtering packages are deprecated, but they were not uninstalled from your XiVO PBX during the upgrade.

You now have to follow this manual procedure:

Note: This has to be done on XiVO PBX

1. Install new xivocc-recording package:

apt-get install xivocc-recording

2. Configure xivocc-recording package (when ask, take care to enter same IP for Recording server and same *XiVO PBX* name as in previous configuration):

xivocc-recording-config

- 3. Update all the different locations where the old xivo-incall-recording or xivo-outcall-recording subroutines were called and change them to now call the new xivocc-incall-recording or xivocc-outcall-recording subroutines:
 - (a) either in file /etc/xivo/asterisk/xivo_globals.conf
 - (b) or in Custom dialplan

- 4. If you made specific recording subroutines you should also compare files /etc/ asterisk/extensions_extra.d/xivo-recording.conf and /etc/asterisk/ extensions_extra.d/xivocc-recording.conf and transfer all custom changes to the new xivocc-recording.conf.
- 5. If there are some audio files in the failed directory of previous installation you should move them:

mv /var/spool/xivo-recording/failed/*.wav /var/spool/xivocc-recording/failed/

- 6. When you're done test that recording still works. Test that files are recorded, correctly sent to Recording server (see /var/log/xivocc-recording/replication.log), correctly displayed in the Recording server interface,
- 7. If it works correctly, you should remove deprecated packages with (**take care**, it will remove the package and all associated configuration files):

apt-get purge xivo-recording call-recording-filtering

Version-specific upgrade procedures

Note: If your XiVO PBX is below 2016.03 you have first to Switch to xivo.solutions mirrors.

Switch to xivo.solutions

Note: If you are in XiVO PBX below 2016.03 you should first switch to xivo.solutions mirrors.

In order to do that follow the following procedure:

1. Download the switch-to-xivo-solutions script:

2. Execute the script:

```
./switch-to-xivo-solutions.sh
...
Your XiVO has been switched to xivo.solutions successfully.
Votre XiVO a été basculé vers xivo.solutions avec succès.
```

3. Update the sources list:

apt-get update

Other Version Specific Procedures

Several version specific procedure are listed here.

Upgrading from XiVO 14.11 and before

When upgrading from XiVO 14.11 or earlier, you must do the following, before the normal upgrade:

```
sed -i 's/xivo\.fr/xivo.solutions/g' /etc/apt/sources.list.d/*.list
```

Upgrading from XiVO 14.01, 14.02, 14.03, 14.04 installed from the ISO

In those versions, xivo-upgrade keeps XiVO on the same version. You must do the following, before the normal upgrade:

Upgrading from XiVO 13.24 and before

When upgrading from XiVO 13.24 or earlier, you must do the following, before the normal upgrade:

1. Ensure that the file /etc/apt/sources.list is *not* configured on archive.debian.org. Instead, it must be configured with a non-archive mirror, but still on the squeeze distribution, even if it is not present on this mirror. For example:

deb http://ftp.us.debian.org/debian squeeze main

2. Add archive.debian.org in another file:

```
cat > /etc/apt/sources.list.d/squeeze-archive.list <<EOF
deb http://archive.debian.org/debian/ squeeze main
EOF</pre>
```

And after the upgrade:

rm /etc/apt/sources.list.d/squeeze-archive.list

Upgrading from XiVO 13.03 and before

When upgrading from XiVO 13.03 or earlier, you must do the following, before the normal upgrade:

```
wget http://mirror.xivo.solutions/xivo_current.key -0 - | apt-key add -
```

Upgrading from XiVO 12.13 and before

When upgrading from XiVO 12.13 or earlier, you must do the following, before the normal upgrade:

```
apt-get update
apt-get install debian-archive-keyring
```

Upgrading from XiVO 1.2.1 and before

Upgrading from 1.2.0 or 1.2.1 requires a special procedure before executing xivo-upgrade:

apt-get update apt-get install xivo-upgrade /usr/bin/xivo-upgrade

Upgrading to/from an archive version

Upgrade involving archive version of XiVO

Introduction

What is an archive version?

An archive version refers to a XiVO installation whose version is frozen: you can't upgrade it until you manually change the upgrade server.

What is the point?

Using archive versions enable you to upgrade your XiVO to a specific version, in case you don't want to upgrade to the latest (which is not recommended, but sometimes necessary). You will then be able to upgrade your newer archive version to the latest version or to an even newer archive version.

Prerequisites

Warning: These procedures are *complementary* to the upgrade procedure listed in *Version-specific upgrade procedures*. You must follow the version-specific procedure *before* running the following procedures.

Archive package names

Archive packages are named as follow:

| XiVO version | Archive package name |
|----------------|-----------------------------|
| 1.2 to 1.2.12 | pf-fai-xivo-1.2-skaro-1.2.1 |
| 12.14 to 13.24 | xivo-fai-skaro-13.04 |
| 13.25 to 14.17 | xivo-fai-14.06 |
| 14.18+ | packages removed |

Upgrade from an archive to the latest version

Archive version < 13.25:

```
apt-get update
apt-get install {xivo-fai,xivo-fai-skaro}/squeeze-xivo-skaro-$(cat /usr/share/pf-
→xivo/XIVO-VERSION)
sed -i 's/xivo\.fr/xivo.solutions/g' /etc/apt/sources.list.d/*.list
xivo-upgrade
```

Archive version >= 13.25 and < 14.18:

```
apt-get update
apt-get install xivo-fai
sed -i 's/xivo\.fr/xivo.solutions/g' /etc/apt/sources.list.d/*.list
xivo-upgrade
```

Archive version >= 14.18:

xivo-dist xivo-five xivo-upgrade

As a result, xivo-upgrade will upgrade XiVO to the latest stable version.

Upgrade from an older non-archive version to a newer archive version

Non-archive version means any "normal" way of installing XiVO (ISO install, script install over pre-installed Debian, xivo-upgrade).

Downgrades are not supported: you can only upgrade to a greater version.

We only support upgrades to archive versions \geq 13.25, e.g. you can upgrade a 12.16 to 14.16, but not 12.16 to 13.16

Current version before 14.18 (here 13.25)

```
apt-get install xivo-fai-13.25
sed -i 's/xivo\.fr/xivo.solutions/g' /etc/apt/sources.list.d/*.list
```

You are now considered in an archived version, see the section *Upgrade from an older archive version to a newer archive version* below.

Current version after 14.18

```
xivo-dist xivo-15.12
apt-get update
apt-get install xivo-upgrade/xivo-15.12
xivo-upgrade
```

Upgrade from an older archive version to a newer archive version

Downgrades are not supported: you can only upgrade to a greater version.

We only support upgrades to archive versions \geq 13.25, e.g. you can upgrade a 12.16 to 14.16, but not 12.16 to 13.16

1.2 - 13.24 to 13.25 - 14.17 (here 1.2.3 to 14.16)

```
cat > /etc/apt/sources.list.d/squeeze-archive.list <<EOF
deb http://archive.debian.org/debian/ squeeze main
EOF
apt-get update

Upgrade Notes

See Release Notes for version specific informations.

3.2 XiVOcc Installation & Upgrade

The XiVO-CC software suite is made of several independent components. Depending on your system size, they can be installed on separate virtual or physical machines. In this section, we will explain how to install these components on a single machine.

Important: Before installing XiVO CC, study carefully the Architecture & Flows diagram.

3.2.1 Installation

This page describes how to install the XiVO CC.

It describes the installation with the debian package of the whole XiVO CC.

Note: As a reference, the manual installation page is here Manual configuration and installation.

Warning:

- the wizard MUST be passed on the XiVO PBX
- *XiVO PBX* will be reconfigured during the installation and must be restarted. You may accept the automatic restart during the installation or you need to restart it manually later before starting the docker containers.
- If you configure HA on XiVO, you have to re-configure postgres to accept connection of XiVO CC see *PostgreSQL configuration section*

Overview

The following components will be installed :

- XuC : outsourced CTI server providing telephony events, statistics and commands through a WebSocket
- XuC Management : supervision web pages based on the XuC
- Pack Reporting : statistic summaries stored in a PostgreSQL database
- Totem Support : near-real time statistics based on ElasticSearch
- · SpagoBI : BI suite with default statistic reports based on the Pack Reporting
- Recording Server : web server allowing to search recorded conversations

• Xuc Rights Management : permission provider used by XuC and Recording Server to manage the user rights

Prerequisites

We will assume your XiVO CC server meets the following requirements:

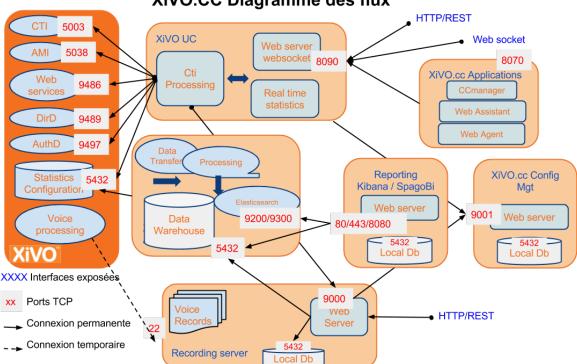

- OS : Debian 8 (jessie), 64 bits.
- you have a *XiVO PBX* installed in a compatible version (basically the two components XiVO and *XiVO CC* have to be in the *same* version).
- the *XiVO PBX* is reachable on the network (ping and ssh between *XiVO CC* and *XiVO PBX* must be possible).
- the *XiVO PBX* is setup (wizard must be passed) with users, queues and agents, you must be able to place and answer calls.

For the rest of this page, we will make the following assumptions :

- the XiVO PBX has the IP 192.168.0.1
- some data (incoming calls, internal calls etc.) might be available on XiVO (otherwise, you will not see *anything* in the *check-list* below).
- the XiVO CC server has the IP 192.168.0.2

Architecture & Flows

This diagram is very important and shows the architecture between the different components inside XiVO CC and also interactions with XiVO PBX components.

XiVO.CC Diagramme des flux

XiVO PBX Restrictions and Limitations

XiVO PBX enables a wide range of configuration, XiVO-CC is tested and validated with a number of restriction concerning configurations of *XiVO PBX*:

General Configuration

- Do not activate Contexts Separation in xivo-ctid Configuration
- Users deactivation is not supported

Queue Configuration

- Queue ringing strategy should not be *Ring All*
- Do not use pause on one queue or a subset of queues status, only pause or ready on all queues
- Do not activate Call a member already on (Asterisk ringinuse) on xivo queue advanced configuration

User And Agent Configuration

- All users and queues have to be in the same context
- Agent and Supervisors profiles should use the same Presence Group
- Agents and Phones should be in the same context for mobile agents
- Agents must not have a password in XiVO agent configuration page
- All users must have the supervision on the XiVO (IPBX-Users-Edit-Services-Enable supervision checked)
- When and agent is disassociated from its user, xuc server has to be restarted.
- We strongly advise to not delete any user or agent to keep reporting available for them. Even so when an agent is deleted, xuc server has to be restarted,

Install from repository

The installation and configuration of *XiVO CC* (with its *XiVO PBX* part) is handled by the *xivocc-installer* package which is available in the repository.

Install process overview

The install process consists of three parts:

- 1. The first part is to manually run the install-docker.sh script to install docker and docker compose.
- 2. The second part is the installation of XiVO CC itself.
- 3. The third part is to install the extra package for the recording.

The installation is automatic and you will be asked few questions during the process:

- Before copying the authentication keys, you will be prompted for the XiVO PBX root password.
- Enter IP addresses of XiVO PBX and XiVO CC.
- XiVO PBX must restart, the question will prompt you to restart during the process or to restart later.

Install Docker and Docker Compose

Note: To be run on the *XiVO CC* server

On a fresh debian install you will probably need to install the ca-certificates package:

apt-get install ca-certificates

Now you can download the script which will install docker and docker compose.

1. First, download the *install-docker.sh* script (in the following URL, replace **VERSION.SUBVERSION** with the current version, e.g. 2017.11.00):

2. And execute the script:

chmod +x install-docker.sh
./install-docker.sh

Install ntp server

Note: To be run on the XiVO CC server

The XiVO CC server and the XiVO PBX server must be synchronized to the same NTP source.

apt-get install ntp

Recommended configuration : you should configure the NTP server of the *XiVO CC* server towards the *XiVO PBX*. In our example it means to add the following line in the file */etc/ntp.conf*:

server 192.168.0.1 iburst

Install XiVO CC

Note: To be run on the XiVO CC server

This step will install the *XiVO CC* components via the xivocc-installer package. It is required to restart *XiVO PBX* during or after the setup process. The installer will ask whether you wish to restart *XiVO PBX* later.

Warning:

- · This package must be installed on the XivoCC server.
- Wizard **MUST** be passed on the *XiVO PBX*.
- XiVO PBX services will need to be restarted. The installer will ask whether you wish to restart XiVO PBX during or after the setup process.

Also, check that you have following information:

• XiVO PBX root password;

- OpenSSH PermitRootLogin set to yes (you could revert to no after installation of XivoCC);
- XiVO PBX's IP address;
- XiVO CC DNS name or IP address (the one visible by XiVO PBX);
- Number of weeks to keep statistics;
- Number of weeks to keep recordings (beware of space disk);

Install the *xivocc-installer* package via *apt*:

1. Create the xivo sources list file /etc/apt/sources.list.d/xivo-dist.list and add the following line (replace **VERSION** with the current version, e.g. 2017.11):

```
deb http://mirror.xivo.solutions/archive/ xivo-VERSION-latest main
```

2. Add GPG key of XiVO repository:

```
wget http://mirror.xivo.solutions/xivo_current.key -0 - | apt-key add -
```

3. Update your source list and install the package:

```
apt-get update
apt-get install xivocc-installer
```

After-install steps

After a successful installation, start docker containers using the installed xivocc-dcomp script:

xivocc-dcomp up -d

If you choose to restart *XiVO PBX* later, please do so as soon as possible to apply the modifications made by the installer. Until then, the *XiVO CC* server will not be able to connect correctly to the database on *XiVO PBX*.

Note: Please, ensure your server date is correct before starting. If system date differs too much from correct date, you may get an authentication error preventing download of the docker images.

To restart XiVO services, on XiVO PBX server run

xivo-service restart all

Reinstallation

To reinstall the package, it is required to run apt-get purge xivocc-installer then apt-get install xivocc-installer. This will re-run the configuration of the package, download the docker compose template and setup *XiVO PBX*.

Purging the package will also **remove** the *xuc* and *stats* users from the *XiVO PBX* database.

Known Issues

To avoid uninstallation problems:

- please use the following command to uninstall apt-get purge xivocc-installer
- if the process is aborted, it will break the installation. Then run apt-get purge and apt-get install again

Checking Installed Version

Version of the running docker containers can be displayed by typing (see *Show containers and images versions* for other commands):

xivocc-dcomp version

Component version can also be found in the log files and on the web pages for web components.

Using XivoCC

The various applications are available on the following addresses:

- Xuc-related applications: http://192.168.0.2:8070/
- SpagoBI: http://192.168.0.2:9500/
- Config Management: http://192.168.0.2:9100/
- Recording server: http://192.168.0.2:9400/
- Kibana: http://192.168.0.2/

Post Installation

User Configuration

You should configure users and their rights in the Configuration manager http://192.168.0.2:9100/ (default user avencall/superpass).

Warning: If you change the cti login username in xivo configuration, user has to be recreated with apropriate rights in configuration manager.

SpagoBl

To configure SpagoBI, go to http://192.168.0.2:9500/SpagoBI (by default login: biadmin, password: biadmin).

Update default language

- 1. Go to "Resources" > "Configuration management"
- 2. In the "Select Category" field, chose "LANGUAGE_SUPPORTED"
- 3. change value of the label "SPAGOBI.LANGUAGE_SUPPORTED.LANGUAGE.default" in your language : fr,FR , en,US , ...

Upload Sample Reports

- 1. Download the sample reports from https://gitlab.com/xivocc/sample_reports/blob/master/spagobi/ samplereports.zip
- 2. Import zip file in SpagoBI:
 - 1. Goto "Repository Management" -> "Import/Export"
 - 2. Click on "Browse/Choose your file" and choose the previous samplereports.zip downloaded file
 - 3. Click on "Import" icon
 - 4. Click next with default options until you are asked to override metadata, set **Yes** as shown in screen below

| Ħ | Meta-data conflicts |
|------------|---|
| | Overwrite the existing meta-data with the exported one?: Yes v |
| • | List of values |
| Q | Exported list of values files |
| | files files |
| <u>果</u> . | THE5 |
| ~ | maintenant maintenant |
| | |

You can now browse the sample reports in *Document->Rapports->Exemples*.

Use the database status report to check if replication and reporting generation is working :

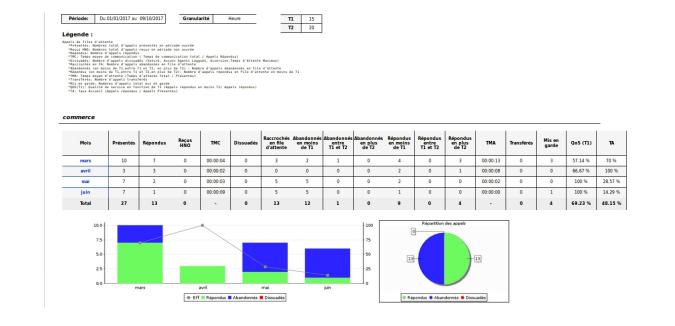

Totem Panels

Data replication can take some time if there are a lot of data in xivo cel and queue log tables. You may check xivo-db-replication log files (/var/log/xivocc/xivo-db-replication.log).

Preconfigured panels are available on http://@IP/kibana/#/dashboard/file/queues.json et http://@IP/kibana/#/ dashboard/file/agents.json to be able to save this panels in elasticsearch database you have to sign on on request user admin/Kibana

Post Installation Check List

- All components are running : xivocc-dcomp ps
- Xuc internal database is synchronized with xivo check status page with http://xivoccserver:8090/

answered

answered

- CCManager is running, log a user and check if you can see and manage queues : http://xivoccserver: 8070/ccmanager
- Check database replication status using spagobi system report http://xivoccserver:9500/SpagoBI
- Check elasticsearch database status (totem panels) http://xivoccserver:9200/queuelogs/_status
- Check that you can listen to recordings http://xivoccserver:9400/
- Check totem panels http://192.168.85.102/kibana

Warning: Make sure to have few calls made in your XiVO, despite you will not see **anything** in totem or spagobi.

Recording

Note: To be run on the XiVO PBX server

Warning: Since 2017.03.02 xivo-recording and call-recording-filtering packages are deprecated and are replaced by package xivocc-recording. In case of upgrade, see *XiVO PBX* specific upgrade procedure: *XiVOCC Recording upgrade procedure*.

Install on your XiVO PBX the debian package available in the repository.

apt-get install xivocc-recording

This package needs additional configuration steps, see:

1. Recording configuration,

2. and (optionally) Recording filtering configuration.

Recording on a Gateway

If you don't want to record files on the XiVO PBX itself but on a XiVO PBX Gateway, you must install the gateway-recording package (instead of the xivocc-recording):

apt-get install gateway-recording

For configuration of this package, see Gateway recording configuration.

3.2.2 Components Configuration

Important: When reading this section, keep in mind the Architecture & Flows diagram.

Overview

This section describes files installed by *xivocc-installer*. Some of these files may be modified for these reasons:

- Components customization
- Multi-server installation

XiVO CC system configuration is stored in the /etc/docker/compose directory. All files ale configured by the *xivocc-installer* and don't need to be edited. The directory contains these files:

- docker-xivocc.yml, called *compose file*, defines XiVO CC components and their configuration. It uses variables defined in the .env file.
- .env file assigns values to variables used in the *compose file*. But this file is being generated by *xivocc-dcomp* script and **should not be edited directly**.
- factory.env file stores XiVO CC version number and distribution and should not be edited.
- custom.env file may be used for component customization and multi-server installation.

Compose File

docker-xivocc.yml

Sections

- The main headers in the compose file (without indent) are container names.
- image links to container image url on https://hub.docker.com/r/ page.
- ports exposes container internal ports to host in format HOST:CONTAINER.
- volumes_from mounts all of the volumes from another container
- environment adds environment variables into container system
- extra_hosts adds host address to /etc/hosts
- links adds another container's host address to /etc/hosts

See detailed documentation on docker web.

Variables

Compose file contains more kinds of variables:

- Variable in the environment section without assignment is replaced by the same variable from .env file. If it's not defined or assigned in the .env file, it doesn't appear in the container system.
- Variable in the environment section with assigned value overrides value defined in the .env file.
- Variable defined in the links section can be assigned to variable in the environment section.
- Variable inside \${ } block is replaced by value defined in .env file and can be used anywhere.

Variables in the factory.env file

This file should not be edited. XiVO CC version matches version of xivocc-installer and the other distributions are only for testing purposes.

- XIVOCC_TAG XiVO CC version number
- XIVOCC_DIST XiVO CC distribution

Variables in the custom.env file

All variables listed below can be edited or added to this file. But variables which are assigned inside compose file must be first unassigned from there.

List of variables shared across containers

Main components addresses and ports:

- XIVO_HOST
- XUC_HOST
- XUC_PORT

Customizable addresses and ports for multi-server installation:

- CONFIG_MGT_HOST
- CONFIG_MGT_PORT
- RECORDING_SERVER_HOST
- RECORDING_SERVER_PORT

Other:

• JAVA_OPTS - allocates Java memory and sets other Java options. If you want to use different values for containers, they must be assigned inside compose file. Or you can define new variable for this purpose - e.g.: JAVA_OPTS=JAVA_OPTS_XUC and set the value in the custom.env file.

List of docker containers and their variables

- pgxivocc
 - POSTGRES_PASSWORD
- postgresvols
- xivo_replic
 - ELASTICTTL

- DISABLEELASTIC
- xivo_stats
- pack_reporting
 - WEEKS_TO_KEEP
- elasticsearch
- kibana_volumes
- fingerboard
- nginx
- spagobi
- recording_rsync
- config_mgt
- recording_server
 - RECORDING_WEEKS_TO_KEEP
- xuc
 - XIVO_AMI_SECRET
 - XIVO_AMI_PORT
 - XIVO_CTI_VERSION
 - API_eventUrl
 - XIVO_DIRD_PROFILE
 - SECURED_KRB5_PRINCIPAL
- xucmgt
 - SHOW_RECORDING_CONTROLS
 - SHOW_CALLBACKS
 - SHOW_QUEUE_CONTROLS
 - THIRD_PARTY_URL
 - ENFORCE_MANAGER_SECURITY
 - USE_SSO
- timezone
- xivocclogs

3.2.3 Phone Integration

XUC based web applications like agent interface or UC Assistant integrates buttons for phone control. This section details necessary configuration, supported phones and limitations.

Note: The VoIP VLAN network have to be accessible by the xivocc xuc server

Required configuration

The following steps are not required if you updated the Provisioning plugins.

Polycom phones

Warning: This is required only for plugins:

- xivo-polycom-4.0.9 version below v1.9
- xivo-polycom-5.4.3 version below v1.8

To enable phone control buttons on web interfaces you must update the basic template of Polycom phones:

- go to the plugin directory: /var/lib/xivo-provd/plugins/xivo-polycom-VERSION
- copy the default template from *templates/base.tpl* to *var/templates/*
- then you must update *app.push* parameters in the else section (**do not replace switchboard settings**) as follows:

```
apps.push.messageType="5"
apps.push.username="guest"
apps.push.password="guest"
```

Snom phones

For transfer to work on Polaris version you must have plugins with version v2.2 or above.

Yealink phones

Warning: This is required only for plugins xivo-yealink-v80 below v1.31

To enable phone control buttons on web interfaces you must update the basic template of Yealink phones:

- go to the plugin directory: /var/lib/xivo-provd/plugins/xivo-yealink-VERSION
- copy the default template from *templates/base.tpl* to *var/templates/*
- enable sip notify even for non switchboard profiles (do not replace switchboard settings)

```
{% if XX_options['switchboard'] -%}
push_xml.sip_notify = 1
call_waiting.enable = 0
{% else -%}
push_xml.sip_notify = 1
call_waiting.enable = 1
{% endif %}
```

Update Device Configuration

- to update device configuration you must run **xivo-provd-cli -c 'devices**. using_plugin("xivo-polycom-VERSION").reconfigure()'
- and finally you must resynchronize the device: **xivo-provd-cli -c 'devices**. using_plugin("xivo-polycom-VERSION").synchronize()'
- refer to provisioning documentation for more details
- if the phone synchronization fails check if the phone uses the version of the plugin you have updated, you can use **xivo-provd-cli -c** 'devices.find() '

Known limitations

Phone integration with Agent and Web / Desktop application has these limitations:

Transfer

- If the second call was initiated from Agent / Assistant and the called user rejected the call, the first call will stay hold until it is manually resumed
- If the second call was initiated from the phone, the transfer must be also completed from the phone. It can't be completed from Agent / Assistant.
- You cannot complete a transfer initiated from the Agent / Assistant by hanging up.

Conference with Yealink / Polycom

• Conference can't be created from Agent or Web / Desktop Assistant

3.2.4 XiVOcc Installation Troubleshooting

In order for the XiVOcc components to be fully functional, some customizations need to be done on the XiVOcc and the XiVO PBX.

This page can help to check that all the correct customization have been done by the installation package.

For the rest of this page we well make the following assumptions: - XiVO PBX has the IP 192.168.0.1 - XiVO CC has the IP 192.168.0.2

Important: Refer to the Architecture & Flows diagram.

Check XiVOcc Configuration

Check the prerequisites

- the OS must be Debian 8 (jessie), 64 bit,
- Docker must be installed,
- Docker-compose must be installed,
- the XiVO PBX must be reachable on the network.

Check ntp installation

The XiVO CC server and the XiVO server must be synchronized to the same source NTP source.

Check Logrotate configuration

A file /etc/logrotate.hourly/docker-container must be present which should log rotate files / var/lib/docker/containers/*/*.log

You can test it with logrotate -fv /etc/logrotate.hourly/docker-container. You should get some output and a new log file with suffix [CONTAINER ID]-json.log.1 should be created. This file is compressed in next rotation cycle.

Check Docker compose

• No alias for docker-compose should be defined. The following command should return "OK":

alias |grep -E 'docker-compose|dcomp' || echo "OK"

• The version of the docker images in the file /etc/docker/compose/docker-xivocc.yml must be in the form \${XIVOCC_TAG}.\${XIVOCC_DIST} and these variables must be set in the /etc/ docker/compose/factory.env file:

```
xivo_stats:
    image: xivoxc/xivo-full-stats:${XIVOCC_TAG}.${XIVOCC_DIST}
...
xuc:
    image: xivoxc/xuc:${XIVOCC_TAG}.${XIVOCC_DIST}
...
```

Check the services

The list of the services launched should look like :

| # xivocc-dcomp ps Name → Ports | Command | State | |
|--|---|--------|---------------|
| ↔ xivocc_config_mgt_1 | bin/config-mgt-docker | Up | 0.0.0.0:9100- |
| ↔>9000/tcp | | - I- | |
| xivocc_elasticsearch_1 →>9200/tcp, 0.0.0.0:9300-> | /docker-entrypoint.sh elas >9300/tcp | Up | 0.0.0.0:9200- |
| xivocc_fingerboard_1 | /bin/sh -c /usr/bin/tail | Up | |
| xivocc_kibana_volumes_1 | /bin/sh -c /usr/bin/tail | Up | |
| xivocc_nginx_1 →0.0:80->80/tcp | nginx -g daemon off; | Up | 443/tcp, 0.0. |
| <pre>xivocc_pack_reporting_1</pre> | /bin/sh -c echo | Up | |
| xivocc_pgxivocc_1 →>5432/tcp | /docker-entrypoint.sh postgres | Up | 0.0.0.0:5443- |
| xivocc_postgresvols_1 | /bin/bash | Exit O | |
| <pre>xivocc_recording_server_1</pre> | bin/recording-server-docker | Up | 0.0.0.0:9400- |
| <pre>xivocc_reporting_rsync_1</pre> | /usr/local/sbin/run-rsync.sh | Up | 0.0.0.0:873-> |
| xivocc_spagobi_1 →>8080/tcp | /bin/sh -c /root/start.sh | Up | 0.0.0.0:9500- |
| xivocc_timezone_1 | /bin/bash | Exit O | |
| xivocc_xivo_replic_1 | /usr/local/bin/start.sh /o | Up | |
| xivocc_xivo_stats_1 | /usr/local/bin/start.sh /o | Up | |
| xivocc_xivocclogs_1 | /bin/bash | Exit O | |
| xivocc_xuc_1 →>9000/tcp | bin/xuc_docker | Up | 0.0.0.0:8090- |
| xivocc_xucmgt_1 →>9000/tcp | bin/xucmgt_docker | Up | 0.0.0.0:8070- |

Check the XiVO PBX

Check PostgreSQL configuration

- Postgresql has to be configured to listen on all interfaces. See *listen_addresses* in file /etc/ postgresql/9.4/main/postgresql.conf.
- Connection from the XiVO CC for user asterisk must be authorized. See file /etc/postgresql/9.1/ main/pg_hba.conf which must contain a line:

host asterisk all 192.168.0.2/32 md5

• A user *stats* must exists. Use command \dg in psql.

Check AMI configuration

- A *xuc* user must be configured in the file /etc/asterisk/manager.d/02-xivocc.conf
- The command:

asterisk -rx "manager show user xuc"

must show the user.

CEL Configuration

The correct events must be activated in the file /etc/asterisk/cel.conf:

Check CTI configuration

In Services \rightarrow IPBX \rightarrow Users a user the must be created with the following parameters:

- CTI login : xuc
- CTI password : 0000
- · Profile supervisor

Check WS configuration

In Configuration \rightarrow Web Services Access a user must be created with the following parameters :

- Login : xivows
- Password : xivows
- Host : 192.168.0.2

Check ACD configuration

In Services \rightarrow Ipbx \rightarrow Advanced configuration make sure Multiqueues call stats sharing is checked.

Check the phone integration

Verify that the phone configuration where customized as detailed in Required configuration for phone integration.

Check the recording

The package xivocc-recording must be installed on XiVO PBX (see *Recording*) and configured (see *Recording configuration*).

For specific installations

3.2.5 Manual configuration and installation

This section describes the manual installation of the XiVO CC components. In most cases you **SHOULD NOT** follow this page, and install the XiVO CC components via the *xivocc-installer* package (see *Installation*).

Important: You SHOULD NOT follow this page to install XiVO CC. We leave this page here :

- to document how to install only a subset of the XiVO CC components (since it is not currently possible via the *xivocc-installer* package).
- to help with reconfiguring XiVO for XiVO CC after it has been restored from backup
- as a reference

Note: Since XiVO PBX 2017.06 some parts of the installation were moved from *xivocc-installer* to installation of XiVO PBX.

Prerequisites

We will assume your XiVO CC server meets the following requirements:

- OS : Debian 8 (jessie), 64 bit
- the latest stable version of Docker is installed
- the latest stable version of Docker-compose is installed
- the XiVO PBX is reachable on the network
- the XiVO PBX is setup with users, queues and agents, you must be able to place and answer calls.

Note : Install only stable version of docker and docker compose.

We will make the following assumptions :

- the XiVO PBX has the IP 192.168.0.1
- some data (incoming calls, internal calls etc.) might be available on XiVO (otherwise, you will not see *anything* in the *Post Installation Check List*).
- the *XiVO CC* server has the IP 192.168.0.2

XiVO PBX configuration

PostgreSQL configuration

Firstly, allow access to PostgreSQL from the outside. Edit /etc/postgresql/9.4/main/postgresql. conf:

listen_addresses = '*'

Add this line to /etc/postgresql/9.4/main/pg_hba.conf:

```
host asterisk all 192.168.0.2/32 md5
```

Create a user *stats* with read permissions :

```
sudo -u postgres psql asterisk << EOF
CREATE USER stats WITH PASSWORD 'stats';
GRANT SELECT ON ALL TABLES IN SCHEMA PUBLIC TO stats;
EOF
```

And run xivo-service restart all to apply these modifications.

AMI configuration

• Add file /etc/asterisk/manager.d/02-xivocc.conf directory with the following content, replacing *X.X.X.X* by your xucserver IP address :

```
[xuc]
secret = xucpass
deny=0.0.0.0/0.0.0.0
permit=X.X.X.X/255.255.255
read = system,call,log,verbose,command,agent,user,dtmf,originate,dialplan
write = system,call,log,verbose,command,agent,user,dtmf,originate,dialplan
writetimeout = 10000
```

• And reload the AMI :

```
asterisk -rx "manager reload"
asterisk -rx "manager show user xuc" and check your if previous configuration is_
→displayed.
```

CEL Configuration

• Replace content of file /etc/asterisk/cel.conf by the following :

• and reload the cel module in Asterisk :

```
asterisk -rx "module reload cel"
```

Customizations in the web interface

- Create a user *xuc* in *Services -> IPBX -> Users* with the following parameters:
- CTI login : xuc
- CTI password : 0000
- profil supervisor
- Create a Web Services user in *Configuration -> Web Services Access* with the following parameters :
- Login : xivows
- Password : xivows
- Host : 192.168.0.2

Make sure Multiqueues call stats sharing is enabled in Services -> IPBX -> Advanced configuration tab.

Phone integration

Do not forget to follow configuration steps detailed in Required configuration for phone integration.

Packages for the recording

Still on the *XiVO PBX*, install the package which will handle the recording. See *Recording paragraph* in installation section.

XiVO CC configuration

Now we switch to the installation of the XiVO CC server.

Install ntp server

apt-get install ntp

XiVO CC server and XiVO PBX server must be synchronized to the same source.

Enable Docker LogRotate

Docker container log output to /dev/stdout and /dev/stderr. The Docker container log file is saved in /var/lib/docker/containers/[CONTAINER ID]/[CONTAINER_ID]-json.log.

Create a new Logrotate config file for your Docker containers in the Logrotate folder /etc/logrotate.d/dockercontainer.

```
/var/lib/docker/containers/*/*.log {
  rotate 7
  daily
  compress
  missingok
  delaycompress
  copytruncate
}
```

You can test it with logrotate -fv /etc/logrotate.d/docker-container. You should get some output and a new log file with suffix [CONTAINER ID]-json.log.1 should be created. This file is compressed in next rotation cycle.

Retrieve the configuration script and launch it:

Containers installation

During the installation, you will be asked for :

- the XiVO IP address (e.g. 192.168.0.1)
- the number of weeks to keep for the statistics
- the number of weeks to keep for the recording files
- the external IP of the machine (i.e. the adress used afterwards for http URLs)

Create the following alias in your .bashrc file:

```
vi ~/.bashrc
alias dcomp='docker-compose -p xivocc -f /etc/docker/compose/docker-xivocc.yml'
```

Containers modification

The yml file /etc/docker/compose/docker-xivocc.yml should have the correct tag version for each imeage.

Check also that the XIVO_CTI_VERSION is correct for the xuc container.

```
xivo_replic :
 image: xivoxc/xivo-db-replication:2016.03.latest
xivo_stats :
 image: xivoxc/xivo-full-stats:2016.03.latest
pack_reporting:
 image: xivoxc/pack-reporting:2016.03.latest
config mgt:
 image: xivoxc/config-mgt:2016.03.latest
recording_server:
 image: xivoxc/recording-server:2016.03.latest
xuc:
 image: xivoxc/xuc:2016.03.latest
 environment:
  - XIVO_CTI_VERSION=2.1
xucmqt:
 image: xivoxc/xucmgt:2016.03.latest
```

Starting XivoCC

Then you can launch the XiVO CC with the following command :

dcomp up -d

List XivoCC services :

| <i># dcomp ps</i> Name → Ports | Command | State | |
|--|--|--------|---------------|
| | | | |
| xivocc_config_mgt_1 →>9000/tcp | bin/config-mgt-docker | Up | 0.0.0.0:9100- |
| xivocc_elasticsearch_1 →>9200/tcp, 0.0.0.0:9300-> | /docker-entrypoint.sh elas 9300/tcp | Up | 0.0.0.0:9200- |
| xivocc_fingerboard_1 | /bin/sh -c /usr/bin/tail | Up | |
| xivocc_kibana_volumes_1 | /bin/sh -c /usr/bin/tail | Up | |
| xivocc_nginx_1 →0.0:80->80/tcp | nginx -g daemon off; | Up | 443/tcp, 0.0. |
| <pre>xivocc_pack_reporting_1</pre> | /bin/sh -c echo | Up | |
| xivocc_pgxivocc_1 →>5432/tcp | /docker-entrypoint.sh postgres | Up | 0.0.0:5443- |
| xivocc_postgresvols_1 | /bin/bash | Exit O | |
| <pre>xivocc_recording_server_1</pre> | bin/recording-server-docker | Up | 0.0.0.0:9400- |
| xivocc_reporting_rsync_1 →873/tcp | /usr/local/sbin/run-rsync.sh | Up | 0.0.0:873-> |
| xivocc_spagobi_1 →>8080/tcp | /bin/sh -c /root/start.sh | Up | 0.0.0.0:9500- |
| xivocc_timezone_1 | /bin/bash | Exit O | |
| xivocc_xivo_replic_1 | /usr/local/bin/start.sh /o | Up | |
| xivocc_xivo_stats_1 | /usr/local/bin/start.sh /o | Up | |
| xivocc_xivocclogs_1 | /bin/bash | Exit O | |
| xivocc_xuc_1 →>9000/tcp | bin/xuc_docker | Up | 0.0.0.0:8090- |
| xivocc_xucmgt_1 →>9000/tcp | bin/xucmgt_docker | Up | 0.0.0.0:8070- |

Upgrading

3.2.6 Upgrade

Overview

The following components will be upgraded :

- Docker images
- xivocc-installer package

Warning: This upgrade procedure applies only to XiVO CC installed via the xivocc-installer package.

Before upgrading you have to check or change your sources list. It should be located in the file /etc/apt/ sources.list.d/xivo-dist.list.

There are three cases:

- 1. Upgrade to an LTS XiVO CC version,
- 2. Upgrade to an Intermediate version,
- 3. Upgrade to the latest subversion of your current installed version.

Warning: Note that it is not possible to downgrade to any version.

Upgrade to an LTS version

Currently XiVO CC *latest* LTS version is Polaris and is the numeric release 2017.11. To upgrade to the latest version the sources list must point towards *debian* URI and *xivo-polaris* suite:

deb http://mirror.xivo.solutions/debian/ xivo-polaris main

or point towards archive URI and xivo-2017.11-latest suite:

```
deb http://mirror.xivo.solutions/archive/ xivo-2017.11-latest main
```

Upgrade to an Intermediate version

Note: Intermediate versions have a limited support. You should install LTS version only.

Between two LTS versions we release **Intermediate** versions (to which is given a limited support). To upgrade to a *specific* **Intermediate** version the sources list must point towards *archive* URI and *xivo-VERSION-latest* suite.

For example if you want to upgrade to 2017.06 version you should have:

deb http://mirror.xivo.solutions/archive/ xivo-2017.06-latest main

Note the /archive/ and -2017.06-latest above.

Upgrade to latest subversion

Important: For version older than Five (2017.03), see XiVO Five documentation

After the release of a *version* (e.g. 2017.11) we may backport some bugfixes in this version. We will then create a **subversion** (e.g. 2017.11 **.01**) shipping these bugfixes. To upgrade to the **latest subversion** of your current installed *version* you need to:

- 1. Verify that the /etc/docker/compose/factory.env file has
 - (a) XIVOCC_TAG=VERSION (where VERSION is your current installed version e.g. 2017.11)
 - (b) and XIVOCC_DIST=latest
- 2. Then update the images with xivocc-dcomp pull command,
- 3. And upgrade the containers with xivocc-dcomp up -d command.

Preparing the upgrade

To prepare the upgrade you should:

1. Read *Release Notes* starting from your version to the version you target.

Upgrade

When you have checked the sources.list you can upgrade with the following commands:

```
apt-get update
apt-get install xivocc-installer
```

The current docker-compose.yml file will be renamed to docker-compose.yml.dpkg-old and new template downloaded. A new docker-compose.yml file will be rendered from the template using the current xivocc version.

Then you have to:

1. Download the new images:

xivocc-dcomp pull

2. And run the new container (All XiVO CC services will be restarted):

xivocc-dcomp up -d

Note: Please, ensure your server date is correct before starting. If system date differs too much from correct date, you may get an authentication error preventing download of the docker images.

Post Upgrade

Check your upgrade through Post Installation Check List.

Upgrade notes

See Release Notes for version specific informations.

Reporting Upgrade notes

These notes include upgrade procedures for old versions of the **Pack reporting**, before **XivoCC** starts and before it was packaged with Docker. In those cases, run the following command to find the installed version of the pack reporting:

dpkg -l|grep pack-reporting

From version < 1.6

- data retention time will be lost during upgrade : save it and write it back in /etc/xivo-reporting-db.conf
- the upgrade is likely to be long if there is a lot of data in *queue_log*. Purge old data out of this table if possible in order to accelerate the upgrade
- at the end of the upgrade, run apt-get autoremove (deletion of xivo-stat, xivo-libdao and xivo-lib-python)

From version < 1.8

- XiVO in version < 14.08 is not supported anymore
- if it is required, the upgrade of the XiVO must be done before the upgrade of the pack reporting, and no call must be performed between the two upgrades

From a version using Debian packaging to a version using Docker

- **Beware**: this will require a migration of the original PostgreSQL database to the Dockerised one. For this you need to have free disk space : the amount of free disk space must equal the size of */var/lib/postgresql*. This check must be performed after docker images have been pulled.
- Run the following commands:

- Install docker, docker-compose and xivocc-installer
- Open docker-xivocc.yml and remove sections recording_rsync, config_mgt, recording_server, xuc, xucmgt
- Run xivocc-dcomp pull
- CHECK THE FREE DISK SPACE. The next command will migrate the database. This may take several hours.

sudo -u postgres pg_dump --format c xivo_stats | docker exec -i xivocc_pgxivocc_1_ →pg_restore -U postgres -d xivo_stats

• Start by *xivocc-dcomp up -d*

From a dockerized version before callbacks

• Run the following commands:

```
docker exec -ti compose_pgxivocc_1 psql -U postgres -c 'CREATE EXTENSION IF NOT_

→EXISTS "uuid-ossp"' xivo_stats

docker exec -ti compose_pgxivocc_1 psql -U postgres -c 'CREATE EXTENSION IF NOT_

→EXISTS "uuid-ossp"' xuc_rights
```

CHAPTER 4

Administrator's Guide

In-depth documentation on administration of XiVO solution systems.

4.1 XiVO Administration

4.1.1 System

DHCP Server

XiVO includes a DHCP server used for assisting in the provisioning of phones and other devices. (See *Basic Configuration* for the basic setup). This section contains additional notes on how to configure more advanced options that may be helpful when integrating the server with different VOIP subnets.

Activating DHCP on another interface

DHCP Server can be activated through the XiVO Web Interface Configuration \rightarrow Network \rightarrow DHCP :

| DHCP | Active: | |
|------|---------------------------|---|
| | Pool start: |] |
| | Pool end: |] |
| | Extra network interfaces: | 0 |
| SAVE | | |

Fig. 4.1: Configuration \rightarrow Network \rightarrow DHCP

By default, it will only answer to DHCP requests coming from the VoIP subnet (defined in the *Configuration* \rightarrow *Network* \rightarrow *Interfaces* section). If you need to activate DHCP on an other interface, you have to fill in the *Extra network interfaces* field with the interface name, for example : eth0

After saving your modifications, click on Apply system configuration so that the new settings can take effect.

Changing default DHCP gateway

By default, the XiVO DHCP server uses the XiVO's IP address as the routing address. To change this you must create a custom-template:

1. Create a custom template for the dhcpd_subnet.conf.head file:

```
mkdir -p /etc/xivo/custom-templates/dhcp/etc/dhcp/
cd /etc/xivo/custom-templates/dhcp/etc/dhcp/
cp /usr/share/xivo-config/templates/dhcp/etc/dhcp/dhcpd_subnet.conf.head .
```

2. Edit the custom template:

vim dhcpd_subnet.conf.head

3. In the file, replace the string #XIVO_NET4_IP# by the routing address of your VoIP network, for example:

option routers 192.168.2.254;

4. Re-generate the dhcp configuration:

xivo-update-config

DHCP server should have been restarted and should now use the new routing address.

Configuring DHCP server to serve unknown hosts

By default, the XiVO DHCP server serves only known hosts. That is:

- either hosts which MAC address prefix (the OUI) is known
- · or hosts which Vendor Identifier is known

Known OUIs and Vendor Class Identifiers are declared in /etc/dhcp/dhcpd_update/* files.

If you want your XiVO DHCP server to serve also unknown hosts (like PCs) follow these instructions:

1. Create a custom template for the dhcpd_subnet.conf.tail file:

```
mkdir -p /etc/xivo/custom-templates/dhcp/etc/dhcp/
cd /etc/xivo/custom-templates/dhcp/etc/dhcp/
cp /usr/share/xivo-config/templates/dhcp/etc/dhcp/dhcpd_subnet.conf.tail .
```

2. Edit the custom template:

vim dhcpd_subnet.conf.tail

3. And add the following line at the head of the file:

allow unknown-clients;

4. Re-generate the dhcp configuration:

```
xivo-update-config
```

DHCP server should have been restarted and should now serve all network equipments.

DHCP-Relay

If your telephony devices aren't located on the same site and the same broadcast domain as the XiVO DHCP server, you will have to add the option *DHCP Relay* to the site's router. This parameter will allow the DHCP requests from distant devices to be transmitted to the IP address you specify as DHCP Relay.

Warning: Please make sure that the IP address used as DHCP Relay is the same as one of XiVO's interfaces, and that this interface is configured to listen to DHCP requests (as decribed in previous part). Also verify that routing is configured between the distant router and the choosen interface, otherwise DHCP requests will never reach the XiVO server.

Configuring DHCP server for other subnets

This section describes how to configure XiVO to serve other subnets that the VOIP subnet. As you can't use the Web Interface to declare other subnets (for example to address DATA subnet, or a VOIP subnet that isn't on the same site that XiVO server), you'll have to do the following configuration on the Command Line Interface.

Creating "extra subnet" configuration files

First thing to do is to create a directory and to copy into it the configuration files:

```
mkdir /etc/dhcp/dhcpd_sites/
cp /etc/dhcp/dhcpd_subnet.conf /etc/dhcp/dhcpd_sites/dhcpd_siteXXX.conf
cp /etc/dhcp/dhcpd_subnet.conf /etc/dhcp/dhcpd_sites/dhcpd_lanDATA.conf
```

Note: In this case we'll create 2 files for 2 differents subnets. You can change the name of the files, and create as many files as you want in the folder /etc/dhcp/dhcpd_sites/. Just adapt this procedure by changing the name of the file in the different links.

After creating one or several files in /etc/dhcp/dhcpd_sites/, you have to edit the file /etc/dhcp/ dhcpd_extra.conf and add the according include statement like:

```
include "/etc/dhcp/dhcpd_sites/dhcpd_siteXXX.conf";
include "/etc/dhcp/dhcpd_sites/dhcpd_lanDATA.conf";
```

Adjusting Options of the DHCP server

Once you have created the subnet in the DHCP server, you must edit each configuration file (the files in /etc/ dhcp/dhcpd_sites/) and modify the different parameters. In section **subnet**, write the IP subnet and change the following options (underlined fields in the example):

subnet 172.30.8.0 netmask 255.255.255.0 {

• subnet-mask:

option subnet-mask 255.255.255.0;

• broadcast-address:

option broadcast-address 172.30.8.255;

• routers (specify the IP address of the router that will be the default gateway of the site):

option routers 172.30.8.1;

In section **pool**, modify the options:

pool {

• log (add the name of the site or of the subnet):

• range (it will define the range of IP address the DHCP server can use to address the devices of that subnet):

range 172.30.8.10 172.30.8.200;

Warning: XiVO only answers to DHCP requests from *supported devices*. In case of you need to address other equipment, use the option *allow unknown-clients*; in the /etc/dhcp/dhcpd_sites/ files

• If you have checked the "DHCP integration" (See *Advanced Configuration* for the basic setup) in provisionning configuration, you will also **MUST** add the parameter below: (**Otherwise provd won't be able to route the devices to the correct plugins**)

At this point, you can apply the changes of the DHCP server with the command:

service isc-dhcp-server restart

After that, XiVO will start to serve the DHCP requests of the devices located on other sites or other subnets than the VOIP subnet. You will see in /var/log/daemon.log all the DHCP requests received and how they are handled by XiVO.

Mail

This section describes how to configure the mail server shipped with XiVO (Postfix) and the way XiVO handles mails.

In *Configuration* \rightarrow *Network* \rightarrow *Mail*, the following options can be configured:

- Domain Name messaging : the server's displayed domain. Will appear in "Received" mail headers.
- Source address of the server : domain part of headers "Return-Path" and "From".
- *Relay SMTP* and *FallBack relay SMTP* : relay mail servers.
- *Rewriting shipping addresses* : Canonical address Rewriting. See Postfix canonical documentation for more info.

Warning: Postfix, the mail server shipped with XiVO, should be stopped on an installed XiVO with no valid and reachable DNS servers configured. If Postfix is not stopped, messages will bounce in queues and could end up affecting core pbx features.

If you need to disable Postfix here is how you should do it:

```
systemctl stop postfix systemctl disable postfix
```

If you ever need to enable Postfix again:

```
systemctl enable postfix
systemctl start postfix
```

Alternatively, you can empty Postfix's queues by issuging the following commands on the XiVO server:

```
postsuper -d ALL
```

Network

This section describes how to configure additional network devices that may be used to better accomodate more complex network infrastructures. Network interfaces are managed in the XiVO web interface via the page *Configuration* \rightarrow *Network* \rightarrow *Interfaces*.

XiVO offers 2 types of interfaces: *VoIP* and *Data*. The *VoIP* interface is used by the DHCP server, provisioning server, and phone devices connected to your XiVO. These services will use the information provided on the *VoIP* interface for their configuration. For example, the DHCP server will only listen on the VoIP interface by default.

To change these settings, you must either create a new interface or edit an existing one and change its type. When adding a new *VoIP* interface, the type of the old one will automatically be changed to *Data*.

Configuring a physical interface

In this example, we'll add and configure the eth1 network interface on our XiVO.

First, we see there's already an unconfigured network interface named eth1 on our system:

| agement s | | Interface | Mac address | Type | Method | Address | Gateway | Action |
|--------------------------------------|--|-----------------------|-------------------|------|--------|----------------|--------------|--------|
| es ral | | ✓ br-76f3210 | 02:42:6c:13:26:7a | Data | - | 172.18.0.1 | - | |
| tories Services Access | | — docker0 | 02:42:b2:94:75:80 | Data | - | 172.17.0.1 | - | |
| ates vailability | | ✓ eth0 | 1a:e5:c4:98:93:28 | Data | Static | 192.168.85.232 | 192.168.85.1 | 0 |
| ervers | | ✓ veth47d617 | e6:dd:11:46:df:ba | Data | - | - | | |
| work vrfaces solver I CP | Legend Enable | 🛇 Disable 🗕 Not apply | | | | | | |

Fig. 4.2: Configuration \rightarrow Network \rightarrow Interfaces

To add and configure it, we click on the small plus button next to it, and we get to this page:

In our case, since we want to configure this interface with static information (i.e. not via DHCP), we fill the following fields:

Note that since our **eth0** network interface already has a default gateway, we do not enter information in the Default gateway field for our **eth1** interface.

Once the changes have been saved, the action **Apply network configuration** will appear in bold. This action must be clicked in order for the changes to take effect.

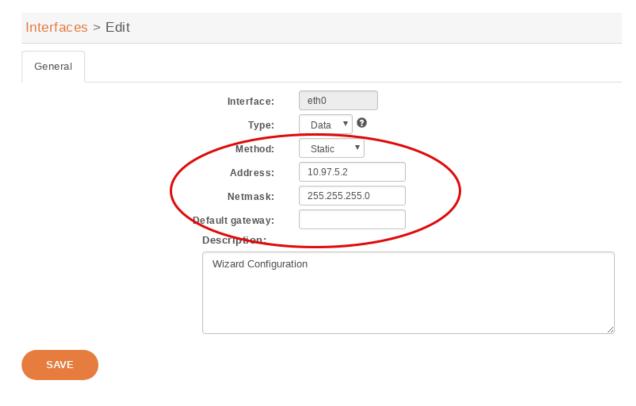

Adding a VLAN interface

In this example, the XiVO already has 2 network interfaces configured:

Listing the network interfaces

| Interfaces > Edit | |
|--|--|
| General | |
| Interface: Type: Method: Address: Netmask: | eth0 Data Control Con |
| Default gateway: Description: Wizard Configura | ation |

Fig. 4.3: Configuration \rightarrow Network \rightarrow Interfaces \rightarrow eth1 \rightarrow Add

| Legend - | | | | | | | |
| Enable O Disable — Not apply | | | | | | | |

Fig. 4.6: Configuration \rightarrow Network \rightarrow Interfaces

To add and configure a new VLAN interface, we click on the small plus button in the top right corner,

Fig. 4.7: Configuration \rightarrow Network \rightarrow Interfaces \rightarrow Add button

and we get to this page:

| eneral | |
|------------------------------|----------|
| Physical Interface of VLAN : | eth0 • |
| ID of VLAN : | |
| Туре: | Data 🔻 🚱 |
| Method: | Static • |
| Address: | |
| Netmask: | |
| Default gateway: | |
| Description: | |
| | |
| SAVE | |

In our case, since we want to configure this interface with static information:

Click on **Save** list the network interfaces:

• The new virtual interface has been successfully created.

Note: Do not forget after you finish the configuration of the network to apply it with the button: **Apply network configuration**

After applying the network configuration:

Add static network routes

Static routes cannot be added via the web interface. However, you may add static routes to your XiVO by following following the steps described below. This procedure will ensure that your static routes are applied at startup (i.e. each time the network interface goes up).

| General | | |
|---------|------------------------------|---------------|
| | Physical Interface of VLAN : | eth0 🔻 |
| | ID of VLAN : | 101 |
| | Туре: | Data 🔻 🚱 |
| | Method: | Static • |

1. Create the file /etc/network/if-up.d/xivo-routes:

```
touch /etc/network/if-up.d/xivo-routes
chmod 755 /etc/network/if-up.d/xivo-routes
```

2. Insert the following content:

#!/bin/sh

```
if [ "${IFACE}" = "<network interface>" ]; then
    ip route add <destination> via <gateway>
    ip route add <destination> via <gateway>
fi
```

3. Fields <network interface>, <destination> and <gateway> should be replaced by your specific configuration. For example, if you want to add a route for 192.168.50.128/25 via 192.168.17.254 which should be added when eth0 goes up:

```
#!/bin/sh
if [ "${IFACE}" = "eth0.2" ]; then
    ip route add 192.168.50.128/25 via 192.168.17.254
fi
```

Note: The above check is to ensure that the route will be applied only if the correct interface goes up. This check should contain the actual name of the interface (i.e. *eth0* or *eth0.2* or *eth1* or ...). Otherwise the route won't be set up in every cases.

Change interface MTU

Warning: Manually changing the MTU is risky. Please only proceed if you are aware of what you are doing.

These steps describe how to change the MTU:

```
#. Create the file :file:`/etc/network/if-up.d/xivo-mtu`::
```

touch /etc/network/if-up.d/xivo-mtu chmod 755 /etc/network/if-up.d/xivo-mtu

1. Insert the following content:

#!/bin/sh

```
# Set MTU per iface
if [ "${IFACE}" = "<data interface>" ]; then
    ip link set ${IFACE} mtu <data mtu>
elif [ "${IFACE}" = "<voip interface>" ]; then
    ip link set ${IFACE} mtu <voip mtu>
fi
```

- 2. Change the *<data interface>* to the name of your interface (e.g. eth0), and the *<data mtu>* to the new MTU (e.g. 1492),
- 3. Change the *<voip interface>* to the name of your interface (e.g. eth1), and the *<voip mtu>* to the new MTU (e.g. 1488)

Note: In the above example you can set a different MTU per interface. If you don't need a per-interface MTU you can simply write:

#!/bin/sh

ip link set \${IFACE} mtu <my mtu>

Backup

Periodic backup

A backup of the database and the data are launched every day with a logrotate task. It is run at 06:25 a.m. and backups are kept for 7 days.

Logrotate task:

/etc/logrotate.d/xivo-backup

Logrotate cron:

/etc/cron.daily/logrotate

Retrieve the backup

You can retrieve the backup from the web-interface in Services \rightarrow IPBX \rightarrow IPBX Configuration \rightarrow Backup Files page.

Otherwise, with shell access, you can retrieve them in /var/backups/xivo. In this directory you will find db.tgz and data.tgz files for the database and data backups.

Backup scripts:

/usr/sbin/xivo-backup

Backup location:

/var/backups/xivo

What is actually backed-up?

Data

Here is the list of folders and files that are backed-up:

- /etc/asterisk/
- /etc/consul/
- /etc/crontab
- /etc/dahdi/
- /etc/dhcp/
- /etc/hostname
- /etc/hosts
- /etc/ldap/
- /etc/network/if-up.d/xivo-routes
- /etc/network/interfaces
- /etc/ntp.conf

- /etc/profile.d/xivo_uuid.sh
- /etc/resolv.conf
- /etc/ssl/
- /etc/systemd/
- /etc/wanpipe/
- /etc/xivo-agentd/
- /etc/xivo-agid/
- /etc/xivo-amid/
- /etc/xivo-auth/
- /etc/xivo-call-logd/
- /etc/xivo-confd/
- /etc/xivo-confgend-client/
- /etc/xivo-ctid/
- /etc/xivo-dird/
- /etc/xivo-dird-phoned/
- /etc/xivo-dxtora/
- /etc/xivo-purge-db/
- /etc/xivo/
- /etc/xivo-xuc.conf
- /usr/local/bin/
- /usr/local/sbin/
- /usr/share/xivo/XIVO-VERSION
- /var/lib/asterisk/
- /var/lib/consul/
- /var/lib/xivo-provd/
- /var/lib/xivo/
- /var/log/asterisk/
- /var/spool/asterisk/
- /var/spool/cron/crontabs/

The following files/folders are excluded from this backup:

- folders:
 - /var/lib/consul/checks
 - /var/lib/consul/raft
 - /var/lib/consul/serf
 - /var/lib/consul/services
 - /var/lib/xivo-provd/plugins/*/var/cache/*
 - /var/spool/asterisk/monitor/
 - /var/spool/asterisk/meetme/
- files

- /var/lib/xivo-provd/plugins/xivo-polycom*/var/tftpboot/*.ld

- log files, coredump files
- · audio recordings
- and, files greater than 10 MiB or folders containing more than 100 files if they belong to one of these folders:
 - /var/lib/xivo/sounds/
 - /var/lib/asterisk/sounds/custom/
 - /var/lib/asterisk/moh/
 - /var/spool/asterisk/voicemail/
 - /var/spool/asterisk/monitor/

Database

The database asterisk from PostgreSQL is backed up. This include almost everything that is configured via the web interface.

Creating backup files manually

Warning: A backup file may take a lot of space on the disk. You should check the free space on the partition before creating one.

Database

You can manually create a *database* backup file named db-manual.tgz in /var/tmp by issuing the following commands:

xivo-backup db /var/tmp/db-manual

Files

You can manually create a *data* backup file named data-manual.tgz in /var/tmp by issuing the following commands:

```
xivo-backup data /var/tmp/data-manual
```

Restore

Introduction

A backup of both the configuration files and the database used by a XiVO installation is done automatically every day. These backups are created in the /var/backups/xivo directory and are kept for 7 days.

Limitations

- You must restore a backup on the **same version** of XiVO that was backed up (though the architecture i386 or amd64 may differ)
- You must restore a backup on a machine with the same hostname and IP address

- Be aware that this procedure applies only to XiVO >= 14.08
- XiVO CC configuration files are not backed up. Follow Manual XiVO PBX configuration to restore them.

Before Restoring the System

Warning: Before restoring a XiVO on a fresh install you have to setup XiVO using the wizard (see *Running the Wizard* section).

Stop monit and all the xivo services:

xivo-service stop

If you want to restore XiVO < 2017.06 that was configured for XiVO CC, you must create PostgreSQL user *stats* before restoring the database. See *Creating user stats*.

Restoring System Files

System files are stored in the data.tgz file located in the /var/backups/xivo directory.

This file contains for example, voicemail files, musics, voice guides, phone sets firmwares, provisioning server configuration database.

To restore the file

```
tar xvfp /var/backups/xivo/data.tgz -C /
```

Restoring the Database

Warning:

- This will destroy all the current data in your database.
- You have to check the free space on your system partition before extracting the backups.

Database backups are created as db.tgz files in the /var/backups/xivo directory. These tarballs contains a dump of the database used in XiVO.

In this example, we'll restore the database from a backup file named db.tgz placed in the home directory of root.

First, extract the content of the db.tgz file into the /var/tmp directory and go inside the newly created directory:

```
tar xvf db.tgz -C /var/tmp
cd /var/tmp/pg-backup
```

Drop the asterisk database and restore it with the one from the backup:

```
sudo -u postgres dropdb asterisk
sudo -u postgres pg_restore -C -d postgres asterisk-*.dump
```

To finalize the restore, see After Restoring The System.

Troubleshooting

When restoring the database, if you encounter problems related to the system locale, see *PostgreSQL localization errors*.

Alternative: Restoring and Keeping System Configuration

System configuration like network interfaces is stored in the database. It is possible to keep this configuration and only restore xivo data.

Rename the asterisk database to asterisk_previous:

sudo -u postgres psql -c 'ALTER DATABASE asterisk RENAME TO asterisk_previous'

Restore the asterisk database from the backup:

sudo -u postgres pg_restore -C -d postgres asterisk-*.dump

Restore the system configuration tables from the asterisk_previous database:

```
sudo -u postgres pg_dump -c -t dhcp -t netiface -t resolvconf asterisk_previous |.
→sudo -u postgres psql asterisk
```

Drop the asterisk_previous database:

sudo -u postgres dropdb asterisk_previous

Warning: Restoring the data.tgz file also restores system files such as host hostname, network interfaces, etc. You will need to reapply the network configuration if you restore the data.tgz file.

After Restoring The System

Resynchronize the xivo-auth keys:

xivo-update-keys

Update systemd runtime configuration:

```
source /etc/profile.d/xivo_uuid.sh
systemctl set-environment XIVO_UUID=$XIVO_UUID
systemctl daemon-reload
```

Restart the services you stopped in the first step:

xivo-service start

You may also reboot the system.

CLI Tools

XiVO comes with a collection of console (CLI) tools to help administer the server.

xivo-dist

xivo-dist is the xivo repository sources manager. It is used to switch between distributions (production, development, release candidate, archived version). Example use cases :

- switch to production repository : xivo-dist xivo-five
- switch to development repository : xivo-dist xivo-dev
- switch to release candidate repository : xivo-dist xivo-rc
- switch to an archived version's repository (here 14.18): xivo-dist xivo-14.18

HTTPS certificate

X.509 certificates are used to authorize and secure communications with the server. They are mainly used for HTTPS, but can also be used for SIPS, CTIS, WSS, etc.

There are two categories of certificates in XiVO:

- the default certificate, used for HTTPS in the web interface, REST APIs and WebSockets
- the certificates created and managed via the web interface

This article is about the former. For the latter, see *Telephony certificates*.

Default certificate

XiVO uses HTTPS where possible. The certificates are generated at install time (or during the upgrade to 15.12+). The main certificate is placed in /usr/share/xivo-certs/server.crt.

However, this certificate is self-signed, and HTTP clients (browser or REST API client) will complain about this default certificate because it is not signed by a trusted Certification Authority (CA).

The default certificate is untrusted

To make the HTTP client accept this certificate, you have two choices:

- configure your HTTP client to trust the self-signed XiVO certificate by adding a new trusted CA. The CA certificate (or bundle) is the file /usr/share/xivo-certs/server.crt.
- replace the self-signed certificate with your own trusted certificate.

Use your own certificate

For this, follow these steps:

- 1. Replace the following files with your own private key/certificate pair:
- Private key: /usr/share/xivo-certs/server.key
- Certificate: /usr/share/xivo-certs/server.crt
- 2. Change the hostname of XiVO for each XiVO component: the different processes of XiVO heavily use HTTPS for internal communication, and for these connection to establish successfully, all hostnames used must match the Common Name (CN) of your certificate. Basically, you must replace all occurrences of localhost (the default hostname) with your CN in the *configuration of the XiVO services*. For example:

```
mkdir /etc/xivo/custom
cat > /etc/xivo/custom/custom-certificate.yml << EOF</pre>
consul:
 host: xivo.example.com
auth:
 host: xivo.example.com
confd:
 host: xivo.example.com
dird:
 host: xivo.example.com
aiam:
 host: xivo.example.com
agentd:
 host: xivo.example.com
EOF
for config_dir in /etc/xivo-*/conf.d/ ; do
   ln -s "/etc/xivo/custom/custom-certificate.yml" "$config_dir/010-custom-
⇔certificate.yml"
done
```

Also, you must replace localhost in the definition of your directories in the web interface under *Configuration* \rightarrow *Directories*.

3. If your certificate is not self-signed, and you obtained it from a third-party CA that is trusted by your system, you must enable the system-based certificate verification. By default, certificate verification is set to consider /usr/share/xivo-certs/server.crt as the only CA certificate.

The options are the following:

- Consul: verify: True
- Other XiVO services: verify_certificate: True

The procedure is the same as 2. with more configuration for each service. For example:

```
cat > /etc/xivo/custom/custom-certificate.yml << EOF
consul:
    host: xivo.example.com
    verify: True
auth:
    host: xivo.example.com
    verify_certificate: True
dird:
    host: xivo.example.com
    verify_certificate: True
...</pre>
```

Setting verify_certificate to False will disable the certificate verification, but the connection will still be encrypted. This is pretty safe as long as XiVO services stay on the same machine, however, this is dangerous when XiVO services are separated by an untrusted network, such as the Internet.

- 4. Ensure your CN resolves to a valid IP address with either:
 - a DNS entry
 - an entry in /etc/hosts resolving your CN to 127.0.0.1. Note that /etc/hosts will be rewritten occasionally by xivo-sysconfd. To make the change persistent, you can:
 - (a) modify /usr/share/xivo-sysconfd/templates/resolvconf/hosts instead (which will be rewritten when xivo-sysconfd is upgraded...)
 - (b) then add a script in /usr/share/xivo-upgrade/pre-start.d to re-apply the modification to /usr/share/xivo-sysconfd/templates/resolvconf/hosts after each xivo-upgrade.
- 5. Restart all XiVO services:

xivo-service restart all

Configuration Files

This section describes some of the XiVO configuration files.

Configuration priority

Usually, the configuration is read from two locations: a configuration file config.yml and a configuration directory conf.d.

Files in the conf.d extra configuration directory:

- are used in alphabetical order and the first one has priority
- are ignored when their name starts with a dot
- are ignored when their name does not end with .yml

For example:

.01-critical.yml:

log_level: critical

02-error.yml.dpkg-old:

log_level: error

10-debug.yml:

log_level: debug

20-nodebug.yml:

log_level: info

The value that will be used for log_level will be debug since:

- 10-debug.yml comes before 20-nodebug.yml in the alphabetical order.
- .01-critical.yml starts with a dot so is ignored
- 02-error.yml.dpkg-old does not end with .yml so is ignored

File configuration structure

Configuration files for every service running on a XiVO server will respect these rules:

- Default configuration directory in /etc/xivo-{service}/conf.d (e.g. /etc/xivo-agentd/ conf.d/)
- Default configuration file in /etc/xivo-{service}/config.yml(e.g. /etc/xivo-agentd/ config.yml)

The files /etc/xivo-{service}/config.yml should not be modified because **they will be overridden during upgrades**. However, they may be used as examples for creating additional configuration files as long as they respect the *Configuration priority*. Any exceptions to these rules are documented below.

xivo-agentd

- Default configuration directory: /etc/xivo-agentd/conf.d
- Default configuration file: /etc/xivo-agentd/config.yml

xivo-amid

- Default configuration directory: /etc/xivo-amid/conf.d
- Default configuration file: /etc/xivo-amid/config.yml

xivo-auth

- Default configuration directory: /etc/xivo-auth/conf.d
- Default configuration file: /etc/xivo-auth/config.yml

xivo-confgend

- Default configuration directory: /etc/xivo-confgend/conf.d
- Default configuration file: /etc/xivo-confgend/config.yml
- Default templates directory: /etc/xivo-confgend/templates

xivo-ctid

- Default configuration directory: /etc/xivo-ctid/conf.d
- Default configuration file: /etc/xivo-ctid/config.yml

xivo-dao

- Default configuration directory: /etc/xivo-dao/conf.d
- Default configuration file: /etc/xivo-dao/config.yml

This configuration is read by many XiVO programs in order to connect to the Postgres database of XiVO.

xivo-dird-phoned

- Default configuration directory: /etc/xivo-dird-phoned/conf.d
- Default configuration file: /etc/xivo-dird-phoned/config.yml

xivo_ring.conf

- Path: /etc/xivo/asterisk/xivo_ring.conf
- Purpose: This file can be used to change the ringtone played by the phone depending on the origin of the call.

Warning: Note that this feature has not been tested for all phones and all call flows. This page describes how you can customize this file but does not intend to list all validated call flows or phones.

This file xivo_ring.conf consists of :

- profiles of configuration (some examples for different brands are already included: [aastra], [snom] etc.)
- one section named [number] where you apply the profile to an extension or a context etc.

Here is the process you should follow if you want to use/customize this feature :

1. Create a new profile, e.g.:

[myprofile-aastra]

2. Change the phonetype accordingly, in our example:

```
[myprofile-aastra]
phonetype = aastra
```

3. Chose the ringtone for the different type of calls (note that the ringtone names are brand-specific):

```
[myprofile-aastra]
phonetype = aastra
intern = <Bellcore-drl>
group = <Bellcore-dr2>
```

- 4. Apply your profile, in the section [number]
- to a given list of extensions (e.g. 1001 and 1002):

```
1001@default = myprofile-aastra
1002@default = myprofile-aastra
```

• or to a whole context (e.g. default):

```
@default = myprofile-aastra
```

5. Restart xivo-agid service:

service xivo-agid restart

ipbx.ini

- Path: /etc/xivo/web-interface/ipbx.ini
- Purpose: This file specifies various configuration options and paths related to Asterisk and used by the web interface.

Here is a partial glimpse of what can be configured in file ipbx.ini:

1. Enable/Disable modification of SIP line username and password:

```
[user]
readonly-idpwd = "true"
```

When editing a SIP line, the username and password fields cannot be modified via the web interface. Set this option to false to enable the modification of both fields. This option is set to "true" by default.

Warning: This feature is not fully tested. It should be used only when absolutely necessary and with great care.

Consul

The default consul installation in XiVO uses the configuration file in /etc/consul/xivo/*.json. All files in this directory are installed with the package and *should not* be modified by the administrator. To use a different configuration, the administrator can add it's own configuration file at another location and set the new configuration directory by creating a systemd unit drop-in file in the /etc/systemd/system/consul.service.d directory.

The default installation generates a master token that can be retrieved in /var/lib/consul/ master_token. This master token will not be used if a new configuration is supplied.

Variables

The following environment variables can be overridden in a systemd unit drop-in file:

- CONFIG_DIR: the consul configuration directory
- WAIT_FOR_LEADER: should the "start" action wait for a leader ?

Example, in /etc/systemd/system/consul.service.d/custom.conf:

```
[Service]
Environment=CONFIG_DIR=/etc/consul/agent
Environment=WAIT_FOR_LEADER=no
```

Agent mode

It is possible to run consul on another host and have the local consul node run as an agent only.

To get this kind of setup up and running, you will need to follow the following steps.

Downloading Consul

For a 32 bits system

For a 64 bits system

Installing Consul on a new host

unzip consul_0.5.2_linux_386.zip

Or

```
unzip consul_0.5.2_linux_amd64.zip
```

Copying the consul configuration from the XiVO to a new host

On the new consul host, modify /etc/consul/xivo/config.json to include to following lines.

```
"bind_addr": "0.0.0.0",
"client_addr": "0.0.0.0",
"advertise_addr": "<consul-host>"

# on the consul host
scp root@<xivo-host>:/lib/systemd/system/consul.service /lib/systemd/system
systemctl daemon-reload
scp -r root@<xivo-host>:/etc/consul /etc
scp -r root@<xivo-host>:/usr/share/xivo-certs /usr/share
consul agent -data-dir /var/lib/consul -config-dir /etc/consul/xivo/
```

Note: To start consul with the systemd unit file, you may need to change owner and group (consul:consul) for all files inside /etc/consul, /usr/share/xivo-certs and /var/lib/consul

Adding the agent configuration

Create the file /etc/consul/agent/config.json with the following content

```
{
   "acl_datacenter": "<node_name>",
   "datacenter": "xivo",
   "server": false,
   "bind_addr": "0.0.0.0",
   "advertise_addr": "<xivo_address>",
   "client_addr": "127.0.0.1",
   "bootstrap": false,
   "rejoin_after_leave": true,
   "data_dir": "/var/lib/consul",
   "enable_syslog": true,
   "disable_update_check": true,
   "log_level": "INFO",
   "ports": {
       "dns": -1,
       "http": -1,
       "https": 8500
   },
   "retry_join": [
        "<remote_host>"
   ],
   "cert_file": "/usr/share/xivo-certs/server.crt",
   "key_file": "/usr/share/xivo-certs/server.key"
```

• node_name: Arbitrary name to give this node, xivo-paris for example.

• remote_host: IP address of your new consul. Be sure the host is accessible from your XiVO and check the firewall. See the documentation *here*.

• xivo_address: IP address of your xivo.

This file should be owned by consul user.

chown -R consul:consul /etc/consul/agent

Enabling the agent configuration

Add or modify /etc/systemd/system/consul.service.d/custom.conf to include the following lines:

```
[Service]
Environment=CONFIG_DIR=/etc/consul/agent
```

Restart your consul server.

```
service consul restart
```

Updating the consul section of xivo-ctid

Add a file in /etc/xivo-ctid/conf.d/remote_consul.yml with the following content

```
rest_api:
   http:
    listen: 0.0.0.0
service_discovery:
   advertise_address: <xivo-ctid-host>
   check_url: http://<xivo-ctid-host>:9495/0.1/infos
```

• xivo-ctid-host: Hostname to reach xivo-ctid

Log Files

Every XiVO service has its own log file, placed in /var/log.

asterisk

The Asterisk log files are managed by logrotate.

It's configuration files /etc/logrotate.d/asterisk and /etc/asterisk/logger.conf

The message log level is enabled by default in logger.conf and contains notices, warnings and errors. The full log entry is commented in logger.conf and should only be enabled when verbose debugging is required. Using this option in production would produce VERY large log files.

- Files location: /var/log/asterisk/*
- Number of archived files: 15
- Rotation frequence: Daily

xivo-agentd

- File location: /var/log/xivo-agentd.log
- Rotate configuration: /etc/logrotate.d/xivo-agentd

- Number of archived files: 15
- Rotation frequence: Daily

xivo-agid

- File location: /var/log/xivo-agid.log
- Rotate configuration: /etc/logrotate.d/xivo-agid
- Number of archived files: 15
- Rotation frequence: Daily

xivo-amid

- File location: /var/log/xivo-amid.log
- Rotate configuration: /etc/logrotate.d/xivo-amid
- Number of archived files: 15
- Rotation frequence: Daily

xivo-auth

- File location: /var/log/xivo-auth.log
- Rotate configuration: /etc/logrotate.d/xivo-auth
- Number of archived files: 15
- Rotation frequence: Daily

xivo-call-logd

- File location: /var/log/xivo-call-logd.log
- Rotate configuration: /etc/logrotate.d/xivo-call-logd
- Number of archived files: 15
- Rotation frequence: Daily

xivo-confd

- File location: /var/log/xivo-confd.log
- Rotate configuration: /etc/logrotate.d/xivo-confd
- Number of archived files: 15
- Rotation frequence: Daily

xivo-confgend

The xivo-confgend daemon output is sent to the file specified with the --logfile parameter when launched with twistd.

The file location can be changed by customizing the xivo-confgend.service unit file.

- File location: /var/log/xivo-confgend.log
- Rotate configuration: /etc/logrotate.d/xivo-confgend
- Number of archived files: 15
- Rotation frequence: Daily

xivo-ctid

- File location: /var/log/xivo-ctid.log
- Rotate configuration: /etc/logrotate.d/xivo-ctid
- Number of archived log files: 15
- Rotation frequence: Daily

xivo-dird

- File location: /var/log/xivo-dird.log
- Rotate configuration: /etc/logrotate.d/xivo-dird
- Number of archived files: 15
- Rotation frequence: Daily

xivo-dird-phoned

- File location: /var/log/xivo-dird-phoned.log
- Rotate configuration: /etc/logrotate.d/xivo-dird-phoned
- Number of archived files: 15
- Rotation frequence: Daily

xivo-dxtora

- File location: /var/log/xivo-dxtora.log
- Rotate configuration: /etc/logrotate.d/xivo-dxtora
- Number of archived files: 15
- Rotation frequence: Daily

xivo-provd

- File location: /var/log/xivo-provd.log
- Rotate configuration: /etc/logrotate.d/xivo-provd
- Number of archived files: 15
- Rotation frequence: Daily

xivo-purge-db

- File location: /var/log/xivo-purge-db.log
- Rotate configuration: /etc/logrotate.d/xivo-purge-db
- Number of archived files: 15
- Rotation frequence: Daily

xivo-stat

- File location: /var/log/xivo-stat.log
- Rotate configuration: /etc/logrotate.d/xivo-stat
- Number of archived files: 15
- Rotation frequence: Daily

xivo-sysconfd

- File location: /var/log/xivo-sysconfd.log
- Rotate configuration: /etc/logrotate.d/xivo-sysconfd
- Number of archived files: 15
- Rotation frequence: Daily

xivo-upgrade

- File location: /var/log/xivo-upgrade.log
- Rotate configuration: /etc/logrotate.d/xivo-upgrade
- Number of archived files: 15
- Rotation frequence: Daily

xivo-web-interface

- File location: /var/log/xivo-web-interface/*.log
- Rotate configuration: /etc/logrotate.d/xivo-web-interface
- Number of archived files: 21
- Rotation frequence: Daily

Nginx

XiVO use nginx as a web server and reverse proxy.

In its default configuration, the nginx server listens on port TCP/80 and TCP/443 and allows these services to be used:

- web interface (xivo-web-interface)
- API documentation (xivo-swagger-doc)

Starting from XiVO 16.13, an administrator can easily modify the configuration to allow additional services to be used (e.g. xivo-auth or xivo-confd).

To do so, an administrator only has to create a symbolic link inside the /etc/nginx/locations/ http-enabled directory to the corresponding file in the /etc/nginx/locations/http-available directory, and then reload nginx with systemctl reload nginx. A similar operation must be done for HTTPS.

For example, to enable all the available services:

```
ln -sf /etc/nginx/locations/http-available/* /etc/nginx/locations/http-enabled
ln -sf /etc/nginx/locations/https-available/* /etc/nginx/locations/https-enabled
systemctl reload nginx
```

To disable all the services other than the web interface:

NTP

XiVO has a NTP server, that must be synchronized to a reference server. This can be a public one or customized for specific target networking architecture. XiVO's NTP server is used by default as NTP server for the devices time reference.

Usage

Show NTP service status:

service ntp status

Stop NTP service:

service ntp stop

Start NTP service:

service ntp start

Restart NTP service:

service ntp restart

Show NTP synchronization status:

ntpq -p

Configuring NTP service

- 1. Edit /etc/ntp.conf
- 2. Give your NTP reference servers:

```
server 192.168.0.1  # LAN existing NTP Server
server 0.debian.pool.ntp.org iburst dynamic  # default in ntp.conf
server 1.debian.pool.ntp.org iburst dynamic  # default in ntp.conf
```

3. If no reference server to synchronize to, add this to synchronize locally:

```
      server 127.127.1.0
      # local clock (LCL)

      fudge 127.127.1.0 stratum 10
      # LCL is not very reliable
```

- 4. Restart NTP service
- 5. Check NTP synchronization status.

Warning: If #5 shows that NTP doesn't use NTP configuration in /etc/ntp.conf, maybe have you done a dhclient for one of your network interface and the dhcp server that gave the IP address also gave a NTP server address. Thus you might check if the file /var/lib/ntp/ntp.conf.dhcp exists, if yes, this is used for NTP configuration prior to /etc/ntp.conf. Remove it and restart NTP, check NTP synchronization status, then it should work.

Proxy Configuration

If you use XiVO behind an HTTP proxy, you must do a couple of manipulations for it to work correctly.

apt

Create the /etc/apt/apt.conf.d/90proxy file with the following content:

Acquire::http::Proxy "http://domain\username:password@proxyip:proxyport";

provd

Proxy information is set via the *Configuration* \rightarrow *Provisioning* \rightarrow *General* page.

dhcp-update

This step is needed if you use the DHCP server of the XiVO. Otherwise the DHCP configuration won't be correct. Proxy information is set via the /etc/xivo/dhcpd-update.conf file. Edit the file and look for the [proxy] section.

xivo-fetchfw

This step is not needed if you don't use xivo-fetchfw. Proxy information is set via the /etc/xivo/xivo-fetchfw.conf file. Edit the file and look for the [proxy] section.

Service Discovery

Overview

XiVO uses consul for service discovery. When a daemon is started, it registers itself on the configured consul node.

Consul template may be used to generate the configuration files for each daemons that requires the availability of another service. Consul template can also be used to reload the appropriate service.

Service Authentication

XiVO services expose more and more resources through REST API, but they also ensure that the access is restricted to the authorized programs. For this, we use an *authentication daemon* who delivers authorizations via tokens.

Call flow

Here is the call flow to access a REST resource of a XiVO service:

- 1. Create a username/password (also called service_id/service_key) with the right ACLs, via Web Services Access.
- 2. Create a token with these credentials and the backend xivo-service.
- 3. Use this token to access the REST resource defined by the ACL.

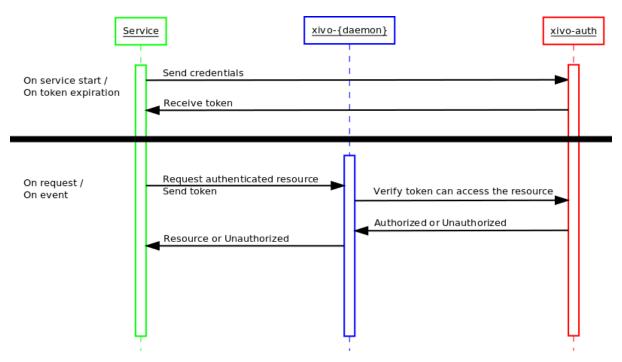

Fig. 4.12: Call flow of service authentication

Service Service who needs to access a REST resource.

xivo-{daemon} Server that exposes a REST resource. This resource must have an attached ACL.

xivo-auth Server that authenticates the Service and validates the required ACL with the token.

XiVO services directly use this system to communicate with each other, as you can see in their Web Services Access.

xivo-auth

xivo-auth is a scalable, extendable and configurable authentication service. It uses an HTTP interface to emit tokens to users who can then use those tokens to identify and authenticate themselves with other services compatible with xivo-auth.

xivo-auth HTTP API Changelog

2018.04

• Added static tokens for internal service authentication

16.02

- POST /0.1/token, field expiration: only integers are accepted, floats are now invalid.
- Experimental backend ldap_user_voicemail has been removed.
- New backend ldap_user has been added.

15.19

• POST /0.1/token do not accept anymore argument backend_args

15.17

• New backend ldap_user_voicemail has been added. WARNING this backend is EXPERIMENTAL.

15.16

- HEAD and GET now take a new scope query string argument to check ACLs
- Backend interface method get_acls is now named get_consul_acls
- Backend interface method get_acls now returns a list of ACLs
- HEAD and GET can now return a 403 if an ACL access is denied

15.15

- POST /0.1/token accept new argument backend_args
- Signature of backend method get_ids () has a new argument args
- New method get_acls for backend has been added
- New backend service has been added

xivo-auth Developer's Guide

Architecture

xivo-auth contains 4 major components, an HTTP interface, a celery worker, authentication backends and a consul client. All operations are made through the HTTP interface, tokens are stored by consul as well as the persistence for some of the data attached to tokens. The celery worker is used to schedule tasks that outlive the lifetime of the xivo-auth process. Backends are used to test if a supplied username/password combination is valid and provide the xivo-user-uuid.

xivo-auth is made of the following modules and packages.

plugins

the plugin package contains the xivo-auth backends that are packaged with xivo-auth.

http

The http module is the implementation of the HTTP interface.

- Validate parameters
- Calls the backend the check the user authentication
- Forward instructions to the *token_manager*
- Handle exceptions and return the appropriate status_code

controller

The controller is the plumbin of xivo-auth, it has no business logic.

- Start the HTTP application
- Start the celery worker
- Load all enabled plugins
- Instanciate the token_manager

token

The token modules contains the business logic of xivo-auth.

- · Creates and delete tokens
- Creates ACLs for XiVO
- Schedule token expiration
- Read/write token data to consul

tasks

The tasks module contains implementation of celery tasks that are executed by the worker.

- Called by the celery worker
- Forwards instructions to the *token manager*

extension

This is a place holder for a global variable for the celery app. It will be removed and should not be used.

Other modules that should not need documentation are helpers, config, interfaces

Plugins

xivo-auth is meant to be easy to extend. This section describes how to add features to xivo-auth.

Backends

xivo-auth allows its administrator to configure one or many sources of authentication. Implementing a new kind of authentication is quite simple.

- 1. Create a python module implementing the backend interface.
- 2. Install the python module with an entry point xivo_auth.backends

An example backend implementation is available here.

Internal services

To simplify authentication of internal services without renewing the Token we have added a command line tool *xivo-auth-static-token-manager* to manage static tokens. Currently you can get a static token, which is created automatically during the installation. The same tool can be used to create a new one if needed. The static token is created with default acl: *confd.users.read*.

Stock Plugins Documentation

Backends Plugins

XiVO Admin

Backend name: xivo_admin

Purpose: Authenticate a XiVO administrator. The login/password is configured in *Configuration* \rightarrow *Management* \rightarrow *Users*.

XiVO Service

Backend name: xivo_service

Purpose: Authenticate a XiVO Web Services Access. The login/password is configured in Configuration \rightarrow Management \rightarrow Web Service Access.

XiVO User

Backend name: xivo_user

Purpose: Authenticate a XiVO user. The login/password is configured in *IPBX* \rightarrow *Services* \rightarrow *PBX Settings* \rightarrow *Users* in the CTI client section.

LDAP

Backend name: ldap_user

Purpose: Authenticate with an LDAP user.

For example, with the given configuration:

```
ldap:
    uri: ldap://example.org
    bind_dn: cn=xivo,dc=example,dc=org
    bind_password: bindpass
    user_base_dn: ou=people,dc=example,dc=org
    user_login_attribute: uid
    user_email_attribute: mail
```

When an authentication request is received for username alice and password userpass, the backend will:

- 1. Connect to the LDAP server at example.org
- 2. Do an LDAP "bind" operation with bind DN cn=xivo,dc=example,dc=org and password bindpass
- 3. Do an LDAP "search" operation to find an LDAP user matching alice, using:
 - the base DN ou=people, dc=example, dc=org
 - the filter (uid=alice)
 - a SUBTREE scope
- 4. If the search returns exactly 1 LDAP user, do an LDAP "bind" operation with the user's DN and the password userpass
- 5. If the LDAP "bind" operation is successful, search in XiVO a user with an email matching the mail attribute of the LDAP user
- 6. If a XiVO user is found, success

To use an anonymous bind instead, the following configuration would be used:

```
ldap:
    uri: ldap://example.org
    bind_anonymous: True
    user_base_dn: ou=people,dc=example,dc=org
    user_login_attribute: uid
    user_email_attribute: mail
```

The backend can also works in a "no search" mode, for example with the following configuration:

```
ldap:
    uri: ldap://example.org
    user_base_dn: ou=people,dc=example,dc=org
    user_login_attribute: uid
    user_email_attribute: mail
```

When the server receives the same authentication request as above, it will directly do an LDAP "bind" operation with the DN uid=alice, ou=people, dc=example, dc=org and password userpass, and continue at step 5.

Note: User's email and voicemail's email are two separate things. This plugin only use the user's email.

Configuration

uri the URI of the LDAP server. Can only contain the scheme, host and port of an LDAP URL.

user_base_dn the base dn of the user

user_login_attribute the attribute to login a user

user_email_attribute (optional) the attribute to match with the XiVO user's email (default: mail)

bind_dn (optional) the bind DN for searching for the user DN.

bind_password (optional) the bind password for searching for the user DN.

bind_anonymous (optional) use anonymous bind for searching for the user DN (default: false)

Usage

xivo-auth is used through HTTP requests, using HTTPS. Its default port is 9497. As a user, the most common operation is to get a new token. This is done with the POST method.

Alice retrieves a token using her username/password:

In this example Alice used here XiVO CTI client login alice and password s3cre7. The authentication source is determined by the *backend* in the POST data.

Alice could also have specified an expiration time on her POST request. The expiration value is the number of seconds before the token expires.

After retrieving her token, Alice can query other services that use xivo-auth and send her token to those service. Those services can then use this token on Alice's behalf to access her personal storage.

If Alice wants to revoke her token before its expiration:

```
$ curl -k -X DELETE -H 'Content-Type: application/json' "https://localhost:9497/0.
→1/token/1823clee-6c6a-0cdc-d869-964a7f08a744"
```

See Service Authentication for details about the authentication process.

Usage for services using xivo-auth

A service that requires authentication and identification can use xivo-auth to externalise the burden of authentication. The new service can then accept a token as part of its operations to authenticate the user using the service.

Once a service receives a token from one of its user, it will need to check the validity of that token. There are 2 forms of verification, one that only checks if the token is valid and the other returns information about this token's session if it is valid.

Checking if a token is valid:

```
$ curl -k -i -X HEAD -H 'Content-Type: application/json' "https://localhost:9497/0.
→1/token/1823clee-6c6a-0cdc-d869-964a7f08a744"
HTTP/1.1 204 NO CONTENT
Content-Type: text/html; charset=utf-8
Content-Length: 0
```

Launching xivo-auth

HTTP API Reference

See also the xivo-auth HTTP API Changelog.

Development

See xivo-auth Developer's Guide.

xivo-confd

xivo-confd is a HTTP server that provides a RESTful API service for configuring and managing basic resources on a XiVO server.

Developer's Guide (xivo-confd)

xivo-confd resources are organised through a plugin mechanism. There are 2 main plugin categories:

- **Resource plugins** A plugin that manages a resource (e.g. users, extensions, voicemails, etc). A resource plugin exposes the 4 basic CRUD operations (Create, Read, Update, Delete) in order to operate on a resource in a RESTful manner.
- Association plugins A plugin for associating or dissociating 2 resources (e.g a user and a line). An association plugin exposes an HTTP action for associating (either POST or PUT) and another for dissociating (DELETE)

The following diagram outlines the most important parts of a plugin:

Resource Class that receives and handles HTTP requests. Resources use flask-restful for handling requests.

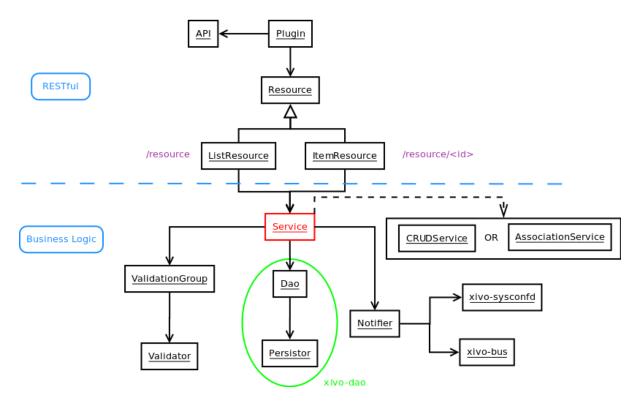

Fig. 4.13: Plugin architecture of xivo-confd

There are 2 kinds of resources: *ListResource* for root URLs and *ItemResource* for URLs that have an ID. *ListResource* will handle creating a resource (POST) and searching through a list of available resources (GET). *ItemResource* handles fetching a single item (GET), updating (PUT) and deleting (DELETE).

Service Class that handles business logic for a resource, such as what to do in order to get, create, update, or delete a resource. *Service* classes do not manipulate data directly. Instead, they coordinate what to do via other objects.

There are 2 kinds of services: *CRUDService* for basic CRUD operations in *Resource plugins*, and *AssociationService* for association/dissociation operations in *Association plugins*.

- Dao Data Access Object. Knows how to get data and how to manipulate it, such as SQL queries, files, etc.
- **Notifier** Sends events after an operation has completed. An event will be sent in a messaging queue for each CRUD operation. Certain resources also need to send events to other daemons in order to reload some configuration data. (i.e. asterisk needs to reload the dialplan when an extension is updated)
- **Validator** Makes sure that a resource's data does not contain any errors before doing something with it. A *Validator* can be used for validating input data or business rules.

XiVO confgend

xivo-confgend is a configuration file generator. It is mainly used to generate the Asterisk configuration files.

XiVO confgend developer's guide

xivo-confgend uses drivers to implement the logic required to generate configuration files. It uses stevedore to do the driver instantiation and discovery.

Plugins in xivo-confgend use setuptools' entry points. That means that installing a new plugin to xivo-confgend requires an entry point in the plugin's *setup.py*.

Drivers

Driver plugin are classes that are used to generate the content of a configuration file.

The implementation of a plugin should have the following properties.

- 1. It's _____ method should take one argument
- 2. It should have a generate method which will return the content of the file
- 3. A setup.py adding an entry point

The __init__ method argument is the content of the configuration of xivo-confgend. This allows the driver implementor to add values to the configuration in /etc/xivo-confgend/conf.d/*.yml and these values will be available in the driver.

The generate method has no argument, the configuration provided to the <u>__init__</u> should be sufficient for most cases. generate is called within a scoped_session of xivo-dao, allowing the usage of xivo-dao without prior setup in the driver.

The namespaces used for entry points in xivo-confgend have the following form:

xivo_confgend.<resource>.<filename>

as an example, a generator for sip.conf would have the following namespace:

xivo_confgend.asterisk.sip.conf

Example

Here is a typical setup.py:

```
#!/usr/bin/env python
1
   # -*- coding: utf-8 -*-
2
   # Copyright 2016 by Avencall
3
   # SPDX-License-Identifier: GPL-3.0+
4
5
   from setuptools import setup
6
   from setuptools import find_packages
7
8
9
   setup(
10
11
        name='XiVO confgend driversample',
12
        version='0.0.1',
13
        description='An example driver',
14
15
        packages=find_packages(),
16
17
        entry_points={
18
             'xivo_confgend.asterisk.sip.conf': [
19
                 'my_driver = src.driver:MyDriver',
20
21
            ],
22
        }
23
   )
```

With the following package structure:

. setup.py src driver.py

driver.py:

```
# -*- coding: utf-8 -*-
1
   # Copyright 2016 by Avencall
2
   # SPDX-License-Identifier: GPL-3.0+
3
4
5
   class MyDriver(object):
6
7
       def __init__(self, config):
8
           self._config = config
9
10
       def generate(self):
11
            return 'Hello World!'
12
```

To enable this plugin, you need to:

1. Install the plugin with:

python setup.py install

2. Create a config file in /etc/xivo-confgend/conf.d:

```
plugins:
   asterisk.sip.conf: my_driver
```

3. Restart xivo-confgend:

```
systemctl restart xivo-confgend
```

XiVO dird

xivo-dird is the directory server for XiVO. It offers a simple REST interface to query all directories that are configured. xivo-dird is extendable with plugins.

xivo-dird changelog

15.20

• The ldap plugins *ldap_network_timeout* default value has been incremented from 0.1 to 0.3 seconds

15.19

- Added the voicemail type in Views configuration
- Removed reverse endpoints in REST API:
 - GET/0.1/directories/reverse/<profile>/me

15.18

- Added reverse endpoints in REST API:
 - GET /0.1/directories/reverse/<profile>/<xivo_user_uuid>
 - GET /0.1/directories/reverse/<profile>/me

15.17

- Added directories endpoints in REST API:
 - GET /0.1/directories/input/<profile>/aastra
 - GET/0.1/directories/lookup/<profile>/aastra
 - GET /0.1/directories/input/<profile>/polycom
 - GET /0.1/directories/lookup/<profile>/polycom
 - GET /0.1/directories/input/<profile>/snom
 - GET/0.1/directories/lookup/<profile>/snom
 - GET /0.1/directories/lookup/<profile>/thomson
 - GET /0.1/directories/lookup/<profile>/yealink

15.16

- Added more cisco endpoints in REST API:
 - GET /0.1/directories/input/<profile>/cisco
- Endpoint /0.1/directories/lookup/<profile>/cisco accepts a new limit and offset query string arguments.

15.15

- Added cisco endpoints in REST API:
 - GET /0.1/directories/menu/<profile>/cisco
 - GET /0.1/directories/lookup/<profile>/cisco

15.14

- Added more personal contacts endpoints in REST API:
 - GET /0.1/personal/<contact_id>
 - PUT /0.1/personal/<contact_id>
 - POST /0.1/personal/import
 - DELETE /0.1/personal
- Endpoint /0.1/personal accepts a new format query string argument.

15.13

- Added personal contacts endpoints in REST API:
 - GET /0.1/directories/personal/<profile>
 - GET /0.1/personal
 - POST /0.1/personal
 - DELETE /0.1/personal/<contact_id>
- Signature of backend method list () has a new argument args

- Argument args for backend methods list () and search () has a new key token_infos
- Argument args for backend method load() has a new key main_config
- Methods __call__() and lookup() of service plugin lookup take a new token_infos argument

15.12

- · Added authentication on all REST API endpoints
- Service plugins receive the whole configuration, rather than only their own section

XiVO dird configuration

There are three sources of configuration for xivo-dird:

- the command line options
- the main configuration file
- the sources configuration directory

The command-line options have priority over the main configuration file options.

Main Configuration File

Default location: /etc/xivo-dird/config.yml. Format: YAML

The default location may be overwritten by the command line options.

Here's an example of the main configuration file:

```
debug: False
1
2
  foreground: False
   log_filename: /var/log/xivo-dird.log
3
4
   log_level: info
   pid_filename: /var/run/xivo-dird/xivo-dird.pid
5
   source_config_dir: /etc/xivo-dird/sources.d
6
   user: www-data
7
8
   rest api:
9
10
        wsgi_socket: /var/run/xivo-dird/xivo-dird.sock

```

Root section

debug Enable log debug messages. Overrides log_level. Default: False.

foreground Foreground, don't daemonize. Default: False.

- log_filename File to write logs to. Default: /var/log/xivo-dird.log.
- log_level Logs messages with LOG_LEVEL details. Must be one of: critical, error, warning, info, debug. Default: info.
- pid_filename File used as lock to avoid multiple xivo-dird instances. Default: /var/run/xivo-dird/ xivo-dird.pid.
- **source_config_dir** The directory from which sources configuration are read. See *Sources Configuration*. Default: /etc/xivo-dird/sources.d.
- user The owner of the process. Default: www-data.

enabled_plugins section

This sections controls which plugins are to be loaded at xivo-dird startup. All plugin types must have at least one plugin enabled, or xivo-dird will not start. For back-end plugins, sources using a back-end plugin that is not enabled will be ignored.

views section

displays A dictionary describing the content of each display. The key is the display's name, and the value are the display's content.

The display content is a list of fields. Each field is a dictionary with the following keys:

- title: The label of the field
- default: The default value of the field
- type: An arbitrary identifier of the field. May be used by consumers to identify the field without matching the label. For meaningful values inside XiVO, see *Integration of XiVO dird with the rest of XiVO*.
- field: the key of the data from the source that will be used for this field.

The display may be used by a plugin view to configure which fields are to be presented to the consumer.

displays_phone A dictionary describing the content of phone-related displays. Like displays, the key is the display's name and the value is the display's content. These displays are used by phone-related view plugins, like the cisco_view plugin.

The display content contains 2 keys, name and number.

The value of the name key is a list of source result fields. For a given source result, the first field that will return a non-empty value will be used as the display name on the phone. For example, if name is configured with ["display_name", "name"] and you have a source result with fields {"display_name": "name"] "name"] and you have a source result with fields {"display_name": "Bob"}, then "Bob" will be displayed on the phone.

The value of the number key is a list of number item. Each item is composed of a dictionary containing at least a field key, and optionally a name_format key. For example, if you have the following number configuration:

```
name:

- display_name

number:

-

field:

-

field:
```

```
- phone_mobile
name_format: "{name} (Mobile)"
```

and you have a source result {"display_name": "Bob", "phone": "101",
"phone_mobile": "102"}, then 2 results will be displayed on your phone:

- 1. "Bob", with number "101"
- 2. "Bob (Mobile)", with number "102"

The name_format value is a python format string. There's two substitution variables available, {name} and {number}.

- **profile_to_display** A dictionary associating a profile to a display. It allows xivo-dird to use the right display when a consumer makes a query with a profile. The key is the profile name and the value is the display name.
- profile_to_display_phone: A dictionary associating a profile to a phone display. This is similar to profile_to_display, but only used by phone-related view plugins.

services section

This section is a dictionary whose keys are the service plugin name and values are the configuration of that service. Hence the content of the value is dependent of the service plugin. See the documentation of the service plugin (*Stock Plugins Documentation*).

sources section

This section is a dictionary whose keys are the source name and values are the configuration for that source. See the *Sources Configuration* section for more details about source configuration.

Sources Configuration

There are two ways to configure sources:

- in the sources section of the main configuration
- in files of a directory, one file for each source:
 - Default directory location /etc/xivo-dird/sources.d
 - Files format: YAML
 - File names are ignored
 - Each file listed in this directory will be read and used to create a data source for xivo-dird.

Here is an example of a CSV source configuration in its own file:

```
type: csv
1
   name: my_contacts_in_a_csv_file
2
   file: /usr/local/share/my_contacts.csv
3
   unique_column: id
4
   searched_columns:
5
       - fn
6
       - ln
7
   format_columns:
8
       name: "{fn} {ln}"
9
       number: "{num}"
10
```

This is strictly equivalent in the main configuration file:

1

2

3

4

5

6

7

8

9

10

11

12

13

type the type of the source. It must be the same than the name of one of the enabled back-end plugins.

name is the name of this given configuration. The name is used to associate the source to profiles. The value is arbitrary, but it must be unique across all sources.

Warning: Changing the name of the source will make all favorites in that source disappear. There is currently no tool to help you migrate favorites between source names, so choose your source names carefully.

The other options are dependent on the source type (the back-end used). See the documentation of the back-end plugin (*Stock Plugins Documentation*). However, the following keys should be present in all source configurations:

- **first_matched_columns (optional)** the columns used for the reverse lookup. Any column having the search term will be a reverse lookup result.
- **format_columns (optional)** a mapping between result fields and a format string. The new key will be added to the result, if this name already exists in the result, it will be replaced with the new value. The syntax is a python format string. See https://docs.python.org/2/library/string.html#formatspec for a complete reference.
- **searched_columns (optional)** the columns used for the lookup. Any column containing the search term substring will be a lookup result.
- unique_column (optional) This column is what makes an entry unique in this source. The unique_column is used to build the uid that is passed to the list method to fetch a list of results by unique ids. This is necessary for listing and identifying favorites.

XiVO dird developer's guide

The XiVO dird architecture uses plugins as extension points for most of its job. It uses stevedore to do the plugin instantiation and discovery and ABC classes to define the required interface.

Plugins in xivo-dird use setuptools' entry points. That means that installing a new plugin to xivo-dird requires an entry point in the plugin's setup.py. Each entry point's *namespace* is documented in the appropriate documentation section. These entry points allow xivo-dird to be able to discover and load extensions packaged with xivo-dird or installed separately.

Each kind of plugin does a specific job. There are three kinds of plugins in dird.

- 1. Back-End
- 2. Service
- 3. View

All plugins are instantiated by the core. The core then keeps a catalogue of loaded extensions that can be supplied to other extensions.

The following setup.py shows an example of a python library that add a plugin of each kind to xivo-dird:

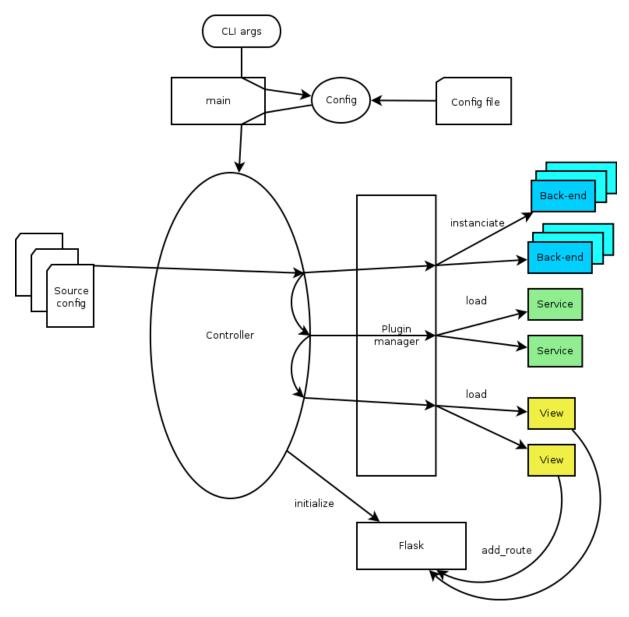

Fig. 4.14: xivo-dird startup flow

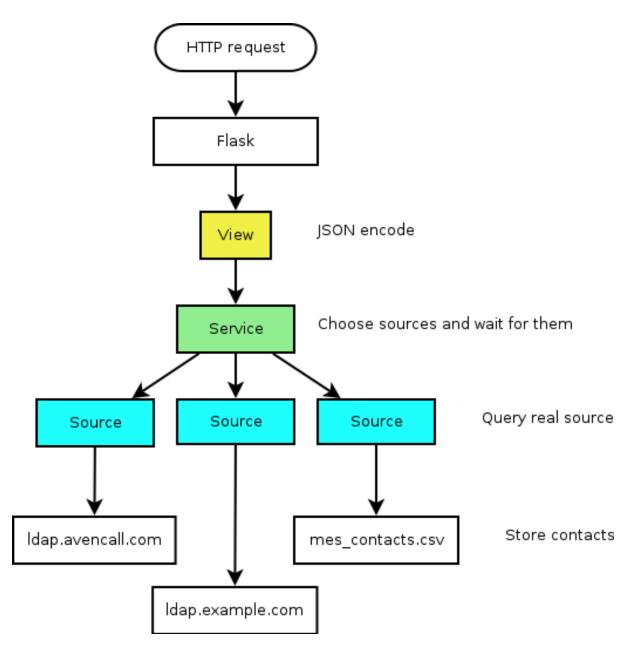

Fig. 4.15: xivo-dird HTTP query

```
#!/usr/bin/env python
1
   # -*- coding: utf-8 -*-
2
3
   from setuptools import setup
4
   from setuptools import find_packages
5
6
7
   setup(
8
        name='XiVO dird plugin sample',
9
        version='0.0.1',
10
11
        description='An example program',
12
13
        packages=find_packages(),
14
15
        entry_points={
16
            'xivo_dird.services': [
17
                 'my_service = dummy:DummyServicePlugin',
18
19
            1,
             'xivo_dird.backends': [
20
                 'my_backend = dummy:DummyBackend',
21
22
            1.
             'xivo_dird.views': [
23
                 'my_view = dummy:DummyView',
24
25
            ],
26
        }
27
   )
```

Back-End

Back-ends are used to query directories. Each back-end implements a way to query a given directory. Each instance of a given back-end is called a source. Sources are used by the services to get results from each configured directory.

Given one LDAP back-end, I can configure a source from the LDAP at alpha.example.com and another source from the other LDAP at beta.example.com. Both of these sources use the LDAP back-end.

Implementation details

- Namespace: xivo_dird.backends
- Abstract source plugin: BaseSourcePlugin
- Methods:
 - name: the name of the source, typically retrieved from the configuration injected to load ()
 - load (args): set up resources used by the plugin, depending on the config. args is a dictionary containing:
 - * key config: the source configuration for this instance of the back-end
 - * key main_config: the whole configuration of xivo-dird
 - unload(): free resources used by the plugin.
 - search (term, args): The search method returns a list of dictionary.
 - * Empty values should be None, instead of empty string.
 - * args is a dictionary containing:
 - key token_infos: data associated to the authentication token (see xivo-auth)

- first_match(term, args): The first_match method returns a dictionary.
 - * Empty values should be None, instead of empty string.
 - * args is a dictionary containing:
 - key token_infos: data associated to the authentication token (see *xivo-auth*)
- list (uids, args): The list method returns a list of dictionary from a list of uids. Each uid is a string identifying a contact within the source.
 - * args is a dictionary containing:
 - key token_infos: data associated to the authentication token (see xivo-auth)

See *Sources Configuration*. The implementation of the back-end should take these values into account and return results accordingly.

Example

The following example add a backend that will return random names and number.

dummy.py:

```
# -*- coding: utf-8 -*-
1
2
   import logging
3
4
   logger = logging.getLogger(___name___)
5
6
   class DummyBackendPlugin(object):
7
8
        def name(self):
9
            return 'my_local_dummy'
10
11
        def load(self, args):
12
            logger.info('dummy backend loaded')
13
14
        def unload(self):
15
            logger.info('dummy backend unloaded')
16
17
        def search(self, term, args):
18
            nb_results = random.randint(1, 20)
19
            return _random_list(nb_results)
20
21
        def list(self, unique_ids):
22
            return _random_list(len(unique_ids))
23
24
        def __random_list(self, nb_results):
25
            columns = ['Firstname', 'Lastname', 'Number']
26
            return [_random_entry(columns) for _ in xrange(nb_results)]
27
28
        def _random_entry(self, columns):
29
            random_stuff = [_random_string() for _ in xrange(len(columns))]
30
            return dict(zip(columns, random_stuff))
31
32
        def _random_string(self):
33
            return ''.join(random.choice(string.lowercase) for _ in xrange(5))
34
```

Service

Service plugins add new functionality to the dird server. These functionalities are available to views. When loaded, a service plugin receives its configuration and a dictionary of available sources.

Some service examples that come to mind include:

- A lookup service to search through all configured sources.
- A reverse lookup service to search through all configured sources and return a specific field of the first matching result.

Implementation details

- Namespace: xivo_dird.services
- Abstract service plugin: BaseServicePlugin
- Methods:
 - load (args): set up resources used by the plugin, depending on the config. args is a dictionary containing:
 - * key config: the whole configuration file in dict form
 - * key sources: a dictionary of source names to sources
 - load must return the service object, which is any kind of python object.
 - unload(): free resources used by the plugin.

Example

The following example adds a service that will return an empty list when used.

dummy.py:

```
# -*- coding: utf-8 -*-
1
2
   import logging
3
4
   from xivo_dird import BaseServicePlugin
5
6
   logger = logging.getLogger(_______)
7
8
   class DummyServicePlugin(BaseServicePlugin):
9
        .....
10
        This plugin is responsible fow instantiating and returning the
11
        DummyService. It manages its life time and should take care of
12
        its cleanup if necessary
13
        .....
14
15
        def load(self, args):
16
             .....
17
            Ignores all provided arguments and instantiate a DummyService that
18
            is returned to the core
19
            .....
20
            logger.info('dummy loaded')
21
            self._service = DummyService()
22
            return self._service
23
24
        def unload(self):
25
            logger.info('dummy unloaded')
26
27
28
   class DummyService(object):
29
        .....
30
        A very dumb service that will return an empty list every time it is used
31
        .....
32
```

```
34
35
36
37
38
39
```

33

```
def list(self):
    """
    This function must be called explicitly from the view, `list` is not a
    special method name for xivo-dird
    """
    return []
```

View

View plugins add new routes to the HTTP application in xivo-dird, in particular the REST API of xivo-dird: they define the URLs to which xivo-dird will respond and the formatting of data received and sent through those URLs.

For example, we can define a REST API formatted in JSON with one view and the same API formatted in XML with another view. Supporting the directory function of a phone is generally a matter of adding a new view for the format that the phone consumes.

Implementation details

- Namespace: xivo_dird.views
- Abstract view plugin: BaseViewPlugin
- Methods:
 - load (args): set up resources used by the plugin, depending on the config. Typically, register routes on Flask. Those routes would typically call a service. args is a dictionary containing:
 - * key config: the section of the configuration file for all views in dict form
 - * key services: a dictionary of services, indexed by name, which may be called from a route
 - * key http_app: the Flask application instance
 - * key rest_api: a Flask-RestFul Api instance
 - unload(): free resources used by the plugin.

Example

The following example adds a simple view: GET /0.1/directories/ping answers {"message": "pong"}.

dummy.py:

```
-*- coding: utf-8 -*-
   #
1
2
   import logging
3
4
   from flask_restful import Resource
5
6
   logger = logging.getLogger(___name___)
7
8
9
   class PingViewPlugin(object):
10
11
        name = 'ping'
12
13
14
        def __init__(self):
15
            logger.debug('dummy view created')
16
```

```
def load(self, args):
            logger.debug('dummy view args: %s', args)
            args['rest_api'].add_resource(PingView, '/0.1/directories/ping')
20
21
       def unload(self):
22
            logger.debug('dummy view unloaded')
23
24
   class PingView(Resource):
26
        .....
27
       Simple API using Flask-Restful: GET /0.1/directories/ping answers "pong"
        .....
30
       def get(self):
31
           return {'message': 'pong'}
```

Stock Plugins Documentation

View Plugins

17

18 19

25

28

29

32

default_json

View name: default_json

Purpose: present directory entries in JSON format.

headers

View name: headers

Purpose: List headers that will be available in results from default_json view.

personal view

View name: personal_view Purpose: Expose REST API to manage personal contacts (create, delete, list).

phonebook_view

View name: phonebook_view Purpose: Expose REST API to manage xivo-dird's internal phonebooks.

aastra_view

View name: aastra_view Purpose: Expose REST API to search in configured directories for Aastra phone.

cisco_view

View name: cisco_view

Purpose: Expose REST API to search in configured directories for Cisco phone (see CiscoIP-Phone_XML_Objects).

polycom_view

View name: polycom_view

Purpose: Expose REST API to search in configured directories for Polycom phone.

snom_view

View name: snom_view Purpose: Expose REST API to search in configured directories for Snom phone.

thomson_view

View name: thomson_view

Purpose: Expose REST API to search in configured directories for Thomson phone.

yealink_view

View name: yealink_view

Purpose: Expose REST API to search in configured directories for Yealink phone.

Service Plugins

lookup

Service name: lookup

Purpose: Search through multiple data sources, looking for entries matching a word.

Configuration

Example (excerpt from the main configuration file):

```
1 services:
2 lookup:
3 default:
4 sources:
5 - my_csv
6 timeout: 0.5
```

The configuration is a dictionary whose keys are profile names and values are configuration specific to that profile.

For each profile, the configuration keys are:

sources The list of source names that are to be used for the lookup

timeout The maximum waiting time for an answer from any source. Results from sources that take longer to answer are ignored. Default: no timeout.

favorites

Service name: favorites

Purpose: Mark/unmark contacts as favorites and get the list of all favorites.

personal

Service name: personal Purpose: Add, delete, list personal contacts of users.

phonebook

Service name: phonebook

Purpose: Add, delete, list phonebooks and phonebook contacts.

Configuration

3

5

6

Example (excerpt from the main configuration file):

```
1
   services:
2
       favorites:
           default:
4
               sources:
                    - my_csv
                timeout: 0.5
```

The configuration is a dictionary whose keys are profile names and values are configuration specific to that profile.

For each profile, the configuration keys are:

sources The list of source names that are to be used for the lookup

timeout The maximum waiting time for an answer from any source. Results from sources that take longer to answer are ignored. Default: no timeout.

reverse

Service name: reverse

Purpose: Search through multiple data sources, looking for the first entry matching an extension.

Configuration

Example:

```
services:
1
       reverse:
2
            default:
3
                sources:
4
                     - my_csv
5
                 timeout: 1
6
```

The configuration is a dictionary whose keys are profile names and values are configuration specific to that profile.

For each profile, the configuration keys are:

- sources The list of source names that are to be used for the reverse lookup
- **timeout** The maximum waiting time for an answer from any source. Results from sources that take longer to answer are ignored. Default: 1.

Back-end Configuration

This sections completes the Sources Configuration section.

csv

Back-end name: csv

Purpose: read directory entries from a CSV file.

Limitations:

• the CSV delimiter is not configurable (currently: , (comma)).

Configuration

Example (a file inside source_config_dir):

```
type: csv
1
   name: my_csv
2
   file: /var/tmp/test.csv
3
   unique_column: id
4
   searched_columns:
5
       – fn
6
       - ln
7
   first_matched_columns:
8
       – num
9
   format_columns:
10
       lastname: "{ln}"
11
       firstname: "{fn}"
12
       number: "{num}"
13
```

With the CSV file:

```
    id, fn, ln, num
    1, Alice, Abrams, 55553783147
    2, Bob, Benito, 5551354958
    3, Charles, Curie, 5553132479
```

file the absolute path to the CSV file

CSV web service

Back-end name: csv_ws

Purpose: search using a web service that returns CSV formatted results.

Given the following configuration, *xivo-dird* would call "https://example.com:8000/ws-phonebook?firstname=alice&lastname=alice" for a lookup for the term "alice".

Configuration

Example (a file inside source_config_dir):

```
type: csv_ws
1
   name: a_csv_web_service
2
  lookup_url: "https://example.com:8000/ws-phonebook"
3
  list_url: "https://example.com:8000/ws-phonebook"
4
   verify_certificate: False
5
   searched_columns:
6
     - firstname
7
     - lastname
8
   first_matched_columns:
9
10
       - exten
   delimiter: ","
11
   timeout: 16
12
   unique_column: id
13
   format columns:
14
       number: "{exten}"
15
```

lookup_url the URL used for directory searches.

list_url (optional) the URL used to list all available entries. This URL is used to retrieve favorites.

verify_certificate (optional) whether the SSL cert will be verified. A CA_BUNDLE path can also be provided. Defaults to True.

delimiter (optional) the field delimiter in the CSV result. Default: ','

timeout (optional) the number of seconds before the lookup on the web service is aborted. Default: 10.

dird_phonebook

back-end name: dird_phonebook

Purpose: search the xivo-dird's internal phonebooks

Configuration:

```
type: dird_phonebook
1
    name: phonebook
2
    db_uri: 'postgresql://asterisk:proformatique@localhost/asterisk'
3
    tenant: default
4
5
    phonebook_id: 42
6
    phonebook_name: main
    first_matched_columns:
7
      - number
8
    searched_columns:
9
10
      - firstname
      - lastname
11
    format columns:
12
        name: "{firstname} {lastname}"
13
```

db_uri the URI of the DB used by xivo-dird to store the phonebook.

tenant the tenant of the phonebook to query.

phonebook_name the name of the phonebook used by this source.

phonebook_id (deprecated, use phonebook_name) the *id* of the phonebook used by this source.

Idap

Back-end name: ldap

Purpose: search directory entries from an LDAP server.

Configuration

Example (a file inside source_config_dir):

```
1
   type: ldap
  name: my_ldap
2
  ldap_uri: ldap://example.org
3
  ldap_base_dn: ou=people,dc=example,dc=org
4
  ldap_username: cn=admin,dc=example,dc=org
5
  ldap_password: foobar
6
   ldap_custom_filter: (l=québec)
7
   unique_column: entryUUID
8
   searched_columns:
9
       - cn
10
   first_matched_columns:
11
       - telephoneNumber
12
   format_columns:
13
14
       firstname: "{givenName}"
       lastname: "{sn}"
15
       number: "{telephoneNumber}"
16
```

ldap_uri the URI of the LDAP server. Can only contains the scheme, host and port part of an LDAP URL.

ldap_base_dn the DN of the entry at which to start the search

ldap_username (optional) the user's DN to use when performing a "simple" bind.

Default to an empty string.

When both ldap_username and ldap_password are empty, an anonymous bind is performed.

ldap_password (optional) the password to use when performing a "simple" bind.

Default to an empty string.

ldap_custom_filter (optional) the custom filter is used to add more criteria to the filter generated by the back end.

Example:

- ldap_custom_filter: (l=québec)
- searched_columns: [cn,st]

will result in the following filter being used for searches. (& (l=québec) (| (cn=*%Q*)))

If only the custom filter is to be used, leave the searched_columns field empty.

This must be a valid LDAP filter, where the string Q will be replaced by the (escaped) search term when performing a search.

Example: (& (o=ACME) (cn=*%Q*))

ldap_network_timeout (optional) the maximum time, in second, that an LDAP network operation can take. If it takes more time than that, no result is returned.

Defaults to 0.3.

ldap_timeout (optional) the maximum time, in second, that an LDAP operation can take.

Defaults to 1.0.

unique_column (optional) the column that contains a unique identifier of the entry. This is necessary for listing and identifying favorites.

For OpenLDAP, you should set this option to "entryUUID".

For Active Directory, you should set this option to "objectGUID" and also set the "unique_column_format" option to "binary_uuid".

unique_column_format (optional) the unique column's type returned by the queried LDAP server. Valid values are "string" or "binary_uuid".

Defaults to "string".

phonebook

Back-end name: phonebook

Purpose: search directory entries from a XiVO phone book.

Configuration

Example (a file inside source_config_dir):

```
type: phonebook
   name: my_phonebook
2
  phonebook_url: https://example.org/service/ipbx/json.php/restricted/pbx_services/
3
   ⇔phonebook
  phonebook_username: admin
4
   phonebook_password: foobar
5
   first_matched_columns:
6
       - phonebooknumber.office.number
7
       - phonebooknumber.mobile.number
8
9
   format_columns:
       firstname: "{phonebook.firstname}"
10
       lastname: "{phonebook.lastname}"
11
       number: "{phonebooknumber.office.number}"
12
```

phonebook_url (optional) the phonebook's URL.

Default to http://localhost/service/ipbx/json.php/private/pbx_services/phonebook.

The URL to use differs depending on if you are accessing the phone book locally or remotely:

- Local: http://localhost/service/ipbx/json.php/private/pbx_services/ phonebook
- Remote: https://example.org/service/ipbx/json.php/restricted/ pbx_services/phonebook

phonebook_username (optional) the username to use in HTTP requests.

No HTTP authentication is tried when phonebook_username or phonebook_password are empty.

phonebook_password (optional) the password to use in HTTP requests.

phonebook_timeout (optional) the HTTP request timeout, in seconds.

Defaults to 1.0.

To be able to access the phone book of a remote XiVO, you must create a web services access user (*Configuration* -> *Web Services Access*) on the remote XiVO.

personal

Back-end name: personal

Purpose: search directory entries among users' personal contacts

You should only have one source of type personal, because only one will be used to list personal contacts. The personal backend needs a working Consul installation. This backend works with the personal service, which allows users to add personal contacts.

The complete list of fields is in Personal contacts.

Configuration

Example (a file inside source_config_dir):

```
type: personal
1
2
  name: personal
   first_matched_columns:
3
       - number
4
5
   format_columns:
       firstname: "{firstname}"
6
       lastname: "{lastname}"
7
       number: "{number}"
8
```

unique_column is not configurable, its value is always id.

xivo

Back-end name: xivo

Purpose: add users from a XiVO (may be remote) as directory entries

Configuration

Example (a file inside source_config_dir):

```
type: xivo
1
   name: my_xivo
2
   confd_config:
3
       https: True
4
       host: xivo.example.com
5
       port: 9486
6
       version: 1.1
7
       username: admin
8
       password: password
9
       timeout: 3
10
11
   unique_column: id
12
   first_matched_columns:
13
       - exten
   searched_columns:
14
        - firstname
15
       - lastname
16
   format_columns:
17
       number: "{exten}"
18
       mobile: "{mobile_phone_number}"
19
```

confd_config:host the hostname of the XiVO (more precisely, of the xivo-confd service)

confd_config:port the port of the xivo-confd service (usually 9486)

confd_config:version the version of the xivo-confd API (should be 1.1)

Integration of XiVO dird with the rest of XiVO

Configuration values

Views

In the directory displays (also in the *main configuration file* of xivo-dird, in the views section), the following keys are interpreted and displayed in xlet people of the XiVO Client:

title The title will be shown as a header for the column

type

- agent: the field value will be ignored and replaced by an icon showing the status of the agent assigned to the contact (e.g. green icon for logged agent, red icon for unlogged agent, ...)
- callable: a dropdown action on the number field will be added to call the field value.
- email: a dropdown action on the number field will be added to send an email to the field value.
- favorite: the boolean field value will be replaced by an icon showing if the status is favorite (yellow star filled) or not (yellow star empty).
- name: a decoration will be added to the field value (typically a color dot) showing the presence status of the contact (e.g. Disconnected, Available, Away, ...)
- number: only one number type can be defined per profile. The field value will be:
 - added a decoration (typically a color dot) showing the status of the phone of the contact (e.g. Offline, Ringing, Talking, ...)
 - replaced with a button to call the contact with your phone when using the mouse
- personal: the boolean field value will be used to show a deletion action for the contact
- voicemail: the voicemail number of the contact

Personal contacts

Here are the list of available attributes of a personal contact:

- id
- company
- email
- fax
- firstname
- lastname
- mobile
- number

To be able to edit and delete personal contacts, you need a column of type personal in your display.

Adding the personal column to your display

In the web interface under Services \rightarrow CTI Server \rightarrow Directories \rightarrow Display filters.

- 1. Edit the filter on which you which to enable favorites.
- 2. Add a column with the type *personal* and display format *personal*.

Favorites

Enabling favorites in the XiVO client.

- Add a *unique_column* to your sources.
- Add a favorite column to your display

Adding a unique_column to your sources

The web interface does not allow the administrator to specify the *unique_column* and *unique_column_format*. To add these configuration options, add a file to */etc/xivo-dird/sources.d* containing *the same name* than the directory definition and all missing fields.

Example:

Given an *ldap* directory source using Active Directory named myactivedirectory:

| CTI Server | | |
|--|--|---|
| | Definitions > Update directories | |
| General settings General Profiles Status Presences Phone hints Directories Definitions Reverse directories Direct directories Direct directories | Name: myactivedirectory UR: Magnitisr/ind-show-room Delimiter: | |
| Sheets | La construction de la constructi | ٠ |
| Models Events | lastname (sn) | 8 |
| | mobilephonenumber (mobile) | 8 |
| | phone {telephoneNumber} | × |
| | mail (mail) | × |
| | company {company} | × |
| | firstname (giverName) | ۲ |
| | directory | × |
| | nom (givenName) (sn) | × |
| | Description ActiveDirectocy You need to restart the Dird server to apply changes. | |

Add a file /etc/xivo-dird/sources.d/myactivedirectory.yml with the following content to enable favorites on this source.

```
name: myactivedirectory # the same name than the directory definition
unique_column: objectGUID
unique_column_format: binary_uuid
```

Adding the favorite column to your display

In the web interface under Services \rightarrow CTI Server \rightarrow Directories \rightarrow Display filters.

- 1. Edit the filter on which you which to enable favorites.
- 2. Add a column with the type *favorite* and display format *favorite*.

Customizing sources

Some configuration options are not available in the web interface. To add configuration to a source that is configured in the web interface, create a file in */etc/xivo-dird/sources.d/* with the key *name* matching your web interface configuration and add all missing fields.

Example:

adding a timeout configuration to a CSV web service source

```
name: my_csv_web_service
timeout: 16
```

Launching xivo-dird

```
usage: xivo-dird [-h] [-c CONFIG_FILE] [-d] [-f] [-l LOG_LEVEL] [-u USER]
optional arguments:
                       show this help message and exit
 -h, --help
 -c CONFIG_FILE, --config-file CONFIG_FILE
                      The path where is the config file. Default: /etc/xivo-dird/
⇔config.yml
 -d, --debug
                       Log debug messages. Overrides log_level. Default:
                       False
 -f, --foreground
                       Foreground, don't daemonize. Default: False
 -1 LOG_LEVEL, --log-level LOG_LEVEL
                       Logs messages with LOG_LEVEL details. Must be one of:
                       critical, error, warning, info, debug. Default: info
  -u USER, --user USER The owner of the process.
```

Terminology

Back-end

A back-end is a connector to query a specific type of directory, e.g. one back-end to query LDAP servers, another back-end to query CSV files, etc.

Source

A source is an instance of a back-end. One backend may be used multiples times to query multiple directories of the same type. For example, I could have the customer-csv and the employee-csv sources, each using the CSV back-end, but reading a different file.

Plugins

A plugin is an extension point in xivo-dird. It is a way to add or modify the functionality of xivo-dird. There are currently three types of plugins:

- Back-ends to query different types of directories (LDAP, CSV, etc.)
- Services to provide different directory actions (lookup, reverse lookup, etc.)

• Views to expose directory results in different formats (JSON, XML, etc.)

API

See http://MY_XIVO/api, section XiVO Dird.

XiVO dird phoned

xivo-dird-phoned is an interface to use directory service with phone. It offers a simple REST interface to authenticate a phone and search result from *XiVO dird*.

Usage

xivo-dird-phoned is used through HTTP requests, using HTTP and HTTPS. Its default port is 9498 and 9499. As a user, the common operation is to search through directory from a phone. The phone need to send 2 informations:

- *xivo_user_uuid*: The XiVO user uuid that the phone is associated. It's used to search through personal contacts (see *personal*).
- profile: The profile that the user is associated. It's used to format results as configured.

Note: Since most phones dont't support HTTPS, a small protection is to configure authorized_subnets in *Configuration Files* or in *Services* \rightarrow *General settings* \rightarrow *Phonebook* \rightarrow *Hosts*

Launching xivo-dird-phoned

On command line, type xivo-dird-phoned -h to see how to use it.

Purge Logs

Keeping records of personal communications for long periods may be subject to local legislation, to avoid personal data retention. Also, keeping too many records may become resource intensive for the server. To ease the removal of such records, xivo-purge-db is a process that removes old log entries from the database. This allows keeping records for a maximum period and deleting older ones.

By default, xivo-purge-db removes all logs older than a year (365 days). xivo-purge-db is run nightly.

Note: Please check the laws applicable to your country and modify days_to_keep (see below) in the configuration file accordingly.

Tables Purged

The following features are impacted by xivo-purge-db:

- Call Logs
- Switchboard Statistics

More technically, the tables purged by xivo-purge-db are:

- call_log
- cel

- queue_log
- stat_agent_periodic
- stat_call_on_queue
- stat_queue_periodic
- stat_switchboard_queue

Configuration File

We recommend to override the setting days_to_keep from /etc/xivo-purge-db/config.yml in a new file in /etc/xivo-purge-db/conf.d/.

Warning: Setting days_to_keep to 0 will NOT disable xivo-purge-db, and will remove ALL logs from your system.

See *Configuration priority* and /etc/xivo-purge-db/config.yml for more details.

Manual Purge

It is possible to purge logs manually. To do so, log on to the target XiVO server and run:

xivo-purge-db

You can specify the number of days of logs to keep. For example, to purge entries older than 365 days:

```
xivo-purge-db -d 365
```

Usage of xivo-purge-db:

Maintenance

After an execution of xivo-purge-db, postgresql's Autovacuum Daemon should perform a VACUUM ANA-LYZE automatically (after 1 minute). This command marks memory as reusable but does not actually free disk space, which is fine if your disk is not getting full. In the case when xivo-purge-db hasn't run for a long time (e.g. upgrading to 15.11 or when *days_to_keep* is decreased), some administrator may want to perform a VACUUM FULL to recover disk space.

Warning: VACUUM FULL will require a service interruption. This may take several hours depending on the size of purged database.

You need to:

```
$ xivo-service stop
$ sudo -u postgres psql asterisk -c "VACUUM (FULL)"
$ xivo-service start
```

Archive Plugins

In the case you want to keep archives of the logs removed by xivo-purge-db, you may install plugins to xivo-purge-db that will be run before the purge.

XiVO does not provide any archive plugin. You will need to develop plugins for your own need. If you want to share your plugins, please open a pull request.

Archive Plugins (for Developers)

Each plugin is a Python callable (function or class constructor), that takes a dictionary of configuration as argument. The keys of this dictionary are the keys taken from the configuration file. This allows you to add plugin-specific configuration in /etc/xivo-purge-db/conf.d/.

There is an example plugin in the xivo-purge-db git repo.

Example

Archive name: sample

Purpose: demonstrate how to create your own archive plugin.

Activate Plugin

Each plugin needs to be explicitly enabled in the configuration of xivo-purge-db. Here is an example of file added in /etc/xivo-purge-db/conf.d/:

sample.py

1

3

4

5

The following example will be save a file in /tmp/xivo_purge_db.sample with the following content:

```
Save tables before purge. 365 days to keep!
```

Install sample plugin

The following setup.py shows an example of a python library that adds a plugin to xivo-purge-db:

```
1 #!/usr/bin/env python
2 # -*- coding: utf-8 -*-
3
4 from setuptools import setup
5 from setuptools import find_packages
6
7
```

```
setup(
8
        name='xivo-purge-db-sample-plugin',
9
        version='0.0.1',
10
11
        description='An example program',
12
        packages=find_packages(),
13
         entry_points={
14
             'xivo_purge_db.archives': [
15
                  'sample = xivo_purge_db_sample.sample:sample_plugin',
16
             ],
17
         }
18
    )
```

XiVO service

XiVO has many running services. To restart the whole stack, the xivo-service command can be used to make sure the service is restarted in the right order.

Usage

19

Show all services status:

xivo-service status

Stop XiVO services:

```
xivo-service stop
```

Start XiVO services:

xivo-service start

Restart XiVO services:

```
xivo-service restart
```

The commands above will only act upon XiVO services. Appending an argument all will also act upon nginx and postgresql. Example:

xivo-service restart all

UDP port 5060 will be closed while services are restarting.

XiVO sysconfd

xivo-sysconfd is the system configuration server for XiVO. It does quite a few different things; here's a non exhaustive list:

- configuring network (interfaces, hostname, DNS)
- configuring high availability
- staring/stopping/restarting services
- · reloading asterisk configuration
- sending some events to components (xivo-agentd, xivo-agid and xivo-ctid)

Configuration File

Default location: /etc/xivo/sysconfd.conf. Format: INI.

The default location may be overwritten by the command line options.

Here's an example of the configuration file:

```
[general]
xivo_config_path = /etc/xivo
templates_path = /usr/share/xivo-sysconfd/templates
custom_templates_path = /etc/xivo/sysconfd/custom-templates
backup_path = /var/backups/xivo-sysconfd
[resolvconf]
hostname_file = /etc/hostname
hostname_update_cmd = /etc/init.d/hostname.sh start
hosts_file = /etc/hosts
resolvconf file = /etc/resolv.conf
[network]
interfaces_file = /etc/network/interfaces
[wizard]
templates_path = /usr/share/xivo-config/templates
custom_templates_path = /etc/xivo/custom-templates
[commonconf]
commonconf_file = /etc/xivo/common.conf
commonconf_generate_cmd = /usr/sbin/xivo-create-config
commonconf_update_cmd = /usr/sbin/xivo-update-config
commonconf_monit = /usr/sbin/xivo-monitoring-update
[openssl]
certsdir = /var/lib/xivo/certificates
[monit]
monit_checks_dir = /usr/share/xivo-monitoring/checks
monit_conf_dir = /etc/monit/conf.d
[request_handlers]
synchronous = false
[bus]
username = guest
password = guest
host = localhost
port = 5672
exchange_name = xivo
exchange_type = topic
exchange_durable = true
```

request_handlers section

synchronous If this option is true, when xivo-sysconfd receives a request to reload the dialplan for example, it will wait for the dialplan reload to complete before replying to the request.

When this option is false, xivo-sysconfd reply to the request immediately.

By default, this option is set to false to speed up some operations (for example, editing a user from the web interface or from xivo-confd), but this means that there will be a small delay (up to a few seconds in the worst case) between the time you create your user and the time you can dial successfully its extension.

4.1.2 High Availability (HA)

The HA (High Availability) solution in XiVO makes it possible to maintain basic telephony function whether your main XiVO server is running or not. When running a XiVO HA cluster, users are guaranteed to never experience a downtime of more than 5 minutes of their basic telephony service.

The HA solution in XiVO is based on a 2-nodes "master and slave" architecture. In the normal situation, both the master and slave nodes are running in parallel, the slave acting as a "hot standby", and all the telephony services are provided by the master node. If the master fails or must be shutdown for maintenance, then the telephony devices automatically communicate with the slave node instead of the master one. Once the master is up again, the telephony devices failback to the master node. Both the failover and the failback operation are done automatically, i.e. without any user intervention, although an administrator might want to run some manual operations after failback as to, for example, make sure any voicemail messages that were left on the slave are copied back to the master.

Prerequisites

The HA in XiVO only works with telephony devices (i.e. phones) that support the notion of a primary and backup telephony server.

- Phones must be able to reach the master and the slave
- Master and Slave nodes must be in the same subnet
- If firewalling, the master must be allowed to join the slave on ports 22 and 5432
- If firewalling, the slave must be allowed to join the master with an ICMP ping
- Trunk registration timeout (expiry) should be less than 300 seconds (5 minutes)
- The slave must have **no** provisioning plugins installed.

The HA solution is guaranteed to work correctly with the following devices.

Quick Summary

- You need two configured XiVO (wizard passed)
- Configure one XiVO as a master -> setup the slave address (VoIP interface)
- Restart services (xivo-service restart) on master
- Configure the other XiVO as a slave -> setup the master address (VoIP interface)
- Configure file synchronization by runnning the script xivo-sync -i on the master
- Start configuration synchronization by running the script xivo-master-slave-db-replication <slave_ip> on the master
- · Resynchronize all your devices
- Configure the XiVO Clients

That's it, you now have a HA configuration, and every hour all the configuration done on the master will be reported to the slave.

Configuration Details

First thing to do is to install 2 XiVO.

Important: When you upgrade a node of your cluster, you must also upgrade the other so that they both are running the same version of XiVO. Otherwise, the replication might not work properly.

Warning: If your XiVO is interconnected with a XiVO CC, you **MUST** re-configure postres to accept connections from XiVO CC - see *PostgreSQL configuration section*

You must configure the HA in the Web interface (*Configuration* \rightarrow *Management* \rightarrow *High Availability* page).

You can configure the master and slave in whatever order you want.

You must also run xivo-sync -i on the master to setup file synchronization. Running xivo-sync -i will create a passwordless SSH key on the master, stored under the /root/.ssh directory, and will add it to the /root/.ssh/authorized_keys file on the slave. The following directories will then be rsync'ed every hour:

- /etc/asterisk/extensions_extra.d
- /etc/xivo/asterisk
- /var/lib/asterisk/agi-bin
- /var/lib/asterisk/moh
- /var/lib/xivo/certificates
- /var/lib/xivo/sounds/acd
- /var/lib/xivo/sounds/playback

Warning: When the HA is configured, some changes will be automatically made to the configuration of XiVO.

SIP expiry value on master and slave will be automatically updated:

- min: 3 minutes
- max: 5 minutes
- default: 4 minutes

The provisioning server configuration will be automatically updated in order to allow phones to switch from XiVO power failure.

Warning: Do not change these values when the HA is configured, as this may cause problems. These values will be reset to blank when the HA is disabled.

Important: For the telephony devices to take the new proxy/registrar settings into account, you must *resynchronize the devices* or restart them manually.

Disable node

Default status of HIGH AVAILABILITY (HA) is disabled:

Warning: You should not disable an HA node in production as it will break the configuration and restart some services.

Important: You have to restart services (xivo-service restart) once the master node is disabled.

| SIP Protocol properties | |
|--|---|

Fig. 4.18: HA Dashboard Disabled (default state)

Master node

In choosing the method Master you must enter the IP address of the VoIP interface of the slave node.

| Configuration | High Availability | | |
|---|-------------------|--------------------|-------------|
| Management Users Entities | – Slave – | Type of this node: | Master • |
| General Directories Web Services Access Certificates | Slave | Remote address: | 192.168.1.2 |
| High Availability LDAP Servers Network | SAVE | | |

Fig. 4.19: HA Dashboard Master

Important: You have to restart all services (xivo-service restart) once the master node is configured.

Slave node

In choosing the method Slave you must enter the IP address of the VoIP interface of the master node.

| Configuration | High Availability | |
|---|-----------------------------|--|
| Management Users Entities General | Type of this node: Slave | |
| Directories Web Services Access Certificates High Availability | Remote address: 192.168.1.1 | |
| LDAP Servers Network | SAVE | |

Replication Configuration

Once master slave configuration is completed, XiVO configuration is replicated from the master node to the slave every hour (:00).

Replication can be started manually by running the replication scripts on the master:

```
xivo-master-slave-db-replication <slave_ip>
xivo-sync
```

The replication does not copy the full XiVO configuration of the master. Notably, these are excluded:

- All the network configuration except DHCP configuration (i.e. everything under the *Configuration* → *Network* → {*Interfaces, Resolver, Mail*} sections)
- All the support configuration (i.e. everything under the *Configuration* \rightarrow *Support* section)
- Call logs
- · Call center statistics
- Certificates
- HA settings
- Provisioning configuration
- Voicemail messages

Less importantly, these are also excluded:

- Queue logs
- CELs

XiVO Client

You have to enter the master and slave address in the Connection tab of the XiVO Client configuration :

The main server is the master node and the backup server is the slave node.

When connecting the XiVO Client with the main server down, the login screen will hang for 3 seconds before connecting to the backup server.

Internals

4 scripts are used to manage services and data replication.

- xivo-master-slave-db-replication <slave_ip> is used on the master to replicate the master's data on the slave server. It runs on the master.
- xivo-manage-slave-services {start, stop} is used on the slave to start, stop monit and asterisk. The services won't be restarted after an upgrade or restart.
- xivo-check-master-status <master_ip> is used to check the status of the master and enable or disable services accordingly.
- xivo-sync is used to sync directories from master to slave.

Limitations

Architecture:

• Since DHCP parameters are replicated, Master and Slave node MUST be on the same VoIP network.

When the master node is down, some features are not available and some behave a bit differently. This includes:

| | | | XiVO Clie | nt Configuration | | | | × |
|-------|-----------|----------------|-----------|------------------|------|----------------|----------|---|
| User | Features | Administration | Advanced | | | | | |
| Serve | er | 192.168.32.177 | | | Port | 5003 | | |
| Backu | up server | 192.168.32.193 | | | Port | 5003 | - | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | | | |
| | | | | | | <u>C</u> ancel | <u> </u> | |

- Call history / call records are not recorded.
- Voicemail messages saved on the master node are not available.
- Custom voicemail greetings recorded on the master node are not available.
- Phone provisioning is disabled, i.e. a phone will always keep the same configuration, even after restarting it.
- Phone remote directory is not accessible, because provisioned IP address points to the master.

Note that, on failover and on failback:

- DND, call forwards, call filtering, ..., statuses may be lost if changed recently.
- If you are connected as an agent, then you might need to reconnect as an agent when the master goes down. Since it's hard to know when the master goes down, if your CTI client disconnects and you can't reconnect it, then it's a sign the master might be down.

Additionally, only on failback:

- Voicemail messages are not copied from the slave to the master, i.e. if someone left a message on your voicemail when the master was down, you won't be able to consult it once the master is up again.
- More generally, custom sounds are not copied back. This includes recordings.

Here's the list of limitations that are more relevant on an administrator standpoint:

• The master status is up or down, there's no middle status. This mean that if Asterisk is crashed the XiVO is still up and the failover will NOT happen.

Berofos Integration

Berofos Integration

XiVO offers the possibility to integrate a berofos failover switch within a HA cluster.

This is useful if you have one or more ISDN lines (i.e. T1/E1 or T0 lines) that you want to use whatever the state of your XiVO HA cluster. To use a berofos within your XiVO HA installation, you need to properly configure both your berofos and your XiVOs, then the berofos will automatically switch your ISDN lines from your master node to your slave node if your master goes down, and vice-versa when it comes back up.

You can also use a Berofos failover switch to secure the ISDN provider lines when installing a XiVO in front of an existing PBX. The goal of this configuration is to mitigate the consequences of an outage of the XiVO : with this equipment the ISDN provider links could be switched to the PBX directly if the XiVO goes down.

XiVO **does not offer natively** the possibility to configure Berofos in this failover mode. The *Berofos Integration with PBX* section describes a workaround.

Installation and Configuration

Master Configuration

There is nothing to be done on the master node.

Slave Configuration

First, install the bntools package:

```
apt-get install bntools
```

This will make the bnfos command available.

You can then connect your berofos to your network and power it on. By default, the berofos will try to get an IP address via DHCP. If it is not able to get such address from a DHCP server, it will take the 192.168.0.2/24 IP address.

Note: The DHCP server on XiVO does not offer IP addresses to berofos devices by default.

Next step is to create the /etc/bnfos.conf file via the following command:

```
bnfos --scan -x
```

If no berofos device is detected using this last command, you'll have to explicitly specify the IP address of the berofos via the -h option:

```
bnfos --scan -x -h <berofos ip>
```

At this stage, your /etc/bnfos.conf file should contains something like this:

```
[fos1]
mac = 00:19:32:00:12:1D
host = 10.34.1.50
#login = <user>:<password>
```

It is advised to configure your berofos with a static IP address. You first need to put your berofos into *flash mode* :

- press and hold the black button next to the power button,
- power on your berofos,
- release the black button when the red LEDs of port D start blinking.

Then, you can issue the following command, by first replacing the network configuration with your one:

bnfos --netconf -f fos1 -i 10.34.1.20 -n 255.255.255.0 -g 10.34.1.1 -d 0

Note:

- -i is the IP address
- -n is the netmask
- -g is the gateway
- -d 0 is to disable DHCP

You can then update your berofos firmware to version 1.53:

```
wget http://www.beronet.com/downloads/berofos/bnfos_v153.bin
bnfos --flash bnfos_v153.bin -f fos1
```

Once this is done, you'll have to reboot your berofos in operationnal mode (that is in normal mode).

Then you must rewrite the /etc/bnfos.conf (mainly if you changed the IP address):

bnfos --scan -x -h <berofos ip>

Now that your berofos has proper network configuration and an up to date firmware, you might want to set a password on your berofos:

```
bnfos --set apwd=<password> -f fos1
bnfos --set pwd=1 -f fos1
```

You must then edit the /etc/bnfos.conf and replace the login line to something like:

login = admin:<password>

Next, configure your berofos for it to work correctly with the XiVO HA:

```
bnfos --set wdog=0 -f fos1
bnfos --set wdogdef=0 -f fos1
bnfos --set scenario=0 -f fos1
bnfos --set mode=1 -f fos1
bnfos --set modedef=1 -f fos1
```

This, among other things, disable the watchdog. The switching from one relay mode to the other will be done by the XiVO slave node once it detects the master node is down, and vice-versa.

Finally, you can make sure everything works fine by running the xivo-berofos command:

```
xivo-berofos master
```

The green LEDs on your berofos should be lighted on ports A and B.

Connection

Two XiVOs

Here's how to connect the ISDN lines between your berofos with:

• two XiVOs in high availability

In this configuration you can protect **up two 4** ISDN lines. If more than 4 ISDN lines to protect, you must set up a *Multiple berofos* configuration.

Here's an example with 4 ISDN lines coming from your telephony provider:

Two XiVOs and one PBX

Here's how to connect your berofos with:

- two XiVOs in high availability,
- one PBX.

In this configuration you can protect **up two 2** ISDN lines. If more than 2 ISDN lines to protect, you must set up a *Multiple berofos* configuration.

Logical view:

```
+----+ +----+
-- Provider ----| xivo-1 | -- ISDN Interconnection --| PBX | -- Phones
+----+ +--+
| xivo-2 |
+-----+
```

This example shows the case where there are 2 ISDN lines coming from your telephony provider:

```
ISDN lines (provider)
  | |
  |
  |
  |
  |
  A B C D |
  | 1|2|3|4 1|2 3|4 1|2|3|4 1|2 3|4 |
+-----+
  | CPE | | | NET CPE | | | NET
  | Spans | | | Spans spans | | | Spans
  | +----+
  | | xivo-1 | | xivo-2 |
  | | +----+
  | PBX |
  +----+
```

One XiVO and one PBX

This case is not currently supported. You'll find a workaround in the Berofos Integration with PBX section.

Multiple berofos

It's possible to use more than 1 berofos with XiVO.

For each supplementary berofos you want to use, you must first configure it properly like you did for the first one. The only difference is that you need to add a berofos declaration to the /etc/bnfos.conf file instead of creating/overwriting the file. Here's an example of a valid config file for 2 berofos:

```
[fos1]
mac = 00:19:32:00:12:1D
host = 10.100.0.201
login = admin:foobar
[fos2]
mac = 00:11:22:33:44:55
host = 10.100.0.202
login = admin:barfoo
```

Warning: berofos name must follow the pattern fosX where X is a number starting with 1, then 2, etc. The bnfos tool won't work properly if it's not the case.

Operation

When your XiVO switch the relay mode of your berofos, it logs the event in the /var/log/syslog file.

Default mode

Note that when the berofos is off, the A and D ports are connected together. This behavior is not customizable.

Uninstallation

It is important to remove the /etc/bnfos.conf file on the slave node when you don't want to use anymore your berofos with your XiVOs.

Reset the Berofos

You can reset the berofos configuration :

- 1. Power on the berofos,
- 2. When red and green LEDs are still lit, press & hold the black button,
- 3. Release it when the red LEDs of the D port start blinking fast
- 4. Reboot the beronet, it should have lost its configuration.

External links

• berofos user manual

Troubleshooting

When replicating the database between master and slave, if you encounter problems related to the system locale, see *PostgreSQL localization errors*.

4.2 XiVOcc Administration

4.2.1 System Configuration

ACD Outgoing Calls For Call Blending

Use the following only if you want to use "Least Recent" call distribution strategy and that outbound agent calls have to be taken into account by the distribution strategy.

By default, when your agents process incoming and outgoing calls, the call distribution will not take into account agents which are in outgoing calls in the *least recent* call strategy and at the end of an outgoing call there is no wrapup. So an agent can be distributed just after an outgoing calls even if another agent is free for a longer time, because the outgoing call is not taken into account by the distribution strategy.

You will find below how to improve that.

XiVO-CC agent can make outgoing calls through an outgoing queue. This brings the statistics and supervision visualization for outgoing ACD calls. However, some special configuration steps are required. The outgoing calls must be dialed from CC Agent application to use this feature.

Configuration Steps

- You need to create an outgoing queue with
 - in tab General:
 - * Name: starting with 'out', e.g. outbound,
 - * Number: some number
 - * Music On-Hold: None
 - * Preprocess subroutine: xuc_outcall_acd
 - in tab Application:
 - * Ringing Time: 0
 - * Ring instead of On-Hold music: activated
- Agent will have to be logged on this queue

How to check correct configuration

Check if agent is logged in the outbound queue:

```
jyl-rennes*CLI> queue show outbound
outbound has 0 calls (max unlimited) in 'ringall' strategy (0s holdtime, 0s_
→talktime), W:0, C:0, A:0, SL:0.0% within 0s
Members:
Agent/2500 (Local/id-19@agentcallback from SIP/ihvbur) (ringinuse disabled)_
→ (dynamic) (Not in use) (skills: agent-19) has taken no calls yet
No Callers
```

Check the skills attached to the agent by displaying it's agent group:

```
jyl-rennes*CLI> queue show skills groups agent-19
Skill group 'agent-19':
    agent_19 : 100
    agent_no_2500 : 100
    genagent : 100
```

If the agent dials an outbound call of more than 6 digits (default) you should see the internal queue statistics updated. The agent's state should be "(in call)" for ongoing call and when the call ends, the number of taken calls should be incremented:

```
jyl-rennes*CLI> queue show outbound
outbound has 0 calls (max unlimited) in 'ringall' strategy (0s holdtime, 34s_
→talktime), W:0, C:1, A:0, SL:100.0% within 0s
Members:
Agent/2500 (Local/id-19@agentcallback from SIP/ihvbur) (ringinuse disabled)_
→ (dynamic) (Not in use) (skills: agent-19) has taken 1 calls (last was 1 secs ago)
No Callers
```

Once done, calls requested by an agent through the Cti.js with more than 6 digits are routed via the outgoing queue. You can change the number of digits using the parameter xuc.outboundLength in the XuC's configuration.

Ldap Authentication

Xuc

Configure LDAP authent for CCmanager, UC Assistant and CC Agent

You need to include in the docker-xivocc.yml file a link to a specific configuration file by adding in xuc section a specific volume and an environment variable to specify the alternate config file location

```
xuc:
image: ...
environment:
- ...
- CONFIG_FILE=/conf/xuc.conf
volumes:
- /etc/docker/xuc:/conf
```

Edit in /etc/docker/xuc/ folder a configuration file named xuc.conf to add ldap configuration (empty by default)

```
include "application.conf"
authentication {
 ldap {
   managerDN = "uid=company,ou=people,dc=company,dc=com"
                                                                # user with read_
\hookrightarrowrights on the whole LDAP
   managerPassword = "xxxxxxxxx"
                                                                   # password for this
⇔user
   url = "ldap://ldap.company.com:389"
                                                                   # ldap URI
    searchBase = "ou=people,dc=company,dc=com"
                                                                   # ldap entry to use
\hookrightarrowas search base
   userSearchFilter = "uid=%s"
                                                                   # filter to use to
⇔search users by login, using a string pattern
  }
```

Recreate the container : xivocc-dcomp up -d xuc

Kerberos Authentication

To enable Kerberos authentication and single sign on feature, you need to have an existing Kerberos infrastructure with a Key Distribution Center and a Ticket Granting Service. You need to be able to create a service, construct a kerberos server configuration and export a keytab to perform the following configuration. This service must be on the kerberos realm used by your users and must match the dns name of the server hosting the XUC server (or the nginx reverse proxy server if you use one). For example, assuming you have a realm named MYDOMAIN, you can create a service named HTTP/xuc.mydomain and a dns entry for xuc.mydomain pointing the server hosting the XUC.

Warning: The created domain name must be trusted by the user's browser.

Prerequisites

• Create a service for the XUC host, for example:

addprinc HTTP/xuc.mydomain

• Export the keytab file, for example:

ktadd -k xuc.keytab HTTP/xuc.mydomain

Warning: The bash commands detailed here are for demonstration only and needs to be adapted to your specific environment. It shows how to create a service for the XUC Server named HTTP/xuc, associated to the example realm mydomain.

Only the following encryption types are supported by XiVOCC:

- aes256-cts-hmac-sha1-96
- arcfour-hmac
- des3-cbc-sha1
- des-cbc-crc

XiVOCC Configuration

- Download the Zulu Cryptography Extension Kit from http://www.azulsystems.com/products/zulu/ cryptographic-extension-kit
- Extract the content of the downloaded file ZuluJCEPolicies.zip on the server hosting the XUC docker container in the folder /etc/docker/xuc/ (Folder should contain at least local_policy. jar & US_export_policy.jar files)
- Copy the previously generated xuc.keytab keytab file to the server hosting the XUC docker container, for example: /etc/docker/kerberos/xuc.keytab.
- Create or edit the file /etc/krb5.conf on the server hosting the XUC docker container and change settings according to your kerberos environment. For example, the file may contain (name and ip addresses must match your kerberos environment):

```
[libdefaults]
  default_realm = MYDOMAIN
[realms]
  MYDOMAIN = {
    kdc = 172.17.0.14
    admin_server = 172.17.0.14
  }
```

• Edit the docker compose file /etc/docker/compose/docker-xivocc.yml to add the following configuration in the xuc section (file name, service name, password may differ on your setup):

• Enable Single Sign On on the Agent, Manager, Web and Desktop application interface. Change the value of the following environment variables in the */etc/docker/compose/custom.env*:

```
# ...
USE_SSO=true
XUC_HOST=xuc.mydomain
# ...
```

Browser configuration

The created domain name must be trusted by the user's browser.

For Chrome (windows):

• Internet Option : Add domain with protocol to the list of trusted sites : http://xuc.mydomain (and/or https: //xuc.mydomain).

Warning: Kerberos authentication on Chrome is only available on Microsoft Windows.

For Firefox:

- Go to about : config
- add domain (without protocol) to the network.negotiate-auth.delegation-uris entry (ie. xuc.mydomain).
- add domain (without protocol) to the network.negotiate-auth.trusted-uris entry (ie. xuc. mydomain).

Install trusted certificate for nginx

To install a trusted certificate for the nginx reverse proxy instead of the self signed certificate, follow the following instructions:

- in directory /etc/docker/nginx/ssl replace content of files xivoxc.crt, xivoxc.csr and xivoxc.key while keeping filenames unchanged
- restart nginx container by command xivocc-dcomp restart nginx.

Warning: When configuring the certificate, please ensure the certificate chain is complete, especially for the XiVO Mobile Assistant. You can check the server certificate chain by using the following web site https: //www.ssllabs.com/ssltest/analyze.html which will warn you if there is an error with the certificate (Chain issues - Incomplete)

What is a complete certificate chain

When a client application (browser or mobile application) checks a certificate for a web site, it checks the received certificate is issued by a known certificate authority and matches the web site domain name. But sometimes, the certificate is not issued by a root certificate authority but by an intermediate authority.

Here is an example of a such a certificate chain:

```
GeoTrust Global CA
|--> RapidSSL SHA256 - CA - G3
|--> *.company.com
```

The possible problem here is that even if the browser knows the root authority, it is unaware of the intermediate one. The solution is to create a bundle of the complete certificate chain by concatenating the certificates of all parties (root, intermediate & site). Please see http://nginx.org/en/docs/http/configuring_https_servers.html#chains for more information.

Mobile Assitant

If using an HTTPS connection for the XiVO Mobile Assistant, you must use a trusted certificate with a complete certification chain, see *Install trusted certificate for nginx*.

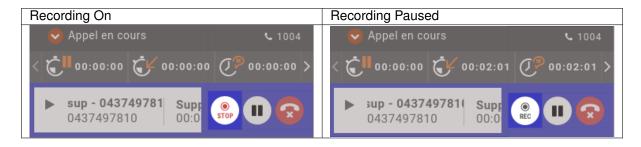

4.2.2 XiVOcc Applications Configuration

This section covers specific configuration parameters for the different application of XiVO CC.

CC Agent configuration

Recording

Recording can be paused or started by an agent.

This feature can be disabled by changing showRecordingControls option in file application.conf. You can also set the environment variable SHOW_RECORDING_CONTROLS to false for your xucmgt container in /etc/docker/compose/custom.env file. When disabled the recording status is not displayed any more

Activity (Queue) control

By using the showQueueControls option in application.conf, you may allow an agent to enter or leave an activity. You can also use SHOW_QUEUE_CONTROLS environment variable in /etc/docker/compose/ custom.env file.

| NAME 🔶 📃 My activities | SUBSCR | . ŠTATUS |
|--------------------------|--------|----------|
| big long queue name with | ж | = |
| Outbound | × | = |
| sales | ~ | = |
| support | ~ | = |
| Switchboard | ж | = |
| Switchboard_hold | × | = |

Pause Cause and Status

You can configure XiVO to have the following scenario:

- The agent person leaves temporarily his office (lunch, break, ...)
- He sets his presence in the CCAgent to the according state
- The agent will be automatically set in pause and his phone will not ring from queues
- He comes back to his office and set his presence to 'Available'
- The pause will be automatically cancelled

| E Agent O | | | L • 1000 |
|---------------|---------------|-----------|--------------------|
| < 🤇 📀 Far A | way po | :00 | 00:00:00 > |
| 🗾 📀 Parti | Manger | | |
| 🕑 Logg | ed Out | Ü | Ü |
| History Activ | vities Agents | Callbacks | s Customer |
| | SEARCH OR C | ALL | Q |

By default the pause action from the agent cannot be specified with a specific cause such as Lunch Time, or Tea Time. To be able to use a specific cause, you will have to define new Presences in the cti server configuration.

| CTI Server | + | | | |
|----------------------------------|---|---------------|-------------------|--------------|
| General settings General | | Presence Name | Description | Action |
| Profiles | | berightback | Bientôt de retour | |
| tatus resences | | erreursaisie | Erreur Saisie | |
| none hints | | postappel | Autre Travail | Ø 😣 |
| efinitions | | away | Sorti | Ø 🕱 |
| everse directories | | outtolunch | Parti Manger | Ø 8 |
| ect directories splay filters | | donotdisturb | Ne pas déranger | |
| eets | | disconnected | Déconnecté | \bigotimes |
| dels | | backoffice | Back Off. | Ø 🕱 |
| ents | | chat | Chat | |
| | | available | Disponible | \sim |

You define presences with action **Activate pause to all queue** to **true**, for not ready causes, and you must have one presence defined with an action **Disable pause to all queue** to be able to go back to not ready. When this presences are defined, you must restart the xuc server to be able to use them in ccagent, these presences will also be automatically available in *CCmanager* and new real time counters will be calculated.

| Presence > Edit pre | | |
|---|---|---|
| Presence > Edit presence Presence > Edit | Parameter statistic The human statistic status is to displayed Other statistic status is from this mode Other statistic status is to displayed Other statistic status is from this mode The human statistic status is to displayed The human statistic status is from this mode The human statistic status is to displayed The human statistic status is from this mode The human statistic status is to displayed The human statistic status is from this mode The human statistic status is to displayed The human statistic status is the human statistic statististic statistic statistic | • |

Screen Popup

It is possible to display customer information in an external web application using Xivo sheet mecanism.

- Services > CTI Server > Sheets > Models:
 - Tab General Settings: Give a name
 - Tab Sheet: You must define a sheet with two fields
 - * folderNumber
 - field type = text
 - · It has to be defined. Can be calculated or use a default value not equal to "-"
 - Note: You could leave "empty" using a whitespace (in hexadecimal: %20)
 - * popupUrl
 - \cdot field type = text
 - The url to open when call arrives : i.e. http://mycrm.com/customerInfo?folder= the folder number will be automatically appended at the end of the URL
- Services > CTI Server > Sheets > Events: Choose the right events for opening the URL (if you choose two events, url will opened twice etc.)

Example : Using the caller number to open a customer info web page

- Define folderNumber with any default value i.e. 123456
- Define popupUrl with a display value of http://mycrm.com/customerInfo?nb={xivo-calleridnum}&fn= when call arrives web page http://mycrm.com/customerInfo?nb=1050&fn=123456 will be displayed

| XiVO Services - Configurat | lon About | | | | Login: root Type: Root 🕚 |
|---|--|------------|---------------|---------------|--------------------------|
| CTI Server General settings General Profiles | Models > Update model | | | | |
| Status Presences Phone hints | General settings Sheet Systray Actions | | | | |
| Directories Definitions Reverse directories Direct directories | Disabled: Utimerface: | | | | |
| Display filters | Field title | Field type | Default value | Display value | ٠ |
| Sheets Models | Ø popupUrl | text • | | {dp-url_crm} | ۲ |
| Events | C folderNumber | T | 123456 | %20 | ۲ |

Login and Pause management using function keys

You can configure Login or Pause keys on an agent phone. Their state will be synchronized with the state in *XiVO CC* applications.

Behavior

- Login Key:
 - change status of agent: login if it was logged out, and logout if it was logged in
 - LED of phone key will be updated accordingly as well as the status in *XiVO CC* applications (CCA-gent...)
 - if you login/logout via *XiVO CC* applications (CCAgent...), status will be updated and phone key LED will be updated.
- Pause key:
 - change status of agent: pause if it was ready, ready if it was paused or in wrapup
 - LED of phone key will be updated accordingly as well as the status in *XiVO CC* applications (CCA-gent...)
 - if you pause/unpause via *XiVO CC* applications (CCAgent...), status will be updated and phone key LED will be updated
 - Wrapup: if agent is on wrapup, the phone key will *blink*. If you press key while on wrapup, agent status will be changed to ready

Note:

- * The key blinks on Snom and Yealink phone sets. It doesn't blink on Polycom phone sets.
- * To be able to terminate Wrapup via the key on Snom phones you must use correct version of plugin (see *Plugins release notes*).

Configuration

There are two types of customizable function keys that can be used

- Login: it will toggle login/logout of agent. There are two configuration patterns (see also below):
 - either ***30<PHONE NUMBER>: in this case it will ask for agent number and will then login the given agent on phone <PHONE NUMBER>
 - or ***30<PHONE NUMBER>*<AGENT NUMBER>: in this case it will log agent <AGENT NUMBER> on phone <PHONE NUMBER>
- Pause: it will toggle pause/unpause of agent (and will blink if agent is on Wrapup). Configuration pattern (see also below):
 - ***34<PHONE NUMBER> : it will toggle pause/unpause of agent logged on phone <PHONE NUMBER>

To use it you must:

- 1. On on XiVO PBX edit /etc/xivo-xuc.conf and change variables:
 - XUC_SERVER_IP to IP address of XivoCC
 - XUC_SERVER_PORT to port of XUC Server (default is 8090)
- 2. Configure function key on user (example with user 1000, 1001 and agent 8000 associated to user 1000):
 - Open Services > IPBX > IPBX settings > Users
 - Edit the user, open *Func Keys* tab and add keys like:
 - For Pause/Unpause agent logged on phone 1000 set:
 - Type: Customized,

- *Destination*: ***341000,
- Label: Pause,
- Supervision: Enabled
- For Login/Logout agent on phone 1000 set:
 - Type: Customized,
 - *Destination*: ***301000,
 - Label: Login,
 - Supervision: Enabled
- For Login/Logout agent 8000 on phone 1001 set:
 - Type: Customized,
 - Destination: ***301001*8000,
 - Label: LoginOn1001,
 - *Supervision*: Enabled

Users > Edit | acd05 acd05 - Provisioning: <119688> General Lines No answer Services Voicemail Groups Func Keys Label Supervision Key Туре Destination Ŧ ***341000 X Pause Enabled V 3 Customized × * 4 * Customized ***301000 Login Enabled * v ۳ ***301001*8000 LoginOn1001 Enabled V X 5 Customized

SAVE

CC Manager

See CC Manager features.

Access authorizations in CCManager

Note: Behavior was changed in 2017.LTS1 (see 2017.LTS1 release notes in Release Notes)

By default, CCManager access is authorized only for users with *Administrateur* or *Superviseur* rights (as defined in the Configuration Management server). If required, you can authorize all users to connect to the CCManager interface by setting the ENFORCE_MANAGER_SECURITY environment variable to false in the /etc/docker/compose/custom.env file:

ENFORCE_MANAGER_SECURITY=false

Then you need to recreate the xucserver container with xivocc-dcomp up -d xuc. Then each user will be able to log in the CCM anager. Otherwise, each user that wants to connect to the CCM anager will need to have a *Administrateur* or *Superviseur* profile in the Configuration Management server.

Recording configuration

This page describes how to configure the recording feature for XiVO Solutions. This feature needs some additionnal *installation steps which are described here*.

. . .

Configure recording

To configure recording there are two steps to follow on XiVO PBX:

- 1. Add link towards Recording Server,
- 2. and Enable recording with the subroutines.

1. Add link towards Recording Server

Note: Steps to be done on XiVO PBX

The first step is to configure the link towards the Recording Server by running the configuration script:

xivocc-recording-config

During the configuration, you will be asked for :

- the Recording Server IP (i.e. 192.168.0.2)
- the *XiVO PBX* name (it must not contain any space or "-" character). If you configure more more than one *XiVO PBX* on the same Recording Server, you must give a different name to each of them.

After having configured the recording, you have to enable it via sub-routines. See below.

2. Enable recording with subroutines

Note: Steps to be done on XiVO PBX

To enable the recording you have to configure one of the shipped subroutines.

The package xivocc-recording (see *recording installation section*) ships the following dialplan subroutines :

| Subroutine | Description | |
|--|---|--|
| xivocc-incall-record | Records incoming calls | |
| xivocc-incall-record in Receptates in state and can be activated | | |
| | by the agent (see agent recording configuration) | |
| xivocc-outcall-record | d Reg ords outgoing calls | |
| xivocc-outcall-record | d Regonds wategoing calls, but record starts in paused state and can be activated | |
| | by the agent (see agent recording configuration) | |

These subroutines are to be configured on the following XiVO PBX objects (either globally or per-object):

Warning: They MUST be configured only on the following objects. Other configuration are not supported.

- Incalls,
- and/or Queues,
- and/or Users,
- and/or Outcall

Note: Here is an example if you want to enable recording for:

- All outbound calls but started in pause state,
- All queues,
- And only on incoming call 0123456789

Then you would have to:

- Create a custom_global_subr.conf file in the /etc/asterisk/extensions_extra.d directory
- 2. If not already defined elsewhere define the global subroutine:

```
[xivo-subrgbl-queue]
exten = s,1,NoOp(=== Recording incoming calls ===)
same = n,Gosub(xivocc-incall-recording,s,1)
same = n,Return()
[xivo-subrgbl-outcall]
exten = s,1,NoOp(=== Recording outbound calls in pause ===)
same = n,Gosub(xivocc-outcall-recording-paused,s,1)
same = n,Return()
```

1. Enable the call recording for incall 0123456789 by editing it via the *XiVO PBX* web interface and set the field *Pre-process subroutine* to xivocc-incall-recording

Stop recording upon external transfer

By default recording is stopped when both parties of the call are external.

This can be deactivated by adding STOP_RECORDING_UPON_EXTERNAL_XFER environment variable to the xuc section of your docker-xivocc.yml file:

```
xuc:
image: ...
environment:
- ...
- SECURED_KRB5_PRINCIPAL
- STOP_RECORDING_UPON_EXTERNAL_XFER
```

and STOP_RECORDING_UPON_EXTERNAL_XFER=false value to your custom.env.

```
XIVO_HOST=192.168.1.1
XUC_HOST=192.168.1.2
XUC_PORT=8090
...
STOP_RECORDING_UPON_EXTERNAL_XFER=false
```

and then relaunch the xivocc services with xivocc-dcomp up -d command.

Recording filtering configuration

```
Note: Steps to be done on XiVO CC
```

After having followed above paragraphs, you can also configure the recording filtering.

1. Add a user with Administrateur rights for Recording Server:

- (a) Connect to the Config Management interface : http://<XIVO_CC_IP>:9100 (login avencall/superpass),
- (b) Add one of the XiVO PBX user giving him Administrateur rights,
- 2. Configure excluded numbers on Recording Server
 - (a) Then, connect with this user to the Recording Server interface : http://<XIVO_CC_IP>:9400
 - (b) Navigate to the page Contrôle d'enregistrement and add the numbers to be excluded from the recording.

In list Destinataire de l'appel (Numéro entrant, File d'attente, Utilisateur) declare the:

- XiVO Incalls numbers,
- XiVO Queues numbers,
- or XiVO Users numbers

to be excluded from the recording on incoming or internal call. These numbers will be checked by the xivocc-incall-recording subroutines.

Note: numbers must be entered as they first appear in dialplan (check is made against XIVO_DSTNUM dialplan variable).

In list Emetteur ou destinataire d'un appel sortant (Utilisateur ou numéro appelé externe) declare the:

• XiVO Users internal numbers

to be excluded from recording on outgoing calls. These numbers will be checked by the xivocc-outcall-recording subroutines.

Note: check is made against XIVO_SRCNUM dialplan variable.

Gateway recording configuration

No doc currently

Reporting

Totem Panels

Data replication can take some time if there are a lot of data in xivo cel and queue log tables. You may check xivo-db-replication log files (/var/log/xivocc/xivo-db-replication.log).

Preconfigured panels are available on http://@IP/kibana/#/dashboard/file/queues.json et http://@IP/kibana/#/ dashboard/file/agents.json to be able to save this panels in elasticsearch database you have to sign on on request user admin/Kibana

Defaut data persistance in totem panels is 7 days, you may change this default by defining ELASTICTTL environment variables in xivo-replic section, see below for an example of how to keep 15 days.

```
xivo_replic:
image: xivoxc/xivo-db-replication:latest
links:
- pgxivocc:db
- elasticsearch:elasticsearch
environment:
```

```
- JAVA_OPTS=-Xms256m -Xmx256m
- XIVO_HOST=192.168.250.11
- ELASTICTTL=15
```

Disable Totem Panels

If you do not use pannels and elasticsearch, it is possible to disable then.

You need to edit the docker-xivocc.yml file.

First, in *xivo_replic* section:

- remove or comment the elasticsearch link,
- add elasticsearch as en *extra_host* on 127.0.0.1
- and add the DISABLEELASTIC=true environment variable

```
xivo_replic:
image: xivoxc/xivo-db-replication:latest
links:
- pgxivocc:db
#- elasticsearch:elasticsearch
extra_hosts:
- "elasticsearch:127.0.0.1"
environment:
- JAVA_OPTS=-Xms256m -Xmx256m
- XIVO_HOST=192.168.250.11
- DISABLEELASTIC=true
...
```

Secondly, remove the *elasticsearch* and *kibana_volumes* sections,

Thirdly, in *nginx* section:

- remove or comment the elasticsearch link,
- add elasticsearch as en extra_host on 127.0.0.1
- remove or comment the kibana_volumes

```
nginx:
image: xivoxc/xivoxc_nginx:latest
ports:
- 80:80
links:
#- elasticsearch
- xuc
- xucmgt
extra_hosts:
- "xivo_host:192.168.250.11"
- "elasticsearch:127.0.0.1"
volumes_from:
#- kibana_volumes
- fingerboard
...
```

Web / Desktop Application

Disabling WebRTC

WebRTC can be disabled globally by setting the DISABLE_WEBRTC environment varibale to true in /etc/ docker/compose/custom.env file.

WebRTC configuration

See Web RTC feature description.

Signed SSL/TLS certificate for WebRTC

XivoCC installation generates self-signed SSL/TLS into nginx server running as part of XivoCC. This limits WebRtc usage:

- UC Assistant shows warning about unsecure page and exception must be confirmed by user.
- *Desktop Applications* must be started with --ignore-certificate-errors parameter, which degrades security.

To avoid this, SSL/TLS certificate signed by authority recognized by Chrome in PEM format is required, see *Install trusted certificate for nginx*.

Note: Do **NOT** forget to check that XUC_HOST in /etc/docker/compose/custom.env is also configured with the same FQDN as in the certificate, not the IP address.

4.2.3 XiVOcc Administration

Start, stop or restart containers

Using the *xivocc-dcomp* script, you can control the run of the XiVO CC components:

xivocc-dcomp [command] [container]

List of commands:

- up -d run containers
- stop stop containers
- restart restart containers

If you don't enter container name, the command applies on all containers. Use container names from this *list*.

Show status

xivocc-dcomp ps

Show containers and images versions

Note: Introduced in 2017.03.03 release.

Docker images are labelled with the exact version of the embedded application.

You can display the:

• Version of the running docker containers by typing:

xivocc-dcomp version

• Version of all docker containers (including stopped ones) by typing:

xivocc-dcomp version -a

• Version of docker images:

xivocc-dcomp version -i

For example :

| <pre># xivocc-dcomp version</pre> | |
|--------------------------------------|------------|
| NAMES | VERSION |
| xivocc_nginx_1 | |
| xivocc_xuc_1 | 2017.03.03 |
| <pre>xivocc_recording_server_1</pre> | 2017.03.03 |
| xivocc_xucmgt_1 | 2017.03.03 |
| xivocc_config_mgt_1 | 2017.03.02 |
| <pre>xivocc_pack_reporting_1</pre> | 2017.03.02 |
| xivocc_spagobi_1 | 2017.03.02 |
| xivocc_xivo_stats_1 | 2017.03.02 |
| xivocc_xivo_replic_1 | 2017.03.02 |
| xivocc_pgxivocc_1 | |
| xivocc_elasticsearch_1 | |
| xivocc_fingerboard_1 | |
| <pre>xivocc_recording_rsync_1</pre> | |
| xivocc_kibana_volumes_1 | |

This only applies to the following images:

- config_mgt
- pack_reporting
- recording
- spagobi
- xivo_replic
- xivo_stats
- xuc
- xucmgt

Note: Labels were in fact introduced in 2017.03.02 but in this version you had to use docker commands to display them:

• List all running containers with the exact version of application

```
$ docker ps --format 'table {{.Names}}\t{{.Image}}\t{{.Label "version"}}\t{{.
\hookrightarrowStatus}}'
NAMES
                            IMAGE
                    STATUS
→VERSION

xivocc_fingerboard_1 xivoxc/fingerboard:latest
                                                                 Ξ.
             Up 32 hours
\hookrightarrow
<u>ц</u>
              Up 32 hours
 \rightarrow 
<u>ب</u>
             Up 32 hours
\hookrightarrow
```

• You can also inspect an image or container to get it's exact version:

```
# Inspect an image
$ docker inspect --format '{{(index .Config.Labels "version")}}' xivoxc/
$ xuc:2017.03.latest
2017.03.02
# Inspect a running container
$ docker inspect --format '{{(index .Config.Labels "version")}}' xivocc_xuc_1
2017.03.02
```

Log

The log of each container can be found in the */var/log/xivocc* directory. Currently (it may change) the structure looks like this :

```
/var/log/xivocc:
  - config-mgt
    L____ config-mgt.log

    purge-reporting-database.log

  - recording-server

    downloads.log

    recording-server.log

  - spagobi
      — Quartz.log

    SpagoBIBirtReportEngine.log

     — SpagoBIChartEngine.log

    SpagoBIJasperReports.log

     — SpagoBI.log

    — SpagoBIQbeEngineAudit.log

      - SpagoBIQbeEngine.log
    SpagoBITalendEngine.log
  - specific-stats.log
   xivo-db-replication
    └── xivo-db-replication.log
   xivo-full-stats
    ____ xivo-full-stats.log
```

Backup

You may backup your databases by using a similar command as below, make sure you have enough space on disk.

Restore

You may restore a backup using a similar command (to be adapted)

```
#Restore
```

```
cd /var/backups/xivocc
```

4.3 Troubleshooting

Important:

- When reading this section, keep in mind the Architecture & Flows diagram.
- If you want to troubleshoot your installation see XiVOcc Installation Troubleshooting
- For desktop application see Troubleshoot Application

4.3.1 Troubleshooting

Transfers using DTMF

When transfering a call using DTMF (*1) you get an invalid extension error when dialing the extension.

The workaround to this problem is to create a preprocess subroutine and assign it to the destinations where you have the problem.

Under Services \rightarrow IPBX \rightarrow IPBX configuration \rightarrow Configuration files add a new file containing the following dialplan:

```
[allow-transfer]
exten = s,1,NoOp(## Setting transfer context ##)
same = n,Set(__TRANSFER_CONTEXT=<internal-context>)
same = n,Return()
```

Do not forget to substitute <internal-context> with your internal context.

Some places where you might want to add this preprocess subroutine is on queues and outgoing calls to be able to transfer the called person to another extension.

Fax detection

XiVO **does not currently support Fax detection**. The following describe a workaround to use this feature. The behavior is to answer all incoming (external) call, wait for a number of seconds (4 in this example) : if a fax is detected, receive it otherwise route the call normally.

Note: This workaround works only :

- on incoming calls towards an User (and an User only),
- if the incoming trunk is a DAHDI or a SIP trunk,
- · if the user has a voicemail which is activated and with the email field filled
- XiVO >= 13.08 (needs asterisk 11)

Be aware that this workaround will probably not survive any upgrade.

1. In the Web Interface and under *Services* → *IPBX* → *IPBX configuration* → *Configuration files* add a new file named *fax-detection.conf* containing the following dialplan:

```
;; Fax Detection
[pre-user-global-faxdetection]
exten = s,1,NoOp(Answer call to be able to detect fax if call is external AND_
→user has an email configured)
same = n,GotoIf($["${XIVO_CALLORIGIN}" = "extern"]?:return)
same = n,GotoIf(${XIVO_USEREMAIL}?:return)
same = n,Set(FAXOPT(faxdetect)=yes) ; Activate dynamically fax detection
same = n,Answer()
same =
        n,Wait(4) ; You can change the number of seconds it will wait for_
\rightarrow fax (4 to 6 is good)
same = n,Set(FAXOPT(faxdetect)=no) ; If no fax was detected deactivate_
-dyamically fax detection (needed if you want directmedia to work)
same = n(return), Return()
exten = fax,1,NoOp(Fax detected from ${CALLERID(num)} towards ${XIVO_DSTNUM} -_
→will be sent upon reception to ${XIVO_USEREMAIL})
           n,GotoIf($["${CHANNEL(channeltype)}" = "DAHDI"]?
same =
⇔changeechocan:continue)
```

2. In the file /etc/xivo/asterisk/xivo_globals.conf set the global user subroutine to pre-user-global-faxdetection: this subroutine will be executed each time a user is called:

XIVO_PRESUBR_GLOBAL_USER = pre-user-global-faxdetection

3. Reload asterisk configuration (both for dialplan and dahdi):

```
asterisk -rx 'core reload'
```

Berofos Integration with PBX

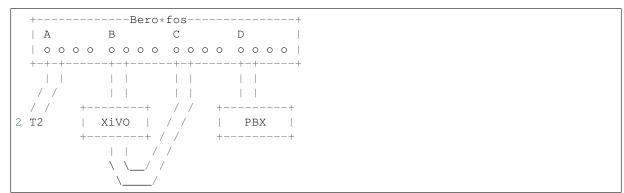

You can use a Berofos failover switch to secure the ISDN provider lines when installing a XiVO in front of an existing PBX. The goal of this configuration is to mitigate the consequences of an outage of the XiVO : with this equipment the ISDN provider links could be switched to the PBX directly if the XiVO goes down.

XiVO **does not offer natively** the possibility to configure Berofos in this failover mode. This section describes a workaround.

Logical view:

```
-- Provider ---- | XiVO | -- ISDN Interconnection -- | PBX | -- Phones
```

Connection:

The following describes how to configure your XiVO and your Berofos.

- 1. Follow the Berofos general configuration (firmware, IP, login/password) described in the the *Berofos Installation and Configuration* page.
- 2. When done, apply these specific parameters to the berofos:

```
bnfos --set scenario=1-h 10.105.2.26 -u admin:berofosbnfos --set mode=1-h 10.105.2.26 -u admin:berofosbnfos --set modedef=1-h 10.105.2.26 -u admin:berofosbnfos --set wdog=1-h 10.105.2.26 -u admin:berofosbnfos --set wdogdef=1-h 10.105.2.26 -u admin:berofosbnfos --set wdogdef=1-h 10.105.2.26 -u admin:berofosbnfos --set wdogtime=60-h 10.105.2.26 -u admin:berofos
```

3. Add the following script /usr/local/sbin/berofos-workaround:

```
#!/bin/bash
# Script workaround for berofos integration with a XiVO in front of PABX
```

```
res=$(/usr/sbin/service asterisk status)
does_ast_run=$?
if [ $does_ast_run -eq 0 ]; then
    /usr/bin/logger "$0 - Asterisk is running"
    # If asterisk is running, we (re)enable wdog and (re)set the mode
   /usr/bin/bnfos --set mode=1 -f fos1 -s
   /usr/bin/bnfos --set modedef=1 -f fos1 -s
    /usr/bin/bnfos --set wdog=1 -f fos1 -s
    # Now 'kick' berofos ten times each 5 seconds
    for ((i == 1; i <= 10; i += 1)); do
        /usr/bin/bnfos --kick -f fos1 -s
        /bin/sleep 5
    done
else
    /usr/bin/logger "$0 - Asterisk is not running"
fi
```

4. Add execution rights to script:

chmod +x /usr/local/sbin/berofos-workaround

5. Create a cron to launch the script every minutes /etc/cron.d/berofos-cron-workaround:

```
# Workaround to berofos integration
MAILTO=""
*/1 * * * * root /usr/local/sbin/berofos-workaround
```

Upgrading from XiVO 1.2.3

1. There is an issue with xivo-libsccp and pf-xivo-base-config during an upgrade from 1.2.3:

```
dpkg: error processing /var/cache/apt/archives/pf-xivo-base-config_13%3a1.2.4-

$\infty1_all.deb (--unpack):

trying to overwrite '/etc/asterisk/sccp.conf', which is also in package xivo-

$\infty1bsccp 1.2.3.1-1

...

Errors were encountered while processing:

/var/cache/apt/archives/pf-xivo-base-config_13%3a1.2.4-1_all.deb

E: Sub-process /usr/bin/dpkg returned an error code (1)
```

2. You have to remove /var/lib/dpkg/info/xivo-libsccp.conffiles:

rm /var/lib/dpkg/info/xivo-libsccp.conffiles

3. You have to edit /var/lib/dpkg/info/xivo-libsccp.list and remove the following line:

/etc/asterisk/sccp.conf

4. and remove /etc/asterisk/sccp.conf:

rm /etc/asterisk/sccp.conf

5. Now, you can launch xivo-upgrade to finish the upgrade process

CTI server is unexpectedly terminating

If you observes that your CTI server is sometimes unexpectedly terminating with the following message in /var/log/xivo-ctid.log:

```
(WARNING) (main): AMI: CLOSING
```

Then you might be in the case where asterisk generates lots of data in a short period of time on the AMI while the CTI server is busy processing other thing and is not actively reading from its AMI connection. If the CTI server takes too much time before consuming some data from the AMI connection, asterisk will close the AMI connection. The CTI server will terminate itself once it detects the connection to the AMI has been lost.

There's a workaround to this problem called the ami-proxy, which is a process which buffers the AMI connection between the CTI server and asterisk. This should only be used as a last resort solution, since this increases the latency between the processes and does not fix the root issue.

To enable the ami-proxy, you must:

1. Add a file /etc/systemd/system/xivo-ctid.service.d/ami-proxy.conf:

```
mkdir -p /etc/systemd/system/xivo-ctid.service.d
cat >/etc/systemd/system/xivo-ctid.service.d/ami-proxy.conf <<EOF
[Service]
Environment=XIVO_CTID_AMI_PROXY=1
EOF
systemctl daemon-reload</pre>
```

2. Restart the CTI server:

systemctl restart xivo-ctid.service

If you are on a XiVO cluster, you must do the same procedure on the slave if you want the ami-proxy to also be enabled on the slave.

To disable the ami-proxy:

```
rm /etc/systemd/system/xivo-ctid.service.d/ami-proxy.conf
systemctl daemon-reload
systemctl restart xivo-ctid.service
```

Agents receiving two ACD calls

Warning: Procedure was removed since bug was fixed in asterisk version shipped in 2017.LTS1 (2017.03)

PostgreSQL localization errors

The database and the underlying database cluster used by XiVO is sensitive to the system locale configuration. The locale used by the database and the database cluster is set when XiVO is installed. If you change your system locale without particular attention to PostgreSQL, you might make the database and database cluster temporarily unusable.

When working with locale and PostgreSQL, there's a few useful commands and things to know:

- locale -a to see the list of currently available locales on your system
- locale to display information about the current locale of your shell
- grep ^lc_ /etc/postgresql/9.4/main/postgresql.conf to see the locale configuration of your database cluster
- sudo -u postgres psql -l to see the locale of your databases
- the /etc/locale.gen file and the associated locale-gen command to configure the available system locales
- systemctl restart postgresql.service to restart your database cluster

• the PostgreSQL log file located at /var/log/postgresql/postgresql-9.4-main.log

Note: You can use any locale with XiVO as long as it uses an UTF-8 encoding.

Database cluster is not starting

If the database cluster doesn't start and you have the following errors in your log file:

```
LOG: invalid value for parameter "lc_messages": "en_US.UTF-8"
LOG: invalid value for parameter "lc_monetary": "en_US.UTF-8"
LOG: invalid value for parameter "lc_numeric": "en_US.UTF-8"
LOG: invalid value for parameter "lc_time": "en_US.UTF-8"
FATAL: configuration file "/etc/postgresql/9.4/main/postgresql.conf" contains_
→errors
```

Then this usually means that the locale that is configured in postgresql.conf (here en_US.UTF-8) is not currently available on your system, i.e. does not show up the output of locale -a. You have two choices to fix this issue:

- either make the locale available by uncommenting it in the /etc/locale.gen file and running locale-gen
- or modify the /etc/postgresql/9.4/main/postgresql.conf file to set the various lc_* options to a locale that is available on your system

Once this is done, restart your database cluster.

Can't connect to the database

If the database cluster is up but you get the following error when trying to connect to the asterisk database:

Then this usually means that the database locale is not currently available on your system. You have two choices to fix this issue:

- either make the locale available by uncommenting it in the /etc/locale.gen file, running locale-gen and restarting your database cluster
- or recreate the database using a different locale

Error during the upgrade

Then you are mostly in one of the cases described above. Check your log file.

Error while restoring a database backup

If during a database restore, you get the following error:

```
pg_restore: [archiver (db)] Error while PROCESSING TOC:
pg_restore: [archiver (db)] Error from TOC entry 4203; 1262 24745 DATABASE_
→asterisk asterisk
```

Then this usually means that your database backup has a locale that is not currently available on your system. You have two choices to fix this issue:

- either make the locale available by uncommenting it in the /etc/locale.gen file, running locale-gen and restarting your database cluster
- or if you want to restore your backup using a different locale (for example fr_FR.UTF-8), then restore your backup using the following commands instead:

```
sudo -u postgres dropdb asterisk
sudo -u postgres createdb -l fr_FR.UTF-8 -O asterisk -T template0 asterisk
sudo -u postgres pg_restore -d asterisk asterisk-*.dump
```

Error during master-slave replication

Then the slave database is most likely not using an UTF-8 encoding. You'll need to recreate the database using a different locale

Changing the locale (LC_COLLATE and LC_CTYPE) of the database

If you have decided to change the locale of your database, you must:

- make sure that you have enough space on your hard drive, more precisely in the file system holding the /var/lib/postgresql directory. You'll have, for a moment, two copies of the asterisk database.
- prepare for a service interruption. The procedure requires the services to be restarted twice, and the system performance will be degraded while the database with the new locale is being created, which can take a few hours if you have a really large database.
- make sure the new locale is available on your system, i.e. shows up in the output of locale -a

Then use the following commands (replacing fr_FR.UTF-8 by your locale):

You should also modify the /etc/postgresql/9.4/main/postgresql.conf file to set the various lc_* options to the new locale value.

For more information, consult the official documentation on PostgreSQL localization support.

Originate a call from the Asterisk console

It is sometimes useful to ring a phone from the asterisk console. For example, if you want to call the 1234 extension in context default:

channel originate Local/1234@default extension 42@xivo-callme

WebRTC

• *http.conf* - asterisk's webserver must accept connection from outside, the listen address must be updated, for the sake of simplicity let's use 0.0.0.0, you can also pick an address of one of the network interfaces:

```
[general]
enabled=yes
bindaddr=0.0.0.0
bindport=5039
prefix=
tlsenable=yes
tlsbindaddr=127.0.0.1:5040
tlscertfile=/usr/share/xivo-certs/server.crt
tlsprivatekey=/usr/share/xivo-certs/server.key
servername=XiVO PBX
```

Do not forget to reload the configuration by the module reload http command on the Asterisk CLI.

• *rtp.conf* - the ICE support must be activated:

```
:
; RTP Configuration
;
[general]
;
; RTP start and RTP end configure start and end addresses
;
; Defaults are rtpstart=5000 and rtpend=31000
;
rtpstart=10000
rtpend=20000
;
; Whether to enable or disable UDP checksums on RTP traffic
;
;rtpchecksums=no
;
; The amount of time a DTMF digit with no 'end' marker should be
; allowed to continue (in 'samples', 1/8000 of a second)
;dtmftimeout=3000
icesupport=yes
stunaddr=stun.l.google.com:19302
```

The configuration is reloaded by module reload res_rtp_asterisk.so.

• WebRTC requires DTLS keys to be generated in */etc/asterisk/keys*. If you need to manually generate the DTLS certificates following instructions on the Asterisk Wiki: https://wiki.asterisk.org/wiki/display/AST/Secure+Calling+Tutorial. You just need to generate the TLS certificates (first call of *ast_tls_cert*), other steps are not necessary. Make sure asterisk can read files by executing: chown -R asterisk. asterisk /etc/asterisk/keys

4.3.2 Xuc & Xucmgt (CC & UC applications)

Basic checks

XUC overview page

XUC overview page available at @XUC_IP:PORT, usually @SERVER_IP:8090. You have to check if the "Internal configuration cache database" contains agents, queues etc.

XUC sample page

XUC sample page available at @XUC_IP:PORT/sample, usually @SERVER_IP:8090/sample. You can use this page to check user login and other API functions. CCManager, agent and assistant web use functions available on the sample page.

UC Assistant

Favorites

With *XiVO PBX* < 15.18 (without xivo-dird) one has to configure xuc with the runtime parameter xivo. useDird=false: with this parameter set, one can't add Favorites (though the star to add a Favorite is visible).

4.3.3 NGINX - proxy web

Basic check

On the standard HTTP port of the machine (80) you have the fingerboard page.

Docker says nginx is restarting

• Check logs for missing files or links, nginx refuses to start if one of servers is not accessible, e.g. xuc is down.

4.3.4 PostgreSQL

Container keeps on restarting after upgrade

After upgrading Docker it can sometimes happen that the container *xivocc_pgxivocc_1* gets stuck in restarting mode. Logs show the following error

```
FATAL: data directory "/var/lib/postgresql/data" has group or world access DETAIL: Permissions should be u=rwx (0700).
```

Error is caused by wrong permissions on the PostgreSQL data directory. Follow the below steps in order to fix the issue:

1. Find the location of the directory inside the container information:

docker inspect xivocc_pgxivocc_1 | grep volumes

2. Command output should give something like this:

```
"Source": "/var/lib/docker/volumes/

$\log82898d65ae41174865211ff709c12b1f5e7b3c1b7d26e73500b6e6c7cffb3f10/_data",
```

3. Use the result above to change the permissions:

```
chmod -R 700 /var/lib/docker/volumes/
→82898d65ae41174865211ff709c12b1f5e7b3c1b7d26e73500b6e6c7cffb3f10/_data
```

4. Restart the container:

```
xivocc-dcomp restart pgxivocc
```

4.3.5 Reporting

xivo_replic does not replicate call data

After experiencing a 'no space left on device' and restarting containers, it can sometimes happen that the data from XiVO is not replicated anymore. Container *xivocc_replic_1* logs show the following error:

Error is caused by a lock in liquibase db. Follow the below steps in order to fix the issue:

Warning: This problem should not happen, so you should know what you are doing and not follow this procedure blindly.

1. With xivo_stats, xivo_replic and pack_reporting containers stopped find if there still is an active lock:

2. If so, delete the lock:

3. Restart the containers:

```
xivocc-dcomp start xivo_replic
xivocc-dcomp start pack_reporting
xivocc-dcomp start xivo_stats
```

```
Now, if xivo_stats is stuck in exit (126), try a docker rm -v {xivo_stats contener id} followed by a xivocc-dcomp up -d.
```

CHAPTER 5

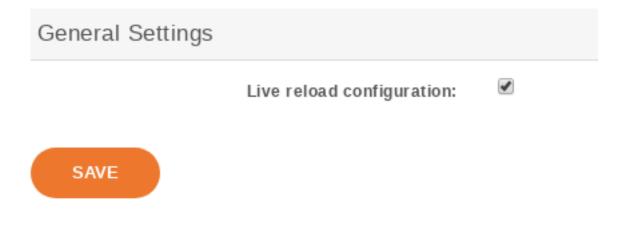

IPBX Configuration Guide

5.1 Advanced Configuration

This section describes the advanced system configuration.

5.1.1 XiVO General Settings

XiVO offers the possibility to configure the general settings via the *Configuration* \rightarrow *Management* \rightarrow *General* page.

Live reload configuration permit to reload its configuration on command received from WEBI (this option is enabled by default).

If you deactivate Live reload, apart from commands to xivo-ctid service, no config update command will be sent to udpate the services configuration. You must then reload the configuration accordingly.

5.1.2 Activate Directmedia with SIP Provider & DTMF RFC 2833

Important: This page describes how to enable Directmedia on your XiVO PBX in **the specific following context**:

- with a SIP Provider authorizing directmedia (or requiring it),
- and with this SIP Provider using DTMF according to RFC 2833

Other use cases are not covered here.

Introduction

Directmedia is an Asterisk feature to optimize network streams. By default, when asterisk establishes a call between two phones, it establishes the media stream (voice or video RTP stream) via itself. Then, if A calls B, the media stream goes from A to asterisk and then from asterisk to B:

```
Without directmedia:

A <---- SIP & RTP ----> | XiVO | <---- SIP & RTP ----> B

+------+
```

Enabling Directmedia make media streams to flow directly between A and B:

```
With directmedia activated:

A <------ SIP ------> | XiVO | <----- SIP -----> B

^ ^ ^ ^ _ RTP ____^
```

This is particularly useful when your XiVO PBX and phones are not located on the same site. In this case, activating Directmedia could dramatically save network bandwidth.

Prerequisites

- As written in the note above we only cover the case where your SIP Provider will accept media stream directly between your endpoints and its media gateways.
- Also it describes how to configure your system if your SIP Provider accepts DTMF in RFC 2833.
- And you **must** ensure that network routing is working between your different endpoints as enabling directmedia means that media stream will flow directly between endpoints (phones, gateways, operators etc.).
- Note also that in this context network QoS should be taken into account with great care, but is outside the scope of this page.

Configuration

Directmedia activation

First of all, enable directmedia on your XiVO PBX:

- 1. Go to Services -> IPBX -> General settings -> SIP Protocol -> Default
- 2. Set Redirect media stream to Not behind NAT
- 3. Set DTMF to RFC2833

Device configuration

Device configuration must be changed to activate the RFC 2833 DTMF mode:

- 1. Go to Configuration -> Provisioning -> Template device
- 2. Edit the Default template device
- 3. and set *DTMF* to **RTP-out-of-band**
- 4. This requires a synchronization of all Devices (see Synchronize a device)

SIP Provider Trunk Configuration

Verify that your SIP Provider trunk configuration has also directmedia activated:

- 1. Edit your SIP Provider trunk,
- 2. In tab Advanced set Redirect media streams to Not behind NAT
- 3. In tab Signalling set DTMF to RFC2833

Other SIP Trunks

If you have other SIP trunks on your installation, you should verify that the DTMF mode is according to what the endpoint support. And, as it is not covered in this guide, we recommend that you deactivate directmedia:

- 1. Edit the SIP trunk,
- 2. In tab Advanced set Redirect media streams to No
- 3. In tab *Signalling* set *DTMF* to the one supported by the endpoint.

User configuration

For directmedia to work with DTMF set in RFC 2833 mode you must deactivate the following options for users:

- 1. Go to Services -> IPBX -> IPBX Settings -> Users,
- 2. edit each user except Switchboard user,
- 3. go to tab Services
- 4. and un-check all following options:
- Enable call transfer
- Enable online call recording

Groups configuration

For directmedia to work with DTMF set in RFC 2833 mode you must deactivate the following options for groups:

- 1. Go to Services -> IPBX -> IPBX Settings -> Groups,
- 2. edit each group,
- 3. go to tab Application
- 4. and un-check all following options:
- Allow called one to transfer the caller
- Allow caller to transfer the call

- Allow called on to record the call
- Allow caller to record the call

Queues configuration

For directmedia to work with DTMF set in RFC 2833 mode you **must** deactivate the following options for queues:

- 1. Go to Services -> Call Center -> Configuration -> Queues,
- 2. edit each queue except the Switchboard queue,
- 3. go to menu Application
- 4. and un-check all following options:
- Allow callee to hang up the call
- Allow caller to hang up the call
- Allow callee to transfer the call
- Allow caller to transfer the call
- Allow callee to record the call
- Allow caller to record the call

Conclusion

After having followed the above configuration steps, your XiVO will be configured for directmedia with a SIP Provider using DTMF in RFC 2833 mode.

Limitations

This configuration is not compatible with:

- XiVO Client transfer method:
 - after having un-checked the option *Enable call transfer* transfer won't be possible from legacy XiVO Client.
- Switchboard: calls towards Switchboard will be without directmedia. Directmedia will be activated on the call after having been transfered (as the legacy transfer method must be used for Switchboard CTI application)
- Jitterbuffer: jitterbuffer must be disabled on your XiVO PBX.
- Recording: if the call recording is activated for calls, it will disable Directmedia on these calls.
- ChanSpy: listening to an agent (see CCManager application documentation) will disable temporarily the directmedia. When listening is stopped, media flow will be re-established directly between agent and caller.

5.1.3 Telephony certificates

XiVO offers the possibility to create and manage X.509 certificates via the the Configuration \rightarrow Management \rightarrow Certificates page.

These certificates can be used for:

- enabling SIP TLS
- enabling encryption between the CTI server and the XiVO clients

For the certificate used for HTTPS, see HTTPS certificate.

Creating certificates

You can add a certificate by clicking on the add button at the top right of the page. You'll then be shown this page:

| Certificates > Add | |
|--------------------------|-------------|
| General | |
| Name: | |
| Certification authority: | |
| A utos igne d: | |
| Certification authority: | aastra-CA 🔻 |
| CA password: | |
| Pas sword: | |
| Cipher: | v |
| Key length: | 1024 🔻 |
| Validity end date: | |
| | |
| Common name: | Θ |
| Email : | |
| Unit: | |
| Organization: | |
| City: | |
| State: | |
| Country: | |
| SAVE | |

You should look at the *examples* if you don't know which attributes to set when creating your certificates.

Removing certificates

When removing a certificate, you should remove all the files related to that certificates.

Warning: If you remove a certificate that is used somewhere in XiVO, then you need to manually reconfigure that portion of XiVO.

For example, if you remove the certificate files used for SIP TLS, then you need to manually disable SIP TLS or asterisk will look for certificate file but it won't be able to find them.

Examples

In the following examples, if a field is not specified than you should leave it at its default value.

Creating certificates for SIP TLS

You need to create both a CA certificate and a server certificate.

CA certificate:

- Name : phones-CA
- Certification authority (checkbox) : checked
- Autosigned : checked
- *Valid end date* : at least one month in the future
- Common name : the FQDN (Fully Qualified Domain Name) of your XiVO
- Organization : your organization's name, or blank
- *Email* : your email or organization's email

Server certificate:

- Name : phones
- Certification authority (select) : phones-CA
- Valid end date : at least one month in the future
- Common name : the FQDN of your XiVO
- Organization : your organization's name, or blank
- Email : your email or organization's email

Creating certificate for CTI server

- Name : xivo-ctid
- Autosigned : checked
- Valid end date : at least one month in the future
- Common name : the FQDN of your XiVO
- Organization : your organization's name, or blank
- Email : your email or organization's email

Warning: You must *not* set a password for the certificate. If the certificate is password protected, the CTI server will not be able to use it.

5.2 Boss Secretary Filter

The boss secretary filter allow to set a secretary or a boss role to a user. Filters can then be created to filter calls directed to a boss using different strategies.

5.2.1 Quick Summary

In order to be able to use the boss secretary filter you have to :

- Select a boss role for one the users
- Select a secretary role for one ot the users
- Create a filter to set a strategy for this boss secretary filter
- Add a function key for the user boss and the user secretary

5.2.2 Defining a Role

The secretary or boss role can be set in the user's configuration page under the service tab. To use this feature, at least one boss and one secretary must be defined.

| Users > Edit Linda - Provisioning: <333356> | | | | |
|---|--------------|-----------|--------|-----------|
| General Lines No answ | ver Services | Voicemail | Groups | Func Keys |
| Services | | | | |
| Enable supervision: | s d | | | |
| Enable call transfer: | | | | |
| Enable online call recording: | | | | |
| Call recording: | | | | |
| Incoming call filtering: | | | | |
| Do not disturb: | | | | |
| Filter Boss - Secretary: | Boss V | | | |
| Agent: | | | • | |

5.2.3 Creating a Filter

The filter is used to associate a boss to one or many secretaries and to set a ring strategy. The call filter is added in the Services \rightarrow *IPBX* \rightarrow *Call management* \rightarrow *Call filters* page.

Different ringing strategies can be applied :

- · Boss rings first then all secretaries one by one
- · Boss rings first then secretaries are all ringing simultaneously
- Secretaries ring one by one
- Secretaries are all ringing simultaneously
- · Boss and secretaries are ringing simultaneously
- Change the caller id if the secretary wants to know which boss was initialy called

When one of serial strategies is used, the first secretary called is the last in the list. The order can be modified by drag and drop in the list.

5.2.4 Usage

The call filter function can be activated and deactivated by the boss or the secretary using the *37 extension. The extension is defined in *IPBX services > Extensions*.

| Entity: | showroom * |
|----------------------------|--|
| Name: | fernando |
| Call from: | All |
| Mode: | Secretaries simultaneously |
| Ringing time: | Boss first then secretaries in serial Boss first then secretaries simultaneously Secretaries in serial |
| CallerID mode : | Secretaries simultaneously Boss and secretaries simultaneously |
| Identity: Ringing time: | Fernando L'Igüane Vnlimited |
| stary | |
| | 2 items selected Remove all |

The call filter has to be activated for each secretary if more than one is defined for a given boss.

🗘 Linda (*3710)

The extension to use is *37<callfilter member id>.

In this example, you would set 2 $\texttt{Func}\,$ Keys $\star373$ and $\star374$ on the Boss.

On the secretary Jina LaPlante you would set *373.

On the secretary Ptit Nouveau you would set *374.

| Secretary | | | |
|-----------|------------------|------------|--|
| | 2 items selected | Remove all | |
| | ‡ Linda (*3710) | - | |
| | Rebacca (*3711) | - | |
| | | | |
| | | | |
| | | | |
| | | | |

5.2.5 Function Keys

A more convenient way to active the boss secretary filter is to assign a function key on the boss' phone or the secretary's phone. In the user's configuration under Func Keys. A function key can be added for each secretaries of a boss.

If supervision is activated, the key will light up when filter is activated for this secretary. If a secretary also has a function key on the same boss/secretary combination the function key's BLF will be in sync between each phones.

Warning: With SCCP phones, you must configure a custom Func Keys.

5.3 Call Completion

The call completion feature (or CCSS, for Call Completion Supplementary Services) in XiVO allows for a caller to be automatically called back when a called party has become available.

- 1. To illustrate, let's say Alice attempts to call Bob.
- 2. Bob is currently on a phone call with Carol, though, so Bob rejects the call from Alice
- 3. Alice then dials *40 to request call completion.
- 4. Once Bob has finished his phone call, Alice will be automatically called back by the system.
- 5. When she answers, Bob will be called on her behalf.

This feature has been introduced in XiVO in version 14.17.

5.3.1 Description

Call completion can be used in two scenarios:

- when the called party is busy (Call Completion on Busy Subscriber)
- when the called party doesn't answer (Call Completion on No Response)

We have already discussed the busy scenario in the introduction section.

Let's now illustrate the no answer scenario:

- 1. Alice attempts to call Bob.
- 2. Bob doesn't answer the phone. Alternatively, Alice hangs up before Bob has the time to answer the call.
- 3. Alice then dial *40 to request call completion.
- 4. When Bob's phone becomes busy and then is no longer busy, Alice is automatically called back.
- 5. When she answers, Bob will be called on her behalf.

The important thing to note here is step #4. Bob's phone needs to become busy and then no longer busy for Alice to be called back. This means that if Bob was away when Alice called him, but when he came back he did not received nor placed any call, then Alice will not be called back.

In fact, in all scenarios, after call completion has been requested by the caller, the called phone needs to transition from busy to no longer busy for the caller to be called back. This means that in the following scenario:

- 1. Alice attempts to call Bob.
- 2. Bob is currently on a phone call, so he doesn't answer the call from Alice.
- 3. Bob finish his call a few seconds later.
- 4. Alice then dials *40 to request call completion (Bob is not busy anymore).

Then, for Alice to be called back, Bob needs to become busy and then not busy.

If Alice is busy when Bob becomes not busy, then the call completion callback will only happen after both Alice and Bob are not busy.

When call completion is active, it can be cancelled by dialing the *40 extension.

Some timers governs the use of call completion. These are:

- offer timer: the time the caller has to request call completion. Defaults to 30 (seconds).
- busy available timer: when call completion on busy subscriber is requested, if this timer expires before the called party becomes available, then the call completion attempt will be cancelled. Defaults to 900 (seconds).
- no response available timer: similar to the "busy available timer", but when call completion on no response is requested. Defaults to 900 (seconds).
- recall timer: when the caller who requested call completion is called back, how long the original caller's phone rings before giving up. Defaults to 30 (seconds).

It's currently impossible to modify the value of these timers in XiVO.

Special Scenarios

There are four special scenarios:

- the call completion will not activate
- the call completion will activate and call back for the original called party
- the call completion will activate and call back for the rerouted called party
- the call completion will activate and call back for the original called party but fail to join him

Call completion will not activate

It is not possible to activate call completion in the following two scenarios.

First scenario: Alice tries to call Bob, but Bob has currently reached its "simultaneous calls" limit. When activating call completion, Alice hears that the call completion can not be activated.

Note: The "simultaneous calls" option is configured per user via the XiVO web interface.

Second scenario: Alice tries to call Bob, but the call is redirected to Charlie.

This occurs when Bob redirects/rejects the call with any of the following:

- Unconditional call forwarding towards Charlie
- Closed schedule towards Charlie
- · Call permission forbidding Alice to call Bob
- Preprocess subroutine forwarding the call towards Charlie

Call completion will activate and call back for the original called party

Scenario: Alice tries to call Bob, but the call is redirected to Charlie. When activating call completion, Alice hears that the call completion is activated and eventually Alice is called back to speak with Bob.

This occurs when Bob redirects/rejects the call with any of the following:

• No-answer call forwarding towards Charlie

• Busy call forwarding towards Charlie

Call completion will activate and call back for the rerouted called party

Scenario: Alice tries to call Bob, but the call is redirected to Charlie. When activating call completion, Alice hears that the call completion is activated and eventually Alice is called back to speak with Charlie.

This occurs when Bob redirects the call with any of the following:

• Boss-Secretary filter to the secretary Charlie

Call completion will activate and call back for the original called party but fail to join him

Scenario: Alice tries to call Bob, but the call is redirected to Charlie. When activating call completion, Alice hears that the call completion is activated and eventually Alice is called back to speak with Bob. But when Alice answers, Bob is not called. If Alice activates call completion again, she will hear that the call completion was cancelled.

This occurs when Bob redirects/rejects the call with any of the following:

- Do Not Disturb mode
- a new call forwarding rule that was applied after Alice activated call completion:
 - Unconditional call forwarding towards Charlie
 - Closed schedule towards Charlie
 - Call permission forbidding Alice to call Bob
 - Preprocess subroutine forwarding the call towards Charlie

Limitations

- Call completion can only be used with SIP lines. It can't be used with SCCP lines.
- It can't be used with outgoing calls and incoming calls, except if these calls are passing through a customized trunk of type Local.
- It can't be used with groups or queues.
- The call completion feature can't be enabled only for a few users; either all users have access to it, or none.

5.3.2 Configuration

The call completion extension is enabled via the Services \rightarrow IPBX \rightarrow IPBX services \rightarrow Extensions page, in the General tab.

| Enable/disable call completion: | 4 |
|---------------------------------|-----|
| Extension : | *40 |

Fig. 5.3: Call Completion Extension

If your XiVO has been installed in version 14.16 or earlier, then this extension is by default disabled. Otherwise, this extension is by default enabled.

5.4 Call Permissions

You can manage call permissions via the Services \rightarrow IPBX \rightarrow Call management \rightarrow Call permissions page. Call permissions can be used for:

- denying a user from calling a specific extension
- denying a user of a group from calling a specific extension
- denying a specific extension on a specific outgoing call from being called
- denying an incoming call coming from a specific extension from calling you

More than one extension can match a given call permission, either by specifying more than one extension for that permission or by using extension patterns.

You can also create permissions that allow a specific extension to be called instead of being denied. This make it possible to create a general "deny all" permission and then an "allow for some" one.

Finally, instead of unconditionally denying calling a specific extension, call permissions can instead challenge the user for a password to be able to call that extension.

As you can see, you can do a lot of things with XiVO's call permissions. They can be used to create fairly complex rules. That said, it is probably *not* a good idea to so because it's pretty sure you'll get it somehow wrong.

5.4.1 Examples

Note that when creating or editing a call permission, you must at least:

- fill the Name field
- have one extension / extension pattern in the Extensions field

Denying a user from calling a specific extension

- Add the extension in the extensions list
- In the *Users* tab, select the user

Note: User's *Rightcall Code* (*Services -> IPBX -> IPBX Settings -> Users* under *Services* tab) overwrite all password call permissions for the user.

Warning: The extension can be anything but it will only work if it's the extension of a user or an extension that pass through an outgoing call. It does *not* work, for example, if the extension is the number of a conference room.

Denying a user of a group from calling a specific extension

First, you must create a group and add the user to this group. Note that groups aren't required to have a number. Then,

- Add the extension in the extensions list
- In the Groups tab, select the group

Denying users from calling a specific extension on a specific outgoing call

- Add the extension in the extensions list
- In the Outgoing calls tab, select the outgoing call

Note that selecting both a user and an outgoing call for the same call permission doesn't mean the call permission applies only to that user. In fact, it means that the user can't call that extension and that the extension can't be called on the specific outgoing call. This in redundant and you will get the same result by not selecting the user.

Denying an incoming call coming from a specific extension from calling you

Call permissions on incoming calls are semantically different from the other scenarios since the extension that you add to the permission will match the extension of the caller (i.e. the caller number) and *not* the extension that the caller dialed (i.e. the callee number).

- Add the extension in the extensions list.
- In the Incoming calls tab, select the incoming call

5.5 Call Logs

Call logs are pre-generated from CEL entries. The generation is done automatically by xivo-call-logd. xivo-call-logs is also run nightly to generate call logs from CEL that were missed by xivo-call-logd.

Note: The oldest call logs are periodically removed. See Purge Logs for more details.

5.5.1 Search Dashboard

Call logs can be accessed using the menu Services \rightarrow IPBX \rightarrow Call management \rightarrow Call Logs page.

Call Logs

Start date:

2018-03-29

End date:

SEARCH

Fig. 5.4: Calls Records Dashboard

Specifying no start date returns all available call logs. Specifying a start date and no end date returns all call logs from start date until now.

Call logs are presented in a CSV format. Here's an example:

```
Call Date, Caller, Called, Period, user Field
2015-01-02T00:00:00, Alice (1001), 1002, 2, userfield
```

The CSV format has the following specifications:

- field names are listed on the first line
- fields are separated by commas: ,
- if there is a comma in a field value, the value is surrounded by double quotes: "
- the UTF-8 character encoding is used

5.5.2 REST API

Call logs are also available from xivo-confd REST API.

5.5.3 Manual generation

Call logs can also be generated manually. To do so, log on to the target XiVO server and run:

```
xivo-call-logs
```

To avoid running for too long in one time, the call logs generation is limited to the N last unprocessed CEL entries (default 20,000). This means that successive calls to xivo-call-logs will process N more CELs, making about N/10 more calls available in call logs, going further back in history, while processing new calls as well.

You can specify the number of CEL entries to consider. For example, to generate calls using the 100,000 last unprocessed CEL entries:

xivo-call-logs -c 100000

5.6 Conference Room

5.6.1 Adding a conference room

In this example, we'll add a conference room with number 4010.

First, you need to define a conference room number range for the ''default'' context via the Services -> IPBX -> IPBX Configuration -> Contexts page.

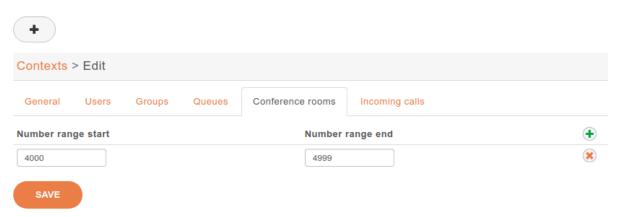

Fig. 5.5: Adding a conference room number range to the default context

You can then create a conference room via the Services -> IPBX -> IPBX Settings -> Conference rooms page.

In this example, we have only filled the "Name" and "Number" fields, the others have been left to their default value.

| Conference rooms > Add | | |
|------------------------|-----------|---|
| General | Advance | d |
| | Name: | room-4010 |
| | Number: | 4010 |
| | Context: | Default (default) |
| On-Hol | d Music: | default v |
| Р | IN code: | |
| - Organi | zer | |
| Organizer | PIN code: | |
| Waiti | ng Room: | |
| | Descrip | tion : |
| | | |
| SAVE | | |
| | | Fig. 5.6: Creating conference room 4010 |

As you can see, there's quite a few options when adding / editing a conference room. Here's a description of the most common one:

General Tab

- *Pin code*: Protects your conference room with a PIN number. People trying to join the room will be asked for the PIN code.
- Organizer Pin Code: This pin code is used to define an organizer for the conference, organizer will have the right to mute or kick participants with the *Conferences* monitoring in uc assistant application.
- *Waiting room*: Once this option is checked the users are not able to speak in the room and have to wait the organizer to join the conference.

Note: You must define a general pin code if you want to be able to organize conferences and use the organizers features.

Advanced Tab

SAVE

| Conference rooms > Edit | | | |
|-------------------------|---------------|-----------------------------------|------|
| General | Advanced | | |
| | Don't play | y announce for first participant: | |
| | | No incoming notification: | |
| | An | nounce number of participants: | |
| Record | name and anno | ounce when joining and leaving: | No 🔻 |
| | | Recording: | |
| Max participants : | | 0 | |
| | | Preprocess subroutine : | |
| | | | |

Fig. 5.7: Conference room configuration advanced tab

- Don't play announce for first participant: First user joining will not get any announce.
- *No incoming notification*: Users will not hear incoming announces. Deactivates the sound when user enters / leaves conference. It also deactivates the name recording feature, but not the announce of number of participants.
- Announce number of participants: Announce user(s) count on joining a conference.
- *Record name and announce when joining and leaving*: The user is allowed to record his name that will be heard by the other conference attendees. Can be reviewed afert record (yes) or not (No Review).

- *Recording*: This conference room is recorded.
- Max participants: Define the maximum number of participants, default to 0.
- Preprocess subroutine: See Subroutine.

5.7 CTI Server

The CTI server configuration options can be found in the web-interface under the services tab.

5.7.1 General Options

The general options allow the administrator to manage network connections between the CTI server and the clients.

The section named STARTTLS options allows the administrator to enable encrypted communications between the clients and xivo-ctid and specify the certificate and private keys to use.

If no certificate and private key is configured, xivo-ctid will use the ones located in /usr/share/xivo-certs.

STARTTLS options

Parting options are used to isolate XiVO users from each other. These options should be used when using the same XiVO for different enterprises.

Context separation is based on the user's line context. A user with no line is not the member of any context and will not be able to do anything with the CTI client.

Note: xivo-dird must be restarted to take into account this parameter.

Contexts Separation:

5.7.2 Authentication

xivo-ctid uses xivo-auth to authenticate users. The default authentication backend is *xivo_user*. To change the authentication backend, add a configuration file in */etc/xivo-ctid/conf.d* with the following content:

auth: backend: backend_name

where backend name is the name of an enabled xivo-auth Backends Plugins.

| Presence Name | Description | Action |
|---------------|-------------------|--------------|

| chat | Chat | ۵ 🙁 |
| available | Disponible | \checkmark |

5.7.3 Presence Option

In the *Status* menu, under *Presences*, you can edit presences group. The default presence group is *francais*. When editing a group, you will see a list of presences and their descriptions.

To use another presence group, you can edit the CTI profile you are using and select the appropriate presence group for that profile.

| Profiles > Edit CTI profile | | | | | |
|-----------------------------|-------------------|------------------|------------|------------------------------------|---------|
| General Xlets Preferences | | | | | |

Actions

| action | param |
|-----------------------------|------------------|
| Enable DND | {`true`,`false`} |
| Pause agent in all queues | |
| Unpause agent in all queues | |
| Agent logoff | |

5.7.4 Enable encryption

To enable encryption of CTI communications between server and clients, you have to enable STARTTLS in CTI Server \rightarrow General settings \rightarrow General

Custom certificates can be added in *Configuration* \rightarrow *Certificates* and used in *CTI Server* \rightarrow *General settings* \rightarrow *General*

In your XiVO Client, in the menu XiVO Client \rightarrow Configure \rightarrow Connection, click on the lock icon.

Note: A client which chooses to use encryption will not be able to connect to a server that does not have STARTTLS enabled.

Warning: For now, there is no mechanism for strong authentication of the server. The connection is encrypted, but the identity of the server is not verified.

5.7.5 CTI profiles

The CTI profiles define which features are made available to a user. You can configure which profile will be used by a user in the menu *IPBX* \rightarrow *PBX Settings* \rightarrow *Users*:

You can also customize the default profiles or add new profiles in the menu *CTI Server* \rightarrow *Profiles*:

Xlets

To choose which features are available to users using a profile, you have to select which *Xlets* will be available.

The Position attribute determines how the Xlets will be laid out:

- *dock* will display a Xlet in its own frame. This frame can have some options:
 - Floating means that the frame can be detached from the main window of the CTI Client.
 - Closable means that the Xlet can be hidden
 - Movable means that the Xlet can be moved (either inside the main window or outside)
 - Scroll means that the Xlet will display a scroll bar if the Xlet is too large.
- *grid* will display a Xlet inside the main window, and it will not be movable. Multiple *grid* Xlets will be laid out vertically (the second below the first).
- *tab* will display a Xlet inside a tab of the Xlet *Tabber*. Thus the Xlet *Tabber* is required and can't be in a *tab* position.

The *Number* attribute gives the order of the Xlets, beginning with 0. The order applies only to Xlets having the same *Position* attribute.

5.8 Display customer informations

5.8.1 Sheet Configuration

Sheets can be defined under Services \rightarrow CTI Server \rightarrow Models in the web interface. Once a sheet is defined, it has to be assigned to an event in the Services \rightarrow CTI Server \rightarrow Events menu.

Model The model contains the content of the displayed sheet.

Event Events are actions that trigger the defined sheet. A sheet can be assigned to many events. In that case, the sheet will be raised for each event.

| General settings General | Model | Description | Action |
|--|----------|--------------------------|--------|
| rofiles | XiVO | Modèle de fiche de base. | |
| itatus resences | basic | | |
| one hints | customer | | ۵ 🗶 |
| Directories Definitions | demoweb | Montée d'uri | ۵ 🗶 |
| everse directories rect directories splay filters heets odels rents | | | |

General settings

Models > Update model

| General settings | Sheet Systray Actions |
|------------------|--------------------------|
| | Name : XiVO |
| | Focus: |
| | Description |
| | Modèle de fiche de base. |
| | |
| | |

You must give a name to your sheet to be able to select it later.

The Focus checkbox is deprecated and will be remove in next version.

Sheets

Sheets allows to list different fields and associated content to be displayed in XivoCC application such as *CC Agent*. The information will be automatically laid out in a linear fashion and will be read-only.

List of fields

Default XiVO sheet example :

Each field is represented by the following parameters :

| Mode | Models > Update model | | | | | | | | | | | |
|------|-----------------------|--------------------------|---------|------------|---------------|-----------------------|----------------|--|--|--|--|--|
| Gen | eral settings | Sheet | Systray | Actions | | | | | | | | |
| | | Disabled Qt interface | | | | | | | | | | |
| | Field title | | | Field type | Default value | Display value | • | | | | | |
| | Nom | | | title • | | {xivo-calleridname} | ۲ | | | | | |
| | Numéro | | | text 🔻 | | {xivo-calleridnum} | ۲ | | | | | |
| | Origine | | | text 🔻 | | {xivo-origin} | ۲ | | | | | |
| | lien | | | url 🔻 | | https://192.168.3.252 | ۲ | | | | | |
| | dp-numapp | | | text • | | {dp-numero-appelant | (\mathbf{x}) | | | | | |

- Field title : name of your line used as label on the sheet.
- Field type : define the type of field displayed on the sheet. Supported field types :
 - title : to create a title on your sheet
 - text : show a text
 - url : a simple url link, open your default browser.
 - urlx : an url button not implemented
 - phone : create a tel: link, you can click to call on your sheet. not implemented
 - form : show the form from an ui predefined. not implemented
- Default value : if given, this value will be used when all substitutions in the display value field fail.
- **Display value** : you can define text, variables or both. See the *variable list* for more information.

Variables

Three kinds of variables are available :

- xivo- prefix is reserved and set inside the CTI server:
 - xivo-where for sheet events, event triggering the sheet
 - *xivo-origin* place from where the lookup is requested (did, internal, forcelookup)
 - xivo-direction incoming or internal
 - xivo-did DID number
 - xivo-calleridnum
 - xivo-calleridname
 - xivo-calleridrdnis contains information whether there was a transfer
 - xivo-calleridton Type Of Network (national, international)
 - xivo-calledidnum
 - xivo-calledidname
 - *xivo-ipbxid* (*xivo-astid* in 1.1)
 - xivo-directory : for directory requests, it is the directory database the item has been found

- xivo-queuename queue called
- xivo-agentnumber agent number called
- xivo-date formatted date string
- xivo-time formatted time string, when the sheet was triggered
- *xivo-channel* asterisk channel value (for advanced users)
- *xivo-uniqueid* asterisk uniqueid value (for advanced users)
- *db* prefixed variables are defined when the reverse lookup returns a result.

For example if you want to access to the reverse lookup full name, you need to define a field fullname in the directory definition, mapping to the full name field in your directory. The {db-fullname} will be replaced by the caller full name. Every field of the directory is accessible this way.

• *dp*- prefixed ones are the variables set through the dialplan (through UserEvent application)

For example if you want to access from the dialplan to a variable dp-test you need to add in your dialplan this line (in a subroutine):

```
UserEvent(dialplan2cti,UNIQUEID: ${UNIQUEID},CHANNEL: ${CHANNEL},
→VARIABLE: test,VALUE: "Salut")
```

The {dp-test} displays Salut.

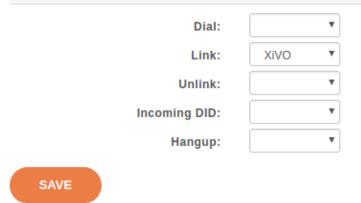

Event configuration

You can configure a sheet when a specific event is called. For example if you want to receive a sheet when an agent answers to a call, you can choose a sheet model for the Link event.

The following events are available :

- Dial: When the member's phone starts ringing for calls on a group or queue or when the user receives a call
- Link: When a user or agent answers a call
- Unlink: When a user or agent hangup a call received from a queue
- Incoming DID: Received a call in a DID
- Hangup: Hangup the call

Sheet Events

The informations about a call are displayed via the XiVO Client on forms called sheets.

5.8.2 Example: Display a Web page when an agent answers a call

The first step is to assign the URL to a dialplan variable. Go in the Services \rightarrow IPBX \rightarrow Configuration files and create a new file called setsheeturl.conf. In this file, put the following:

You can replace documentation.xivo.solutions by the URL you want.

The second step is to set the URL when the call is queued. To do that, we will use a preprocessing subroutine. This is configured in the queue configuration : go to Services \rightarrow Call center \rightarrow Queues and edit the queue. Set the field Preprocessing subroutine to setsheeturl (the same as above).

The third step is to configure the sheet to open the wanted URL. Go to Services \rightarrow CTI Server \rightarrow Sheets \rightarrow Models and create a new sheet. Keep the default for everything except the Action tab, add a field and set it to {dp-mysheeturl} (the same as above).

The fourth and final step is to trigger the sheet when the agent answers the queued call. Go to Services \rightarrow CTI Server \rightarrow Sheets \rightarrow Events and link the event Agent linked to the sheet you just created.

That's it, you can assign agents to your queue, log the agents and make them answer calls with the XiVO Client opened, and your browser should open the specified URL.

5.9 Devices

5.9.1 Synchronize a device

First you have to display the list of devices.

Fig. 5.8: Click on the synchronize button for a device.

| MAC \$ | IP 🌲 | Phone number | Entity | Vendor 🖨 | Model 🌲 | Plugin | Action |
|--------------------------|-------------|--------------|--------|----------|---------|-----------------------|---------|
| 00:04:13:70:31:46 | 10.70.0.100 | 1010 | xivo | Snom | 720 | xivo-snom-8.7.5.35 | 2 9 × × |
| o0:08:5d:34:6a:17 | 10.70.0.101 | - | - | Aastra | 6757i | xivo-aastra-3.3.1-SP4 | 2 9 Ø X |
| 00:15:65:b2:e2:4e | 10.70.0.104 | 1020 | xivo | Yealink | T23G | xivo-yealink-v81 | 2 9 Ø X |
| 00:15:65:c4:c2:73 | 10.70.0.105 | 1030 | xivo | Yealink | T46S | xivo-yealink-v81 | 3 9 × × |

Fig. 5.9: List devices

You will see a pop-up to confirm synchronization Click on the <ok> button.

You must wait until the full synchronization process has completed to determine the state returned back from the device. This can take several seconds. It is important to wait and do nothing during this time.

If synchronization is successful, a blue information balloon notifies you of success.

If synchronization fails, a red information balloon warns you of failure.

Fig. 5.16: Mass synchronization request sent successfully

An example of *adding a source* and *configuring source access* is made for each type of source:

5.10.1 XiVO directories

This type of directory is used to query the users of a XiVO. On a fresh install, the local XiVO is already configured. The URI field for this type of directory should be the base URL of a *xivo-confd* server.

This directory type matches the xivo backend in xivo-dird.

Available fields

- id
- agent_id
- line_id
- firstname
- lastname
- email
- exten
- context
- mobile_phone_number
- userfield
- description
- voicemail_number

Example

Adding a source

Configuring source access

Here is an example of a configuration where the userfield was used as a free field to store the DID number of the user and the description to store it's location.

| Directories Servers > E | Edit |
|-------------------------|-----------------------|
| Directory name: | xivo |
| Туре: | XIVO |

| SAVE | |

Fig. 5.17: Configuration \rightarrow Management \rightarrow Directories

5.10.2 LDAP

XiVO offers the possibility to integrate LDAP servers. Once configured properly, you'll be able to search your LDAP servers from your XiVO client and from your phones (if they support this feature).

Note: This page describes how to add LDAP servers as sources of contacts. For other sources of contacts, see *Directories*.

Add a LDAP Server

You can add a LDAP server by clicking on the add button at the top right corner of the *Configuration* \rightarrow *Management* \rightarrow *LDAP Servers* page. You'll then be shown this page:

Enter the following information:

- Name: the server's display name
- Host: the hostname or IP address
- Port: the port number (default: 389)
- Security layer: select SSL if it is activated on your server and you want to use it (default: disabled)
 - SSL means TLS/SSL (doesn't mean StartTLS) and port 636 should then be used
- Protocol version: the LDAP protocol version (default: 3)

Warning: When editing an LDAP server, you'll have to restart the CTI server for the changes to be taken into account.

Fig. 5.19: Adding a LDAP server

Notes on SSL/TLS usage

If you are using SSL with an LDAP server that is using a CA certificate from an unknown certificate authority, you'll have to put the certificate file as a single file ending with .crt into /usr/local/share/ ca-certificates and run update-ca-certificates.

You also need to make sure that the /etc/ldap/ldap.conf file contains a line TLS_CACERT /etc/ssl/ certs/ca-certificates.crt.

After that, restart spawn-fcgi with service spawn-fcgi restart.

Also, make sure to use the FQDN of the server in the host field when using SSL. The host field must match exactly what's in the CN attribute of the server certificate.

Add a LDAP Filter

Next thing to do after adding a LDAP server is to create a LDAP filter via the Services \rightarrow IPBX configuration \rightarrow LDAP Filters page.

You can add a LDAP filter by clicking on the add button at the top right of the page. You'll then be shown this page:

Enter the following information:

- Name: the filter's display name
- LDAP server: the LDAP server this filter applies to
- User: the dn of the user used to do search requests
- Password: the password of the given user
- Base DN: the base dn of search requests
- Filter: if specified, it replace the default filter

| LDAP filters > Ad | d |
|-------------------|----------------------------------|
| Nam | test |
| LDAP Serve | er: debian-Idap (192.168.32.194) |
| Use | er: uid=alice,ou=people |
| Passwor | rd: foobar |
| Base D | N: ou=people,dc=example,dc=org |
| Filte | |
| Des | scription: |
| SAVE | |

Fig. 5.20: Adding a LDAP Filter

Use a Custom Filter

In some cases, you might have to use a custom filter for your search requests instead of the default filter.

In custom filters, occurrence of the pattern %Q is replaced by what the user entered on its phone.

Here's some examples of custom filters:

- cn=*%Q*
- &(cn=*%Q*)(mail=*@example.org)
- | (cn=*%Q*) (displayName=*%Q*)

Add a Directory Definition

The next step is to add a directory definition for the LDAP filter you just created. See the *directories* section for more information.

Here's an example of an LDAP directory definition:

If a custom filter is defined in the LDAP filter configuration, the fields in *direct match* will be added to that filter using an &. To only use the *filter* field of your LDAP filter configuration, do not add any *direct match* fields in your directory definition.

Example:

- Given an LDAP filter with *filter* st=Canada
- Given a directory definition with a direct match cn , o
- Then the resulting filter when doing a search will be & (st=Canada) (| (cn=*%Q*) (o=*%Q*))

Definitions > Update directories

| Name: | test | | |
|-------------------------------|--------------------|---|---|
| URI: | Idapfilter://test | ¥ | |
| Delimiter: | | | |
| Direct match: | cn,telephoneNumber | | |
| Match reverse directories: | | | |
| Mapped fields: | | | |
| Fieldname | Value | | ÷ |
| display_name | {cn} | | ۲ |
| phone | {telephoneNumber} | | ۲ |
| firstname | {givenName} | | ۲ |
| lastname | {sn} | | ۲ |
| Descriptio | on | | |

You need to restart the Dird server to apply changes.

SAVE

Fig. 5.21: Services \rightarrow IPBX \rightarrow IPBX configuration \rightarrow LDAP filters

5.10.3 CSV File directories

The source file of the directory must be in CSV format. You will be able to choose the headers and the separator in the next steps. For example, the file will look like:

```
title|firstname|lastname|displayname|society|mobilenumber|email
mr|Emmett|Brown|Brown Emmett|DMC|5555551234|emmet.brown@dmc.example.com
```

This directory type matches the *csv* backend in *xivo-dird*.

For file directories, the *Direct match* and the *Match reverse directories* must be filled with the name of the column used to match entries.

Available fields

Available fields are the one's contained in the CSV file.

Example

csv-phonebook.csv:

```
title|firstname|lastname|displayname|society|phone|email
mr|Emmett|Brown|Brown Emmett|DMC|5555551234|emmet.brown@dmc.example.com
ms|Alice|Wonderland|Wonderland Alice|DMC|5555551235|alice.wonderland@dmc.example.
→com
```

Adding a source

| Directories Se | rvers > | Add |
|----------------|----------|-----------------------|
| Directory | name: | csv-phonebook |
| | Туре: | CSV file • |
| | URI: | /data/csv-phonebook |
| l l | Descript | ion |
| Contacts | | is of the society DMC |
| SAVE | | |

Configuring source access

5.10.4 CSV Web service directories

The data returned by the Web service must have the same format than the file directory. In the same way, you will be able to choose the headers and the separator in the next step.

Definitions > Update directories

| Name: | dmc | |
|-------------------------------|--------------------------------------|---|
| URI: | file://file://data/csv-phonebook.csv | • |
| Delimiter: | 1 | |
| Direct match: | displayname | |
| Match reverse directories: | phone | |

Mapped fields:

| Fieldname | Value | ÷ |
|--------------------|-------------------------------------|---|
| directory | DMC directory | × |
| display_name | {title} {displayname} | × |
| email | {email} | ۲ |
| firstname | {firstname} | ۲ |
| lastname | {lastname} | ۲ |
| phone | {phone} | ۲ |
| society | {society} | ۲ |
| title | {title} | × |
| Description | | |
| You need to restar | t the Dird server to apply changes. | |

SAVE

This directory type matches the CSV web service backend in xivo-dird.

For web service directories, the *Direct match* and the *Match reverse directories* must be filled with the name of the HTTP query parameter that will be used when doing the HTTP requests.

Note that the CSV returned by the Web service is not further processed.

Manual configuration needs to be done to use a secure (SSL) connection. See CSV web service for more details.

Available fields

Available fields are the ones contained in the CSV result.

Example

http://example.org:8000/ws-phonebook return csv:

```
title|firstname|lastname|displayname|society|phone|email
mr|Emmett|Brown|Brown Emmett|DMC|5555551234|emmet.brown@dmc.example.com
ms|Alice|Wonderland|Wonderland Alice|DMC|5555551235|alice.wonderland@dmc.example.
→com
```

Adding a source

| SAVE | | |

Fig. 5.24: Configuration \rightarrow Management \rightarrow Directories

Configuring source access

Given you have the following directory definition:

- Direct match : search
- Match reverse directories : phone

When a direct lookup for "Alice" is performed, then the following HTTP request:

```
GET /ws-phonebook?search=Alice HTTP/1.1
```

is emitted. When a reverse lookup for "5555551234" is performed, then the following HTTP request:

GET /ws-phonebook?phone=5555551234 HTTP/1.1

is emitted. On the reverse lookup, a filtering is performed on the result. In this example, it should have phone as column.

Fig. 5.25: Services \rightarrow CTI Server \rightarrow Directories \rightarrow Definitions

5.10.5 Phonebook directories

This type of directory source is the internal phonebook of a XiVO. The URI field is the one used to query the phonebook.

This directory type matches the *phonebook* backend in *xivo-dird*.

Available fields

General phone book section

These fields are set in the General tab of the phone book.

- phonebook.description
- phonebook.displayname
- phonebook.email
- phonebook.firstname
- phonebook.fullname (this value is automatically generated as "*<firstname> <lastname>*", e.g. "John Doe")
- phonebook.lastname
- phonebook.society
- phonebook.title
- phonebook.url

Phone numbers

These are the different phone numbers that are available

- phonebooknumber.fax.number
- phonebooknumber.home.number
- phonebooknumber.mobile.number
- phonebooknumber.office.number
- phonebooknumber.other.number

Addresses

Each configured address can be accessed

Address uses the following syntax phonebookaddress.[location].[field], e.g. phonebookaddress.office.zipcode.

Locations

- home
- office
- other

Fields

- address1
- address2
- city
- country
- state

• zipcode

Example

Adding a source

| De | scription |
| , | KiVO phonebook |
| SAVE | |

Fig. 5.26: Configuration \rightarrow Management \rightarrow Directories

URI:http://localhost/service/ipbx/json.php/private/pbx_services/phonebook

Configuring source access

Default phonebook is set in *Directories -> Definitions -> xivodir*.

Note: Phone IP should be in the authorized subnet to access the directories. See Remote directory.

5.10.6 Adding a source

Note: See *LDAP* for adding this source.

You can add new data sources via the *Configuration* \rightarrow *Management* \rightarrow *Directories* page.

- Directory name: the name of the directory
- *Type*: there are 4 types of directory:
 - XiVO
 - CSV File
 - CSV Web service
 - Phonebook
- URI: the data source
- Description: (optional) a description of the directory

| xivodir | | | |
|--|--|--|--|
| | | | |
| URI: http://localhost/service/ipbx/json.php/private/pbx_services/phonebook | | | |
| | | | |
| phonebook.firstname,phonebook.lastname | | | |
| phonebooknumber.office.number,phoneboo | | | |
| | | | |
| Value | Ŧ | | |

Fig. 5.27: Services \rightarrow CTI Server \rightarrow Directories \rightarrow Definitions

SAVE

5.10.7 Configuring source access

Go in Services \rightarrow CTI Server \rightarrow Directories \rightarrow Definitions and add a new directory definition.

- Name: the name of the directory definition
- URI: the data source
- Delimiter: (optional) the field delimiter in the data source
- *Direct match*: the list used to match entries for direct lookup (comma separated)
- Match reverse directories: (optional) the list used to match entries for reverse lookup (comma separated)
- Mapped fields: used to add or modify columns in this directory source
 - Fieldname: the identifier for this new field
 - Value: a python format string that can be used to modify the data returned from a data source

Reverse lookup

It's possible to do reverse lookups on incoming calls to show a better caller ID name when the caller is in one of our directories.

Reverse lookup will only be tried if at least one of the following conditions is true:

- The caller ID name is the same as the caller ID number
- The caller ID name is "unknown"

Also, reverse lookup is performed after caller ID number normalization (since XiVO 13.11).

To enable reverse lookup, you need to add an entry in Mapped fields:

- *Fieldname*: reverse
- Value: the header of your data source that you want to see as the caller ID on your phone on incoming calls

Example

- *Match reverse directories*: phonebooknumber.office.number, phonebooknumber.mobile. number, phonebooknumber.home.number
- *Fieldname*: reverse
- Value: phonebook.society

This configuration will show the contact's company name on the caller ID name, when the incoming call will match office, mobile or home number.

Phone directory

Phone directory takes 2 Fieldname by default:

- display_name: the displayed name on the phone
- phone: the number to call

Examples:

You will find below some useful configurations of Mapped fields.

| Definitions > Update dire | ectories | |
|----------------------------|---|---|
| Name: | xivodir | |
| URI: | http://localhost/service/ipbx/ison.php/private/pbx services/phonebook | |
| Delimiter: | | |
| Direct match: | phonebook.firstname,phonebook.lastname | |
| Match reverse directories: | phonebooknumber.office.number,phoneboa | |
| Mapped fields: | | |
| Fieldname | Value | (|
| mail | {phonebook.email} | * |
| lastname | {phonebook.lastname} | ۲ |
| fullname | {phonebook.fullname} | ۲ |
| phone | {phonebooknumber.office.number | ۲ |
| reverse | {phonebook.society} | ۲ |
| firstname | {phonebook.firstname} | ۲ |
| company | {phonebook.society} | ۲ |
| directory | Répertoire XiVO Externe | ۲ |
| nom | {phonebook.firstname} {phonebox | ۲ |
| name | {phonebook.firstname} {phoneboc | ۲ |

Fig. 5.28: Services \rightarrow CTI Server \rightarrow Directories \rightarrow Definitions

Adding a name field from firstname and lastname

Given a configuration where the directory source returns results with fields firstname and lastname. To add a *name* column to a directory, the administrator would add the following *Mapped fields*:

- Fieldname: name
- Value: {firstname} {lastname}

Prefixing a field

Given a directory source that need a prefix to be called, a new field can be created from an exising one. To add a prefix 9 to the numbers returned from a source, the administrator would add the following *Mapped fields*:

- Fieldname: number
- Value: 9{number}

Adding a static field

Sometimes, it can be useful to add a field to the search results. A string can be added without any formatting. To add a *directory* field to the *xivodir* directory, the administrator would add the following *Mapped fields*:

- Fieldname: directory
- Value: XiVO internal directory

5.10.8 Configuring source display

XiVO Client

Edit the default display filter or create your own in Services \rightarrow CTI Server \rightarrow Directories \rightarrow Display filters.

Each line in the display filter will result in a header in your XiVO Client.

- Field title: text displayed in the header.
- Field type: type of the column, this information is used by the XiVO Client. (see type description)
- Default value: value that will be used if this field is empty for one of the configured sources.
- *Field name*: name of the field in the directory definitions. The specified names should be available in the configured sources. To add new column name to a directory definition see above.

Phone

The only way to configure display phone directory is through XiVO dird configuration.

5.10.9 Adding a directory

To include a directory in direct directory definition:

- 1. Go to Services \rightarrow CTI Server \rightarrow Directories \rightarrow Direct directories.
- 2. Edit your context.
- 3. Select your display filter.
- 4. Add the directories in the Directories section.

To include a directory in reverse directory definition:

| | Name: | default |] | | |
|------------|----------|------------|------------------------|------------|---|
| ield title | | Field type | Default value | Field name | ٠ |
| Name | | name | | name | × |
| Number | | number | | number | × |
| Favorite | | favorite | | favorite | ۲ |
| Personal | | personal | | | ۲ |
| Source | | | | directory | × |
| Mobile | | callable | | mobile | × |
| SDA | | callable | | sda | × |
| Location | | | | location | × |
| | You need | | rver to apply changes. | | |

Fig. 5.29: Services \rightarrow CTI Server \rightarrow Directories \rightarrow Display filters

- 1. Go to Services \rightarrow CTI Server \rightarrow Directories \rightarrow Reverse directories.
- 2. Add the directories to include to reverse lookups in the Related directories section.

5.10.10 Applying changes

To reload the directory configuration for XiVO Client, phone lookups and reverse lookups, use *one* of these methods:

- Services \rightarrow IPBX \rightarrow Control \rightarrow Restart Dird server
- console service xivo-dird restart

5.11 Directed Pickup

Directed pickup allows a user to intercept calls made to another user.

For example, if a user with number 1001 is ringing, you can dial *81001 from your phone and it will intercept (i.e. pickup) the call to this user.

The extension prefix used to pickup calls can be changed via the Services \rightarrow IPBX \rightarrow IPBX services \rightarrow Extensions page.

5.11.1 Custom Line Limitation

There is a case where directed pickup does not work, which is the following:

```
Given you have a user U with a line of type "customized"

Given this custom line is using DAHDI technology

Given this user is a member of group G

When a call is made to group G

Then you won't be able to intercept the call made to U by pressing *8<line number.

→of U>
```

If you find yourself in this situation, you'll need to write a bit of dialplan.

For example, if you have the following:

- a user with a custom line with number 1001 in context default
- a custom line with interface DAHDI/g1/5551234

Then add the following, or similar:

```
[custom_lines]
exten = line1001,1,NoOp()
same = n,Set(__PICKUPMARK=1001%default)
same = n,Dial(DAHDI/g1/5551234)
same = n,Hangup()
```

And do a dialplan reload in the asterisk CLI.

Then, edit the line of the user and change the interface value to Local/line1001@custom_lines

Note that you'll need to update your dialplan if you update the number of the line or the context.

5.12 Entities

5.12.1 Purpose

In some cases, as the telephony provider, you want different independent organisations to have their telephony served by your XiVO, e.g. different departments using the same telephony infrastructure, but you do not want each organisation to see or edit the configuration of other organisations.

5.12.2 Configuration

In *Configuration* \rightarrow *Entities*, you can create entities, one for each independant organisation.

In Configuration \rightarrow Users, you can select an entity for each administrator.

Note: Once an entity is linked with an administrator, it can not be deleted. You have to unlink the entity from all administrator to be able to delete it.

For the new entity to be useful, you need to create contexts in this entity. You may need:

- an Internal context for users, groups, queues, etc.
- an Incall context for incoming calls
- an Outcall context for outgoing calls, which should be included in the Internal context for the users to be able to call external numbers

5.12.3 Limitations

Global Fields

Some fields are globally unique and will collide when the same value is used in different entities:

- User CTI login
- Agent number
- Queue name
- Context name

An error message will appear when creating resources with colliding parameters, saying the resource already exists, even if the entity-linked administrator can not see them.

Affected Lists

Only the following lists may be filtered by entity:

- Lines
- Users
- Devices
- Groups
- Voicemails
- Conference Rooms
- Incoming calls
- Call filters

- Call pickups
- Schedules
- Agents
- Queues

For the devices:

- The filtering only applies to the devices associated with a line.
- The devices in autoprov mode or not configured mode are visible by every administrator.

REST API

The REST API does not have the notion of entity. When creating a resource without context via REST API, the resource will be associated to an arbitrary entity. Affected resources are:

- Contexts
- Call filters
- Group pickups
- Schedules
- Users

5.13 Fax

5.13.1 Fax transmission

It's possible to send faxes from XiVO using the fax Xlet in the XiVO client.

The file to send must be in PDF format.

5.13.2 Fax reception

Adding a fax reception DID

If you want to receive faxes from XiVO, you need to add incoming calls definition with the *Application* destination and the *FaxToMail* application for every DID you want to receive faxes from.

This applies even if you want the action to be different from sending an email, like putting it on a FTP server. You'll still need to enter an email address in these cases even though it won't be used.

Note that, as usual when adding incoming call definitions, you must first define the incoming call range in the used context.

Changing the email body

You can change the body of the email sent upon fax reception by editing /etc/xivo/mail.txt.

The following variable can be included in the mail body:

• $\ensuremath{\texttt{\$}}$ (dstnum) s: the DID that received the fax

If you want to include a regular percent character, i.e. %, you must write it as %% in mail.txt or an error will occur when trying to do the variables substitution.

The agid service must be restarted to apply changes:

| 8 | XiVO Client 15.10.2-12-gef3f9f6 (Client profile) | |
|----------------|--|--------|
| <u>X</u> iVO C | lient <u>H</u> elp | |
| \odot | | |

| Customized | SAVE | |
| | | |

service xivo-agid restart

Changing the email subject

You can change the subject of the email sent upon fax reception by editing $/etc/xivo/asterisk/xivo_fax.conf$.

Look for the [mail] section, and in this section, modify the value of the subject option.

The available variable substitution are the same as for the email body.

The agid service must be restarted to apply changes:

service xivo-agid restart

Changing the email from

You can change the from of the email sent upon fax reception by editing /etc/xivo/asterisk/xivo_fax. conf.

Look for the [mail] section, and in this section, modify the value of the email_from option.

The agid service must be restarted to apply changes:

service xivo-agid restart

Changing the email realname

You can change the realname of the email sent upon fax reception by editing /etc/xivo/asterisk/ xivo_fax.conf.

Look for the [mail] section, and in this section, modify the value of the email_realname option.

The agid service must be restarted to apply changes:

```
service xivo-agid restart
```

Using the advanced features

The following features are only available via the /etc/xivo/asterisk/xivo_fax.conf configuration file. They are not available from the web-interface.

The way it works is the following:

- you first declare some backends, i.e. actions to be taken when a fax is received. A backend name looks like mail, ftp_example_org or printer_office.
- once your backends are defined, you can use them in your destination numbers. For example, when someone calls the DID 100, you might want the ftp_example_org and mail backend to be run, but otherwise, you only want the mail backend to be run.

Here's an example of a valid /etc/xivo/asterisk/xivo_fax.conf configuration file:

```
[general]
tiff2pdf = /usr/bin/tiff2pdf
mutt = /usr/bin/mutt
lp = /usr/bin/lp
[mail]
subject = FAX reception to %(dstnum)s
content_file = /etc/xivo/mail.txt
email_from = no-reply+fax@xivo.solutions
email_realname = Service Fax
[ftp_example_org]
host = example.org
username = foo
password = bar
directory = /foobar
[dstnum_default]
dest = mail
[dstnum_100]
dest = mail, ftp_example_org
```

The section named dstnum_default will be used only if no DID-specific actions are defined.

After editing /etc/xivo/asterisk/xivo_fax.conf, you need to restart the agid server for the changes to be applied:

service xivo-agid restart

Using the FTP backend

The FTP backend is used to send a PDF version of the received fax to an FTP server.

An FTP backend is always defined in a section beginning with the ftp prefix. Here's an example for a backend named ftp_example_org:

```
[ftp_example_org]
host = example.org
port = 2121
username = foo
password = bar
directory = /foobar
convert_to_pdf = 0
```

The port option is optional and defaults to 21.

The directory option is optional and if not specified, the document will be put in the user's root directory.

The convert_to_pdf option is optional and defaults to 1. If it is set to 0, the TIFF file will not be converted to PDF before being sent to the FTP server.

The uploaded file are named like \${XIVO_SRCNUM}-\${EPOCH}.pdf.

Using the printer backend

To use the printer backend, you must have the cups-client package installed on your XiVO:

\$ apt-get install cups-client

The printer backend uses the lp command to print faxes.

A printer backend is always defined in a section beginning with the printer prefix. Here's an example for a backend named printer_office:

```
[printer_office]
name = office
convert_to_pdf = 1
```

When a fax will be received, the system command lp -d office <faxfile> will be executed.

The convert_to_pdf option is optional and defaults to 1. If it is set to 0, the TIFF file will not be converted to PDF before being printed.

Warning: You need a CUPS server set up somewhere on your network.

Using the mail backend

By default, a mail backend named mail is defined. You can define more mail backends if you want. Just look what the default mail backend looks like.

5.13.3 Fax detection

XiVO does not currently support Fax Detection. A workaround is described in the Fax detection section.

5.13.4 Using analog gateways

XiVO is able to provision Cisco SPA122 and Linksys SPA2102, SPA3102 and SPA8000 analog gateways which can be used to connect fax equipments. This section describes the creation of custom template *for SPA3102* which modifies several parameters.

Note: With SPA ATA plugins >= v0.8, you should not need to follow this section anymore since all of these parameters are now set in the base templates of all, except for Echo_Canc_Adapt_Enable, Echo_Supp_Enable, Echo_Canc_Enable.

Note: Be aware that most of the parameters are or could be country specific, i.e. :

- · Preferred Codec,
- FAX Passthru Codec,
- RTP Packet Size,
- RTP-Start-Loopback Codec,
- Ring Waveform,
- Ring Frequency,
- Ring Voltage,
- FXS Port Impedance
- 1. Create a custom template for the SPA3102 base template:

```
cd /var/lib/xivo-provd/plugins/xivo-cisco-spa3102-5.1.10/var/templates/
cp ../../templates/base.tpl .
```

2. Add the following content before the </flat-profile> tag:

```
<!-- CUSTOM TPL - for faxes - START -->
{% for line_no, line in sip_lines.iteritems() %}
<!-- Dial Plan: L{{ line_no }} -->
<Dial_Plan_{{ line_no }}_ ua="na">([x*#].)</Dial_Plan_{{ line_no }}_>
<Call_Waiting_Serv_{{ line_no }}_ ua="na">No</Call_Waiting_Serv_{{ line_no }}_>
<Three_Way_Call_Serv_{{ line_no }}_ ua="na">No</Three_Way_Call_Serv_{{ line_no_
\hookrightarrow } }_>

<!-- CUSTOM TPL - for faxes - END -->
```

3. Reconfigure the devices with:

```
xivo-provd-cli -c 'devices.using_plugin("xivo-cisco-spa3102-5.1.10").

→reconfigure()'
```

4. Then reboot the devices:

Most of this template can be copy/pasted for a SPA2102 or SPA8000.

5.13.5 Using a SIP Trunk

Fax transmission, to be successful, *MUST* use G.711 codec. Fax streams cannot be encoded with lossy compression codecs (like G.729a).

That said, you may want to establish a SIP trunk using G.729a for all other communications to save bandwith. Here's a way to be able to receive a fax in this configuration.

Note: There are some prerequisites:

- your SIP Trunk must offer both G.729a and G.711 codecs
- your fax users must have a customized outgoing calleridnum (for the codec change is based on this variable)
- 1. We assume that outgoing call rules and fax users with their DID are created
- 2. Create the file /etc/asterisk/extensions_extra.d/fax.conf with the following content:

```
;; For faxes :
; The following subroutine forces inbound and outbound codec to alaw.
; For outbound codec selection we must set the variable with inheritance.
; Must be set on each Fax DID
[pre-incall-fax]
exten = s,1,NoOp(### Force alaw codec on both inbound (operator side) and_
outbound (analog gw side) when calling a Fax ###)
exten = s,n,Set(SIP_CODEC_INBOUND=alaw)
exten = s,n,Set(__SIP_CODEC_OUTBOUND=alaw)
exten = s,n,Return()
```

```
; The following subroutine forces outbound codec to alaw based on outgoing_

callerid number

; For outbound codec selection we must set the variable with inheritance.

; Must be set on each outgoing call rule

[pre-outcall-fax]

exten = s,1,NoOp(### Force alaw codec if caller is a Fax ###)

exten = s,n,GotoIf($["${CALLERID(num)}" = "0112697845"]?alaw:)

exten = s,n,GotoIf($["${CALLERID(num)}" = "0112697846"]?alaw:end)

exten = s,n(alaw),Set(__SIP_CODEC_OUTBOUND=alaw)

exten = s,n(end),Return()
```

3. For each Fax users' DID add the following string in the Preprocess subroutine field:

```
pre-incall-fax
```

4. For each Outgoing call rule add the the following string in the Preprocess subroutine field:

```
pre-outcall-fax
```

5.14 Graphics

The Services/Graphics section gives a historical overview of a XiVO system's activity based on snapshots recorded every 5 minutes. Graphics are available for the following resources :

- CPU
- Entropy
- Interruptions
- IRQ Stats
- System Load
- Memory Usage
- Open Files
- Open Inodes
- Swap Usage

Each section is presented as a series of 4 graphics : daily, weekly, monthly and yearly history. Each graphic can be clicked on to zoom. All information presented is read only.

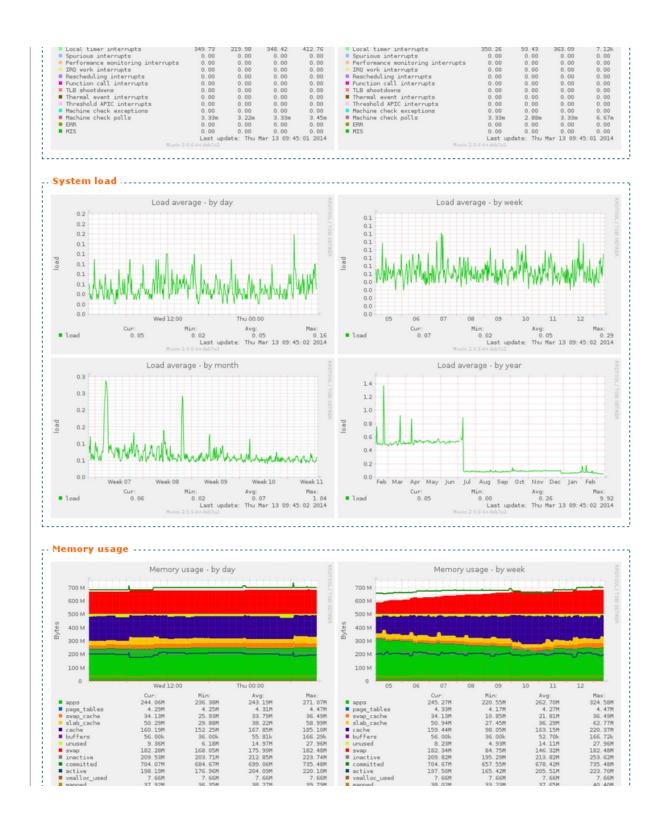

5.15 Groups

Groups are used to be able to call a set or users.

Group name cannot be general reserved in asterisk configuration.

5.16 Group Pickup

Pickup groups allow users to intercept calls directed towards other users of the group. This is done either by dialing a special extension or by pressing a function key.

5.16.1 Quick Summary

In order to be able to use group pickup you have to:

- Create a pickup group
- Enable an extension to intercept calls
- Add a function key to interceptors

5.16.2 Creating a Pickup Group

Pickup groups can be created in the Services \rightarrow IPBX \rightarrow Call management \rightarrow Call pickups page.

In the *general* tab, you can define a name and a description for the pickup group. In the *Interceptors* tab, you can define a list of users, groups or queues that can intercept calls. In the *Intercepted* tab, you can define a list of users, groups or queues that can be intercepted.

5.16.3 Enabling an Interception Extension

The pickup extension can be defined in the Services \rightarrow IPBX \rightarrow IPBX services \rightarrow Extensions page.

The extension used by group pickup is called *Group interception* it's default value is *8.

Warning: The extension must be enabled even if a function key is used.

5.16.4 Adding a Function Key to an Interceptor

To assign a function to an interceptor, go to Services \rightarrow IPBX \rightarrow IPBX settings \rightarrow Users, edit an interceptor and go to the Func Keys tab.

Add a new function key of type Group Interception and save.

5.17 Incall

5.17.1 General Configuration

You can configure incoming calls settings in Services \rightarrow IPBX \rightarrow Call Management \rightarrow Incoming calls.

DID (Direct Inward Dialing) Configuration

When a "+" character is prepended a called DID, the "+" character is discarded.

Example:

Bob has a DID with number 1000. Alice can call Bob by dialing either 1000 or +1000, without configuring another DID.

5.18 Interconnections

5.18.1 Interconnect two XiVO directly

Interconnecting two XiVO will allow you to send and receive calls between the users configured on both sides.

The steps to configure the interconnections are:

- Establish the trunk between the two XiVO, that is the SIP connection between the two servers
- Configure outgoing calls on the server(s) used to emit calls
- Configure incoming calls on the server(s) used to receive calls

For now, only SIP interconnections have been tested.

Establish the trunk

The settings below allow a trunk to be used in both directions, so it doesn't matter which server is A and which is B.

Consider XiVO A wants to establish a trunk with XiVO B.

On XiVO B, go on page Services \rightarrow IPBX \rightarrow Trunk management \rightarrow SIP Protocol, and create a SIP trunk:

```
Name : xivo-trunk
Username: xivo-trunk
Password: pass
Connection type: Friend
IP addressing type: Dynamic
Context: <see below>
```

Note: For the moment, Name and Username need to be the same string.

The Context field will determine which extensions will be reachable by the other side of the trunk:

- If Context is set to default, then every user, group, conf room, queue, etc. that have an extension if the default context will be reachable directly by the other end of the trunk. This setting can ease configuration if you manage both ends of the trunk.
- If you are establishing a trunk with a provider, you probably don't want everything to be available to everyone else, so you can set the Context field to Incalls. By default, there is no extension available in this context, so we will be able to configure which extension are reachable by the other end. This is the role of the incoming calls: making bridges from the Incalls context to other contexts.

On XiVO A, create the other end of the SIP trunk on the Services \rightarrow IPBX \rightarrow Trunk management \rightarrow SIP Protocol:

```
Name: xivo-trunk
Username: xivo-trunk
Password: pass
Identified by: Friend
Connection type: Static
Address: <XiVO B IP address or hostname>
Context: Incalls
```

Register tab:

```
Register: checked
Transport: udp
Username: xivo-trunk
Password: pass
Remote server: <XiVO B IP address or hostname>
```

On both XiVO, activate some codecs, $Services \rightarrow IPBX \rightarrow General Settings \rightarrow SIP protocol$, tab Signaling:

Enabled codecs: at least GSM (audio)

Warning: Without customizing the codecs, problems with sound quality or one-way sound may occur.

At that point, the Asterisk command sip show registry on XiVO B should print a line showing that XiVO A is registered, meaning your trunk is established.

Set the outgoing calls

The outgoing calls configuration will allow XiVO to know which extensions will be called through the trunk.

On the call emitting server(s), go on the page Services \rightarrow IPBX \rightarrow Call management \rightarrow Outgoing calls and add an outgoing call.

Tab General:

Trunks: xivo-trunk

Tab Exten:

```
Exten: **99. (note the period at the end) Stripnum: \mathbf{4}
```

This will tell XiVO: if any extension begins with **99, then try to dial it on the trunk xivo-trunk, after removing the 4 first characters (the **99 prefix).

The most useful special characters to match extensions are:

```
. (period): will match one or more characters X: will match only one character
```

You can find more details about pattern matching in Asterisk (hence in XiVO) on the Asterisk wiki.

Set the incoming calls

Now that we have calls going out from a XiVO, we need to route incoming calls on the XiVO destination.

Note: This step is only necessary if the trunk is linked to an Incoming calls context.

To route an incoming call to the right destination in the right context, we will create an incoming call in *Services* $\rightarrow IPBX \rightarrow Call \ management \rightarrow Incoming \ calls.$

Tab General:

```
DID: 101
Context: Incalls
Destination: User
Redirect to: someone
```

This will tell XiVO: if you receive an incoming call to the extension 101 in the context Incalls, then route it to the user someone. The destination context will be found automatically, depending on the context of the line of the given user.

So, with the outgoing call set earlier on XiVO A, and with the incoming call above set on XiVO B, a user on XiVO A will dial **99101, and the user someone will ring on XiVO B.

5.18.2 Interconnect XiVO with a known SIP Provider

Connection to global telephony network can be configured automatically in this version of XiVO. For instructions how to configure it manually, see *Interconnect XiVO with any VoIP provider*.

Requirements

This is a premium feature that is not included in XiVO and is not freely available. To enable it, please contact XiVO.Solutions customer support.

Overview

The SIP provider configuration can be applied from the SIP provider page.

Trunk management SIP Protocol SIP Provider IAX Protocol Customized

On this page, you will not see all the settings that will be applied, but only those that must be personalised.

| SIP Provider propertie | es |
|-----------------------------|---------------|
| Provider: | Orange BTIP V |
| Authentication username: | |
| Password: | |
| IP Address 1 | |
| IP Address 2 | |
| SAVE 9 | |

These settings will apply when you save the form:

- SIP trunk with the settings required by the provider will be created
- Data entered to the form will be included in the trunk
- If it is required by the provider, other XiVO settings will be changed. These settings can't be reverted by removing the trunk

Installation

- Open SIP Provider page from menu Services \rightarrow IPBX \rightarrow Trunk management \rightarrow SIP Provider
- Choose provider
- Fill up the form
- Save
- Some *manual steps* may be required to complete the configuration

5.18.3 Interconnect XiVO with any VoIP provider

When you want to send and receive calls to the global telephony network, one option is to subscribe to a VoIP provider. To receive calls, your XiVO needs to tell your provider that it is ready and to which IP the calls must

be sent. To send calls, your XiVO needs to authenticate itself, so that the provider knows that your XiVO is authorized to send calls and whose account must be credited with the call fare.

The steps to configure the interconnections are:

- · Establish the trunk between the two XiVO, that is the SIP connection between the two servers
- Configure outgoing calls on the server(s) used to emit calls
- Configure incoming calls on the server(s) used to receive calls

Establish the trunk

You need the following information from your provider:

- a username
- · a password
- the name of the provider VoIP server
- a public phone number

On your XiVO, go on page Services \rightarrow IPBX \rightarrow Trunk management \rightarrow SIP Protocol, and create a SIP/IAX trunk:

```
Name : provider_username
Username: provider_username
Password: provider_password
Connection type: Peer
IP addressing type: voip.provider.example.com
Context: Incalls (or another incoming call context)
```

Register tab:

```
Register: checked
Transport: udp
Name: provider_username
Username: provider_username
Password: provider_password
Remote server: voip.provider.example.com
```

Note: For the moment, Name and Username need to be the same value.

If your XiVO is behind a NAT device or a firewall, you should set the following:

Monitoring: Yes

This option will make Asterisk send a signal to the VoIP provider server every 60 seconds (default settings), so that NATs and firewall know the connection is still alive. If you want to change the value of this cycle period, you have to select the appropriate value of the following parameter:

Qualify Frequency:

At that point, the Asterisk command sip show registry should print a line showing that you are registered, meaning your trunk is established.

Set the outgoing calls

The outgoing calls configuration will allow XiVO to know which extensions will be called through the trunk.

Go on the page Services \rightarrow IPBX \rightarrow Call management \rightarrow Outgoing calls and add an outgoing call.

Tab General:

Trunks: provider_username

Tab Exten:

Exten: 418. (note the period at the end)

This will tell XiVO: if an internal user dials a number beginning with 418, then try to dial it on the trunk provider_username.

The most useful special characters to match extensions are:

```
. (period): will match one \mathbf{or} more characters X: will match only one character
```

You can find more details about pattern matching in Asterisk (hence in XiVO) on the Asterisk wiki.

Set the incoming calls

Now that we have calls going out, we need to route incoming calls.

To route an incoming call to the right destination in the right context, we will create an incoming call in *Services* $\rightarrow IPBX \rightarrow Call \ management \rightarrow Incoming \ calls.$

Tab General:

```
DID: your_public_phone_number
Context: Incalls (the same than configured in the trunk)
Destination: User
Redirect to: the_front_desk_guy
```

This will tell XiVO: if you receive an incoming call to the public phone number in the context Incalls, then route it to the user the_front_desk_guy. The destination context will be found automatically, depending on the context of the line of the given user.

5.18.4 Interconnect XiVO with a PBX via an ISDN link

The goal of this architecture can be one of:

- start a smooth migration between an old telephony system towards IP telephony with XiVO
- bring new features to the PBX like voicemail, conference, IVR etc.

First, XiVO is to be integrated transparently between the operator and the PBX. Then users or features are to be migrated from the PBX to the XiVO.

Warning: It requires a special call routing configuration on both the XiVO and the PBX.

Hardware

General uses

You must have an ISDN card able to support both the provider and PBX ISDN links.

Example : If you have two provider links towards the PBX, XiVO should have a 4 spans card : two towards the provider, and two towards the PBX.

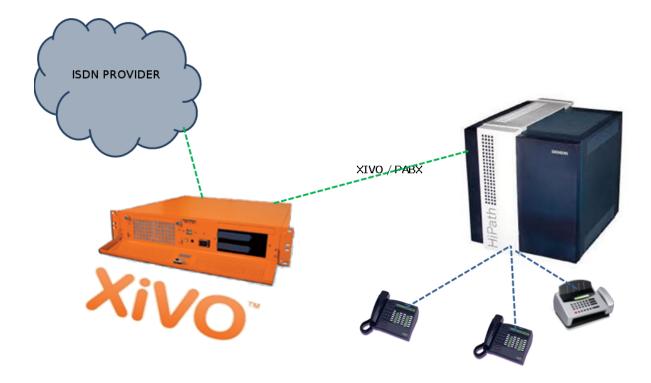

Fig. 5.32: Interconnect XiVO with a PBX

If you use two cards

If you use two cards, you have to :

- Use a cable for clock synchronization between the cards
- Configure the *wheel* to define the cards order in the system.

Please refer to the section Sync cable

Configuration

You have now to configure two files :

- 1. /etc/dahdi/system.conf
- 2. /etc/asterisk/dahdi-channels.conf

system.conf

You mainly need to configure the timing parameter on each span. As a general rule :

- Provider *span* XiVO will get the clock from the provider : the timing value is to be different from 0 (see /*etc/dahdi/system.conf* section)
- PBX *span* XiVO will provide the clock to the PBX : the timing value is to be set to 0 (see */etc/dahdi/system.conf* section)

Below is an example with two provider links and two PBX links:

```
# Span 1: TE4/0/1 "TE4XXP (PCI) Card 0 Span 1" (MASTER)
                    # Span towards Provider
span=1,1,0,ccs,hdb3
bchan=1-15,17-31
dchan=16
echocanceller=mg2,1-15,17-31
# Span 2: TE4/0/2 "TE4XXP (PCI) Card 0 Span 2"
span=2,2,0,ccs,hdb3  # Span towards Provider
bchan=32-46,48-62
dchan=47
echocanceller=mg2, 32-46, 48-62
# Span 3: TE4/0/3 "TE4XXP (PCI) Card 0 Span 3"
span=3,0,0,ccs,hdb3
                         # Span towards PBX
bchan=63-77,79-93
dchan=78
echocanceller=mg2, 63-77, 79-93
# Span 4: TE4/0/4 "TE4XXP (PCI) Card 0 Span 4"
span=4,0,0,ccs,hdb3
                     # Span towards PBX
bchan=94-108,110-124
dchan=109
echocanceller=mg2,94-108,110-124
```

dahdi-channels.conf

In the file /etc/asterisk/dahdi-channels.conf you need to adjust, for each span :

- group : the group number (e.g. 0 for provider links, 2 for PBX links),
- context : the context (e.g. from-extern for provider links, from-pabx for PBX links)

• signalling:pri_cpe for provider links, pri_net for PBX side

Warning: most of the PBX uses overlap dialing for some destination (digits are sent one by one instead of by block). In this case, the overlapdial parameter has to be activated on the PBX spans:

```
overlapdial = incoming
```

Below an example of /etc/asterisk/dahdi-channels.conf:

```
; Span 1: TE4/0/1 "TE4XXP (PCI) Card 0 Span 1" (MASTER)
group=0,11
context=from-extern
switchtype = euroisdn
signalling = pri_cpe
channel => 1-15, 17-31
; Span 2: TE4/0/2 "TE4XXP (PCI) Card 0 Span 2"
group=0, 12
context=from-extern
switchtype = euroisdn
signalling = pri_cpe
channel => 32-46,48-62
; PBX link #1
; Span 3: TE4/0/3 "TE2XXP (PCI) Card 0 Span 3"
group=2,13
context=from-pabx
                     ; special context for PBX incoming calls
overlapdial=incoming ; overlapdial activation
switchtype = euroisdn
signalling = pri_net ; behave as the NET termination
channel => 63-77, 79-93
; PBX link #2
; Span 4: TE4/0/4 "T4XXP (PCI) Card 0 Span 4"
group=2,14
context=from-pabx ; special context for PBX incoming calls
overlapdial=incoming ; overlapdial activation
switchtype = euroisdn
signalling = pri_net ; behave as the NET termination
channel => 94-108,110-124
```

Passthru function

Route PBX incoming calls

We first need to create a route for calls coming from the PBX

Create a file named pbx.conf in the directory /etc/asterisk/extensions_extra.d/, # Add the following lines in the file:

```
[from-pabx]
exten = _X.,1,NoOp(### Call from PBX ${CARLLERID(num)} towards ${EXTEN} ###)
exten = _X.,n,Goto(default,${EXTEN},1)
```

This dialplan routes incoming calls from the PBX in the default context of XiVO. It enables call from the PBX : * towards a SIP phone (in default context) * towards outgoing destniation (via the to-extern context included in default context)

Create the to-pabx context

In the webi, create a context named to-pabx:

- Name : to-pabx
- Display Name : TO PBX
- Context type : Outcall
- Include sub-contexts : No context inclusion

This context will permit to route incoming calls from the XiVO to the PBX.

| Context | ts > Add | | | |
|---------|---|---|-------------------------------------|---------|
| General | Users | Groups Queues Cor | nference rooms Incoming calls | |
| | Name: splayed name: Entity: Context type: ub-contexts | to-pabx Vers PABX showroom V Outcall | | |
| | 0 items selected | Remove all | | Add all |
| | | | Appels entrants (from-extern) | + |
| | | | Appels internes (default) | + |
| | | | Appels sortants (to-extern) | + |
| | | | Keepcall (keepcall) | + |
| | | | loadtest (loadtest) | + |
| | | | Switchboard (switchboard_directory) | + |
| | | | world (world) | + |
| | Descrip | otion: | | |

Route incoming calls to PBX

In our example, incoming calls on spans 1 and 2 (spans pluged to the provider) are routed by from-extern context. We are going to create a default route to redirect incoming calls to the PBX.

Create an incoming call as below :

- DID : XXXX (according to the number of digits sent by the provider)
- Context : Incoming calls
- Destination : Customized

• Command : Goto(to-pabx,\${XIVO_DSTNUM},1)

| Incoming calls > | Add |
|----------------------|-----------------------------------|
| General Call po | ermissions Schedules |
| | ID: XXXX |
| Conte | xt: Appels entrants (from-extern) |
| Destinatio | n: Customized T |
| Commar | nd: Goto(to-pabx,\${XIVO_DS |
| CallerID mod | le : • |
| Preprocess subroutin | e: |
| Des | scription : |
| | |
| SAVE | |

Create the interconnections

You have to create two interconnections :

- provider side : dahdi/g0
- PBX side : dahdi/g2

In the menu Services \rightarrow IPBX \rightarrow Trunk management \rightarrow Customized page :

- Name : t2-operateur
- Interface : dahdi/g0
- Context : to-extern

The second interconnection :

- Name : t2-pabx
- Interface : dahdi/g2
- Context : to-pabx

Create outgoing calls

You must create two rules of outgoing calls in the menu $Services \rightarrow IPBX \rightarrow Call management \rightarrow Outgoing calls page :$

- 1. Redirect calls to the PBX :
- Name : fsc-pabx
- Context : to-pabx

| Customized trunk > Add | | | | |
|------------------------|------------------------------------|--|--|--|
| | Name: t2-operateur | | | |
| Inte Interface s | rface: dahdi/g0 | | | |
| | ntext: Appels sortants (to-extern) | | | |
| SAVE | | | | |

5.18.5 Create an interconnection

There are three types of interconnections :

- Customized
- SIP
- IAX

Customized interconnections

Customized interconnections are mainly used for interconnections using DAHDI or Local channels:

- Name : it is the name which will appear in the outcall interconnections list,
- *Interface* : this is the channel name (for DAHDI see *DAHDI interconnections*)
- Interface suffix (optional) : a suffix added after the dialed number (in fact the Dial command will dial:

<Interface>/<EXTEN><Interface suffix>

• Context : currently not relevant

SIP interconnections

- General, Signaling and Advanced tabs create the SIP peer information
- Register tab creates the registration chain

Note: in XiVO PBX Web interface slash "/" character is not supported in the password field.

DAHDI interconnections

To use your DAHDI links you must create a customized interconnection.

Name : the name of the interconnection like e1_span1 or bri_port1

Interface : must be of the form dahdi/[group order][group number] where :

- group order is one of :
 - g : pick the first available channel in group, searching from lowest to highest,
 - G : pick the first available channel in group, searching from highest to lowest,
 - r : pick the first available channel in group, going in round-robin fashion (and remembering where it last left off), searching from lowest to highest,
 - R : pick the first available channel in group, going in round-robin fashion (and remembering where it last left off), searching from highest to lowest.
- group number is the group number to which belongs the span as defined in the /etc/asterisk/dahdichannels.conf.

Warning: if you use a BRI card you MUST use per-port dahdi groups. You should not use a group like g0 which spans over several spans.

For example, add an interconnection to the menu Services \rightarrow IPBX \rightarrow Trunk management \rightarrow Customized

Name : interconnection name Interface : dahdi/g0

| Name: | t2 |
|------------------|-----------------------------|
| Interface: | dahdi/g0 |
| nterface suffix: | |
| Context: | Appels sortants (to-extern) |
| Descript | tion : |
| | |
| | |
| | |
| | |

5.18.6 Debug

Interesting Asterisk commands:

```
sip show peers
sip show registry
sip set debug on
```

5.18.7 Caller ID

When setting up an interconnection with the public network or another PBX, it is possible to set a caller ID in different places. Each way to configure a caller ID has it's own use case.

The format for a caller ID is the following "My Name" <99999> If you don't set the number part of the caller ID, the dialplan's number will be used instead. This might not be a good option in most cases. If you only need to set a *number* as an outgoing caller ID, you just have to put the number in the caller ID field like 0123456789.

5.18.8 Outgoing call caller ID

There are several behavior for the outgoing caller ID.

Use internal caller ID

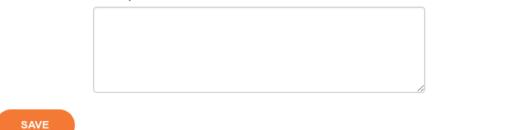

When you create an outgoing call, it's possible to set it to internal, using the check box in the outgoing call configuration menu. When this option is activated, the internal caller's caller ID will be forwarded to the trunk. This option is useful when the other side of the trunk can reach the user with it's caller ID number.

Outgoing calls > Add

| General | Exten | Call permissions | Schedu | es | | |
|----------|---------------------------|---------------------|-----------|-------------------------|-------------|----|
| | Name: | test_originate | | | | |
| | Context: | Appels sortants (to |)-extern) | T | | |
| | Use ENUM: | | | | | |

| | loopback (Local @default) | + |
| | t2-pabx (dahdi/g2) | + |
| | trunk-maq-xivo-demo (SIP) | + |
| | trunk-orange-1 (SIP) | + |
| | trunk-orange-2 (SIP) | + |

Description :

Outgoing calls > Add Exten General Call permissions Schedules Extern prefix Prefix Exten Stripnum Callerid Ŧ **‡**1 × 'XiVO' <555555555 99X. ۳ 2 SAVE

Use outgoing caller ID

When the internal caller's caller ID is not usable to the called party, the outgoing call's caller id can be fixed to a given value that is more useful to the outside world. Giving the public number here might be a good idea.

A user can also have a forced caller ID for outgoing calls. This can be useful for a user who has his own public number (DID number). This option can be set in the user's configuration page. For this, the *Outgoing Caller ID* option must be set to Customize.

The user can also set his outgoing caller ID to Anonymous.

If you use a SIP provider trunk, and if your provider supports the RFC3325 for Anonymous calls, you have to set the Send the Remote-Party-ID option of your SIP trunk to **PAI**:

- 1. Services \rightarrow Trunk management \rightarrow SIP Protocol \rightarrow Edit \rightarrow tab Advanced
- 2. set parameter Send the Remote-Party-ID to PAI

With this option anonymous calls will be sent to your SIP provider with the RFC 3325 standard. Note that in this case, the *P-Asserted-Identity* SIP Header will contain the Outgoing caller ID number if set. Otherwise it will use the user's internal caller id, which not a good idea. So you should configure a default caller ID in the outgoing call.

Order of precedence

The order of precedence when setting the caller ID in multiple places is the following.

- 1. Internal
- 2. User's outgoing caller ID
- 3. Outgoing call caller ID
- 4. Default caller ID

5.19 Interactive Voice Response

5.19.1 Introduction

Interactive voice response (IVR) is a technology that allows a computer to interact with humans through the use of voice and DTMF tones input via keypad. In telecommunications, IVR allows customers to interact with a company's host system via a telephone keypad or by speech recognition, after which they can service their own inquiries by following the IVR dialogue.

-Wikipedia

The IVR can be easily added to XiVO using scripts. These scripts are written using the asterisk embeded language also named dialplan .

5.19.2 Use Case: Minimal IVR

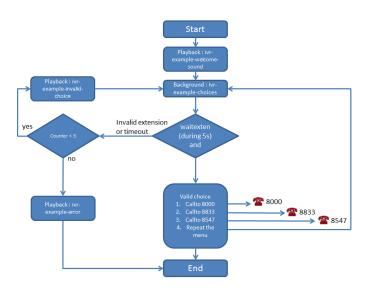

Flowchart

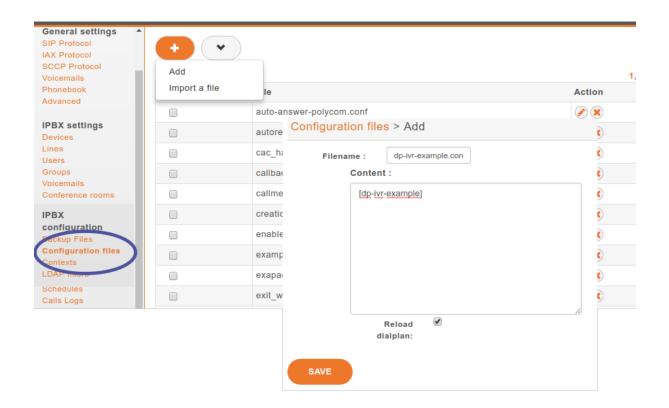

Configuration File and Dialplan

First step, you need to create a configuration file, that contain an asterisk context and your IVR dialpan. In our example, both (file and context) are named dp-ivr-example.

Copy all these lines in the newly created configuration file (in our case, dp-ivr-example) :

| Users > Ed | lit | | | | | | |
|---------------|-------------|------------|------------|-----------|--------|-----------|--|
| General | Lines | No answer | Services | Voicemail | Groups | Func Keys | |
| Fi | rst name: | User1 | | | | | |

| L | anguage: | fr FR | T | | | | |
| т | 'imezone: | | | • | | | |
| | Caller ID: | User1 | | | | | |
| Outgoing | Caller ID: | Customize | e v | | | | |
| | | "Bob" <555 | 55551234 | | | | |
| Preprocess su | ibroutine: | | | | | | |
| U | ser field : | | | | | | |
| ZiVO Cli | ent | | | | | | |
| Enable Xi | iVO Client: | | | | | | |
| | Login: | bob | | | | | |
| 1 | Password: | passss | | | | | |
| | Profile: | Client | • | | | | |
| | Descri | ption: | | | | | |
| | | | | | | | |
| SAVE | | | | | | | |

[dp-ivr-example] exten = s,1,NoOp(### dp-ivr-example.conf ###) same = n, NoOp (Set the context containing your ivr destinations.) same = n,Set(IVR_DESTINATION_CONTEXT=my-ivr-destination-context) same = n,NoOp(Set the directory containing your ivr sounds.) same = n,Set(GV_DIRECTORY_SOUNDS=/var/lib/xivo/sounds/ivr-sounds) same = n, NoOp(the system answers the call and waits for 1 second before continuing) same = n, Answer (1000) same = n,NoOp(the system plays the first part of the audio file "welcome to ...") same = n(first),Playback(\${GV_DIRECTORY_SOUNDS}/ivr-example-welcome-sound) same = n, NoOp(variable "counter" is set to 0) same = n(beginning), Set(counter=0) same = n,NoOp(variable "counter" is incremented and the label "start" is defined) same = n(start), Set(counter=\$[\${counter} + 1]) same = n,NoOp(counter variable is now = \${counter}) same = n, NoOp (waiting for 1 second before reading the message that indicate all. →choices) same = n, Wait(1)same = n, NoOp (play the message ivr-example-choices that contain all choices) same = n,Background(\${GV_DIRECTORY_SOUNDS}/ivr-example-choices) same = n, NoOp(waiting for DTMF during 5s) same = n,Waitexten(5) ;##### CHOICE 1 ##### exten = 1,1,NoOp(pressed digit is 1, redirect to 8000 in \${IVR_DESTINATION_CONTEXT} \rightarrow context) exten = 1, n, Goto (\${IVR_DESTINATION_CONTEXT}, 8000, 1) ;##### CHOICE 2 ##### exten = 2,1,NoOp(pressed digit is 2, redirect to 8833 in \${IVR_DESTINATION_CONTEXT} \leftrightarrow context) exten = 2, n, Goto (\${IVR_DESTINATION_CONTEXT}, 8833, 1) ;##### CHOICE 3 ##### exten = 3,1,NoOp(pressed digit is 3, redirect to 8547 in \${IVR_DESTINATION_CONTEXT} \hookrightarrow context) exten = 3, n, Goto (\${IVR_DESTINATION_CONTEXT}, 8547, 1) ;##### CHOICE 4 ##### exten = 4,1,NoOp(pressed digit is 4, redirect to start label in this context) exten = 4, n, Goto (s, start) ;##### TIMEOUT ##### exten = t,1,NoOp(no digit pressed for 5s, process it like an error) exten = t, n, Goto(i, 1);##### INVALID CHOICE ##### exten = i,1,NoOp(if counter variable is 3 or more, then goto label "error") exten = i,n,GotoIf(\$[\${counter}>=3]?error) exten = i,n,NoOp(pressed digit is invalid and less than 3 errors: the guide ivr-→exemple-invalid-choice is now played) exten = i,n,Playback(\${GV_DIRECTORY_SOUNDS}/ivr-example-invalid-choice) exten = i,n,Goto(s,start) exten = i,n(error),Playback(\${GV_DIRECTORY_SOUNDS}/ivr-example-error) exten = i,n,Hangup()

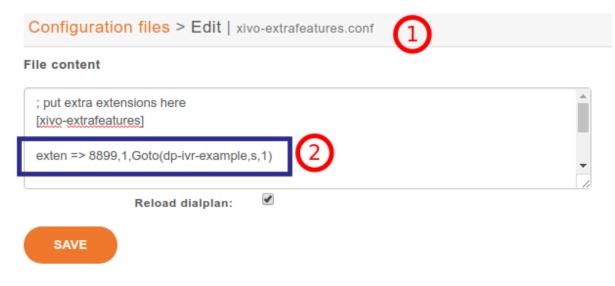

IVR external dial

To call the script dp-ivr-example from an external phone, you must create an incoming call and redirect the call to the script dp-ivr-example with the command :

| Goto(dp-ivr-example, | s,1) |
|--|--|
| ІРВХ | |
| ІРВХ | (+) |
| General settings | |
| SIP Protocol | Incoming calls > Edit 0972521691 (from-extern) |
| IAX Protocol | |
| SCCP Protocol | |
| Voicemails | General Call permissions Schedules |
| Phonebook | |
| Advanced | DID: 0972521691 |
| IPBX settings | Context: Incalls (from-extern) |
| Devices | Context: Incails (Iron-extern) |
| Lines | Destination : Customized |
| Users | |
| Groups | Command: Goto(dp-ivr-example,s,1) |
| Voicemails | CallerID mode : |
| Conference rooms | |
| | Preprocess subroutine : user_data_test |
| Call management | Description : |
| Incoming calls | |
| Outgoing cells Call permit Incoming calls | |
| | |
| Call filters | |
| Call pickups Schedules | |
| | |
| Calls Logs | |
| Trunk management | |
| SIP Protocol | SAVE |
| SIP Provider | |
| | 1 |

IVR internal dial

To call the script dp-ivr-example from an internal phone you must create an entry in the default context (xivo-extrafeatures is included in default). The best way is to add the extension in the file xivo-extrafeatures.conf.

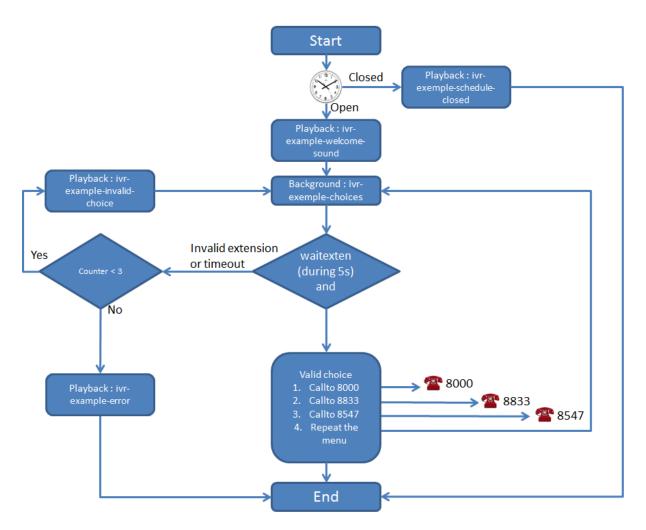

exten => 8899,1,Goto(dp-ivr-example,s,1)

5.19.3 Use Case: IVR with a schedule

In many cases, you need to associate your IVR to a schedule to indicate when your company is closed.

Flowchart

Create Schedule

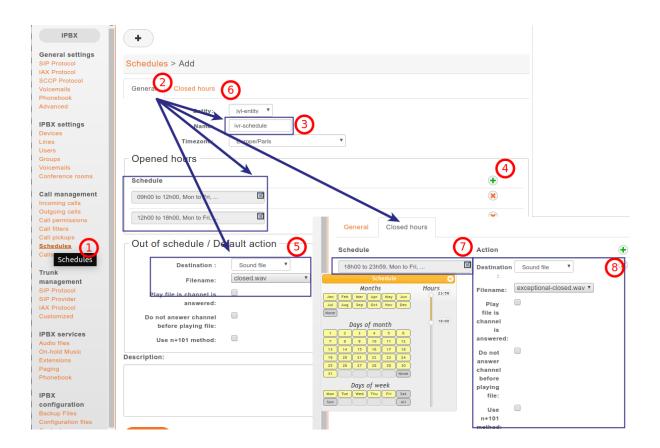

First step, create your schedule (1) from the menu *Call management* \rightarrow *Schedules*. In the General tab, give a name (3) to your schedule and configure the open hours (4) and select the sound which is played when the company is closed.

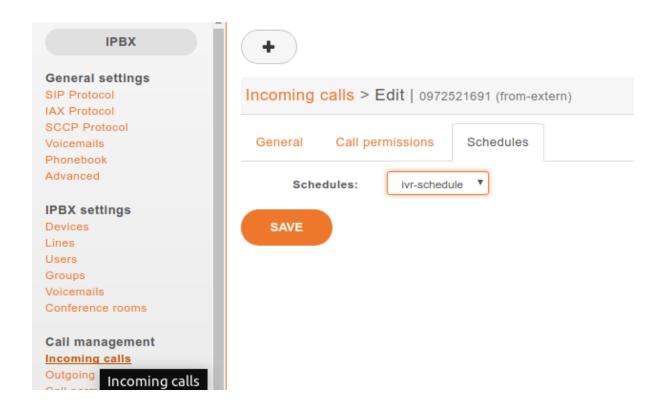

In the Closed hours tab (6), configure all special closed days (7) and select the sound that indicate to the caller that the company is exceptionally closed.

The IVR script is now only available during workdays.

Assign Schedule to Incall

Return editing your Incall (*Call management* \rightarrow *Incoming calls*) and assign the newly created schedule in the "Schedules" tab

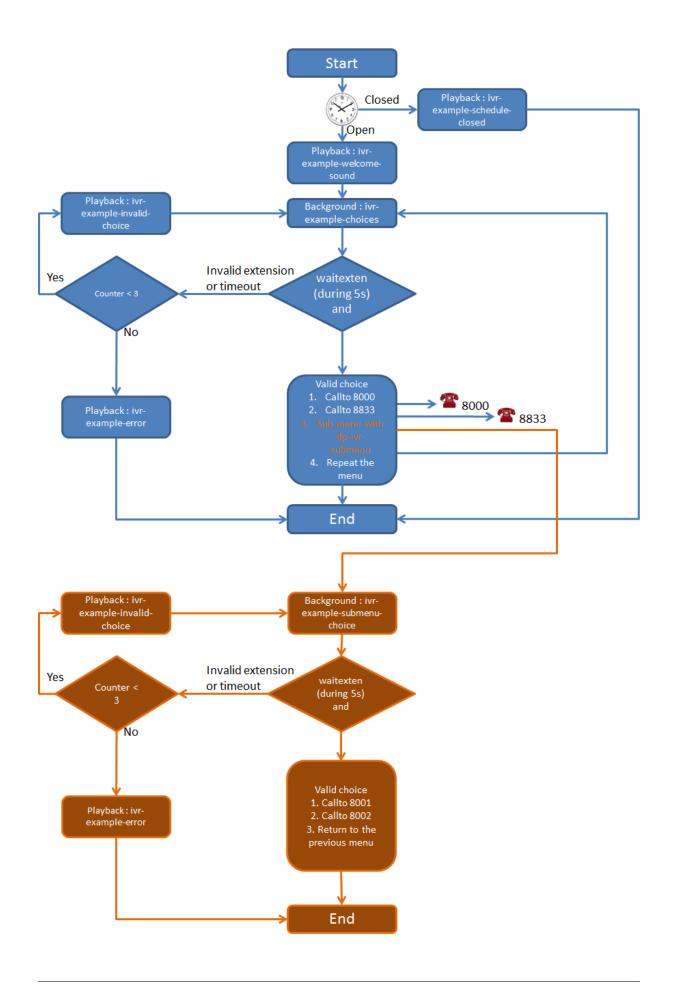

5.19.4 Use Case: IVR with submenu

Flowchart

Configuration File and Dialplan

Copy all these lines (2 contexts) in a configuration file on your XiVO server :

```
[dp-ivr-example]
exten = s,1,NoOp(### dp-ivr-example.conf ###)
same = n,NoOp(Set the context containing your ivr destinations.)
same = n,Set(IVR_DESTINATION_CONTEXT=my-ivr-destination-context)
same = n,NoOp(Set the directory containing your ivr sounds.)
same = n,Set(GV_DIRECTORY_SOUNDS=/var/lib/xivo/sounds/ivr-sounds)

exten = i,n,Goto(s,start)
exten = i,n(error),Playback(${GV_DIRECTORY_SOUNDS}/ivr-example-error)
exten = i, n, Hangup()
```

5.20 Monitoring

The Monitoring section gives an overview of a XiVO system's status and of all monitored processes. It is divided into 6 sections :

- System
- Device
- *CPU*
- Network
- Memory
- Other Services

5.20.1 System

Displays generic information about the operating system, network addresses, uptime and load average. Read only.

5.20.2 Device

Displays free/used space on physical storage partitions. Read only.

5.20.3 CPU

Monitors the CPU usage. Read only.

5.20.4 Network

Displays network interfaces and corresponding network traffic. Read only.

5.20.5 Memory

Displays Physical and swap memory usage. Read only.

5.20.6 Other Services

Lists XiVO related processes (most of which are daemons) with their corresponding status, uptime, resource usage and controls to restart service, stop service and stop monitoring service.

5.21 Music on Hold

The menu Services \rightarrow IPBX \rightarrow IPBX services \rightarrow On-hold Music leads to the list of available on-hold musics.

| G.723 | .g723 .g723sf |
| G.726 | .g726-40 .g726-32 .g726-24 .g726-16 |
| G.729 | .g729 |
| GSM | .gsm |
| iLBC | .ilbc |
| Ogg Vorbis | .ogg (only mono files sampled at 8000 Hz) |
| G.711 A-law | .alaw .al .alw |
| G.711 µ-law | .pcm .ulaw .ul .mu .ulw |
| G.722 | .g722 |
| Au | .au |
| Siren7 | .siren7 |
| Siren14 | .siren14 |
| SLN | .raw .sln .sln12 .sln16 .sln24 .sln32 .sln44 .sln48 .sln96 .sln192 |
| VOX | .vox |
| WAV | .wav .wav16 |
| WAV GSM | .WAV .wav49 |

Only 1 audio channel must be present per file, i.e. files must be in mono.

If your music on hold files don't seem to work, you should look for errors in the asterisk logs.

The on-hold music will always play from the start.

• mp3: play MP3 files.

The on-hold music will play from an arbitrary position on the track, it will not play from the start.

• custom: do not play sound files. Instead, run an external process. That process must send on stdout the same binary format than WAV files.

```
Example process: /usr/bin/mpg123 -s --mono -y -f 8192 -r 8000 http://
streaming.example.com/stream.mp3
```

Note: Processes run by custom categories are started as soon as the category is created and will only stop when the category is deleted. This means that on-hold music fed from online streaming will constantly be receiving network traffic, even when there are no calls.

5.22 Paging

With XiVO, you can define paging (i.e. intercom) extensions to page a group of users. When calling a paging extension, the phones of the specified users will auto-answer, if they support it.

You can manage your paging extensions via the Services \rightarrow IPBX \rightarrow Paging page.

When adding a new paging extension, the number can be any numeric value; to call it, you just need to prefix the paging number with *11.

| Paging > Edit | |
|---|--------|
| General Users | |
| Number: | 601 |
| Full duplex audio: | |
| Ignore attempts to forward the call: | |
| Record the page into a file: | |
| Quiet, do not play beep to caller: | |
| Timeout: | 30 🔻 🚱 |
| Do not play simultaneous announcement to caller: | |
| Play simultaneous announcement to called users: | |
| The announcement to playback in all devices: | Ψ |
| Descripti | on: |
| | |
| SAVE | |

5.23 Parking

With XiVO it is possible to park calls, the same way you may park your car in a car parking. If you define supervised keys on a phone set for all the users of a system, when a call is parked, all the users are able to see that some one is waiting for an answer, push the phone key and get the call back to the phone.

There is a default parking number, 700, which is already configured when you install XiVO, but you may change the default configuration by editing the parking extension in menu Service \rightarrow IPBX \rightarrow IPBX Services \rightarrow Extensions \rightarrow Parking

Using this extension, you may define the parking number used to park call, the parking lots, wether the sytem is rotating over the parking lots to park the calls, enable parking hint if you want to be able to supervise the parking using phone keys and other system default parameters.

You have two options in case of parking timeout :

• Callback the peer that parked this call

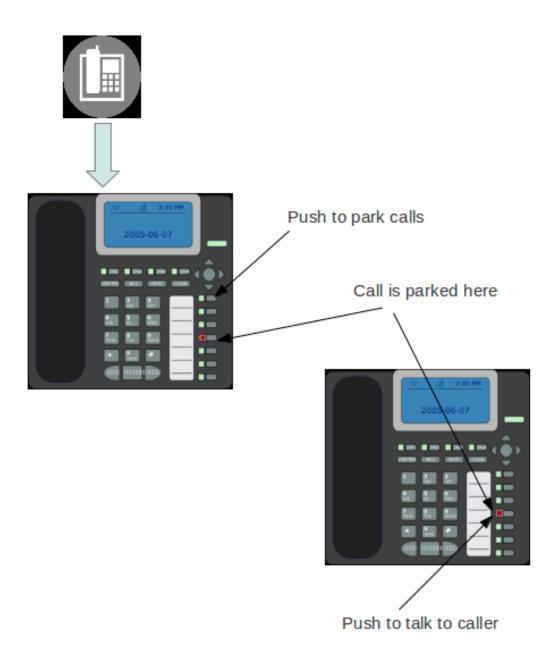

In this case the call is sent back to the user who parked the call.

• Send park call to the dialplan

In case you don't want to call back the user who parked the call, you have the option to send the call to any other extension or application. If the parking times out, the call is sent back to the dialplan in context [parkedcallstimeout]. You can define this context in a dialplan configuration file Service \rightarrow *IPBX* \rightarrow *Configuration Files* where you may define this context with dialplan commands.

Example:

```
[parkedcallstimeout]
exten = s,1,Noop('park call time out')
```

| xtensions con | | | | | | | | |
|-----------------------------------|------------------------------|-----------------|---------------------|--------|---------|--------|----------|--|
| General Calls | s Transfers | Forwards | Voicemail | Agent | Parking | Paging | Advanced | |
| | Extension: | 900 | | | | | | |
| | Context: | parkedcalls | | | | | | |
| | Wait delay: | 45 seconds | Ŧ | | | | | |
| Extension to | o park calls: | 901-850 | | | | | | |
| Method for selec | ting parking spaces: | Next 🔻 | | | | | | |
| Par | | | | | | | | |
| Allow dynamic | ally created parkinglots: | | | | | | | |
| On parked | call timeout: | Callback the pe | er that parked this | call 🔻 | | | | |
| ho to play courtes picking up | y tone when parked call: | Caller • | | | | | | |
| Allow DTMF bas when picking up | | None 🔻 | | | | | | |
| Allow DTMF ba when picking up | | None T | | | | | | |
| Allow DTMF bas when picking up | | None 🔻 | | | | | | |
| Allow DTMF base recording when | | None V | | | | | | |
| MOH class to pla | ay to parked calls: | default V | | | | | | |

```
same = n,Playback(hello-world)
same = n,Hangup()
```

It is also usual to define supervised phone keys to be able to park and unpark calls as in the example below.

| General | Lines No answer Services | Voicemail | Groups Func Keys | | | |
|---------|--------------------------|-----------|------------------|---------|-------------------|----|
| Key | Туре | | Destination | Label | Supervision | (|
| 1 * | User | • | Linda | Linda | Enabled V | ٢ |
| 2 🔻 | Parking | v | 900 | Parking | Disabled V | ٢ |
| 3 🔻 | Parking position | v | 901 | 701 | Enabled v | ٥ |
| 4 ▼ | Parking position | T | 902 | 702 | Enabled T | () |
| 5 🔻 | Parking position | • | 903 | 703 | Enabled • | () |
| 6 ▼ | Parking position | • | 904 | 704 | Enabled • | () |

5.24 Phonebook

A global phone book can be defined in $Services \rightarrow IPBX \rightarrow IPBX$ $Services \rightarrow Phonebook$. The phone book can be used from the XiVO Client, from the phones directory look key if the phone is compatible and are used to set the Caller ID for incoming calls.

You can add entries one by one or you can mass-import from a CSV file.

Note: To configure phonebook, see Directories.

5.24.1 Mass-import contacts

Go in the Services \rightarrow IPBX \rightarrow IPBX Services \rightarrow Phonebook section and move your mouse cursor on the + button in the upper right corner. Select Import a file.

The file to be imported must be a CSV file, with a pipe character | as field delimiter. The file must be encoded in UTF-8 (without an initial BOM).

Mandatory headers are :

- title (possible values : "mr", "mrs", "ms")
- displayname

Optional headers are :

- firstname
- lastname
- society

- mobilenumber¹
- email
- url
- description
- officenumber¹
- faxnumber¹
- officeaddress1
- officeaddress2
- officecity
- officestate
- officezipcode
- officecountry²
- homenumber¹
- homeaddress1
- homeaddress2
- homecity
- homestate
- homezipcode
- homecountry²
- othernumber¹
- otheraddress1
- otheraddress2
- othercity
- otherstate
- otherzipcode
- othercountry²

5.25 Provisioning

XiVO supports the auto-provisioning of a large number of telephony *Devices*, including SIP phones, SIP ATAs, and even softphones.

5.25.1 Introduction

The auto-provisioning feature found in XiVO make it possible to provision, i.e. configure, a lots of telephony devices in an efficient and effortless way.

¹ These fields must contain only numeric characters, no space, point, etc.

 $^{^{2}}$ These fields must contain ISO country codes. The complete list is described here.

How it works

Here's a simplified view of how auto-provisioning is supported on a typical SIP hardphone:

- 1. The phone is powered on
- 2. During its boot process, the phone sends a DHCP request to obtain its network configuration
- 3. A DHCP server replies with the phone network configuration + an HTTP URL
- 4. The phone use the provided URL to retrieve a common configuration file, a MAC-specific configuration file, a firmware image and some language files.

Building on this, configuring one of the supported phone on XiVO is as simple as:

- 1. Configuring the DHCP Server
- 2. Installing the required provd plugin
- 3. Powering on the phone
- 4. Dialing the user's provisioning code from the phone

And *voila*, once the phone has rebooted, your user is ready to make and receive calls. No manual editing of configuration files nor fiddling in the phone's web interface.

Limitations

• Device synchronisation does not work in the situation where multiple devices are connected from behind a NAPT network equipment. The devices must be resynchronised manually.

External links

- Introduction to provd plugin model
- HTTP/TFTP requests processing in provd part 1
- HTTP/TFTP requests processing in provd part 2

5.25.2 Basic Configuration

You have two options to get your phone to be provisioned:

- Set up a DHCP server
- Tell manually each phone where to get the provisioning informations

You may want to manually configure the phones if you are only trying XiVO or if your network configuration does not allow the phones to access the XiVO DHCP server.

You may want to set up a DHCP server if you have a significant number of phones to connect, as no manual intervention will be required on each phone.

Configuring the DHCP Server

XiVO includes a DHCP server that facilitate the auto-provisioning of telephony devices. It is *not* activated by default.

There's a few things to know about the peculiarities of the included DHCP server:

- it only answers to DHCP requests from supported devices.
- it only answers to DHCP requests coming from the VoIP subnet (see network configuration).

This means that if your phones are on the same broadcast domain than your computers, and you would like the DHCP server on your XiVO to handle both your phones and your computers, that won't do it.

The DHCP server is configured via the *Configuration* \rightarrow *Network* \rightarrow *DHCP* page:

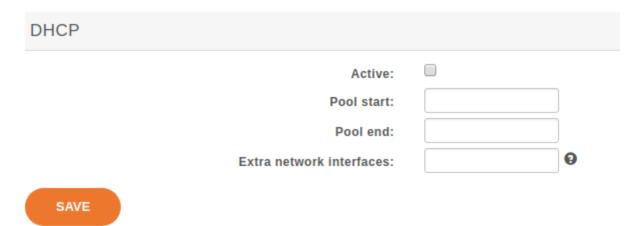

Fig. 5.33: Configuration \rightarrow Network \rightarrow DHCP

- Active Activate/desactivate the DHCP server.
- **Pool start** The lower IP address which will be assigned dynamically. This address should be in the VoIP subnet. Example: 10.0.0.10.
- **Pool end** The higher IP address which will be assigned dynamically. This address should be in the VoIP subnet. Example: 10.0.0.99.

Extra network interfaces A list of space-separated network interface name. Example: eth0.

Useful if you have done some custom configuration in the /etc/dhcp/dhcpd_extra.conf file. You need to explicitly specify the additional interfaces the DHCP server should listen on.

After saving your modifications, you need to click on Apply system configuration for them to be applied.

Installing provd Plugins

The installation and management of provd plugins is done via the Configuration \rightarrow Provisioning \rightarrow Plugin page.

The page shows the list of both the installed and installable plugins. You can see if a plugin is installed or not by looking at the *Action* column.

Here's the list of other things that can be done from this page:

- update the list of installable plugins, by clicking on the top left icon (1). On a fresh XiVO installation, this is the first thing to do.
- install a new plugin (2)
- edit an installed plugin (3), i.e. install/uninstall optional files that are specific to each plugin, like firmware or language files
- upgrade an installed plugin (4)
- uninstall an installed plugin (5)

After installing a new plugin, you are automatically redirected to its edit page. You can then download and install optional files specific to the plugin. You are strongly advised to install firmware and language files for the phones you'll use although it's often not a strict requirement for the phones to work correctly.

Fig. 5.34: Configuration \rightarrow Provisioning \rightarrow Plugin

Warning: If you uninstall a plugin that is used by some of your devices, they will be left in an unconfigured state and won't be associated to another plugin automatically.

The search box at the top comes in handy when you want to find which plugin to install for your device. For example, if you have a Cisco SPA508G, enter "508" in the search box and you should see there's 1 plugin compatible with it.

Note: If your device has a number in its model name, you should use only the number as the search keyword since this is what usually gives the best results.

It's possible there will be more than 1 plugin compatible with a given device. In these cases, the difference between the two plugins is usually just the firmware version the plugins target. If you are unsure about which version you should install, you should look for more information on the vendor website.

It's good practice to only install the plugins you need and no more.

Alternative plugins repository

By default, the list of plugins available for installation are the stable plugins for the officially supported devices.

This can be changed in the *Configuration* \rightarrow *Provisioning* \rightarrow *General* page, by setting the *URL* field to one of the following value:

- http://provd.xivo.solutions/plugins/1/stable/ officially supported devices "stable" repository (default)
- http://provd.xivo.solutions/plugins/1/testing/ officially supported devices "testing" repository
- http://provd.xivo.solutions/plugins/1/archive/ officially supported devices "archive" repository
- http://provd.xivo.solutions/plugins/1/addons/stable/ community supported devices "stable" repository
- http://provd.xivo.solutions/plugins/1/addons/testing/ community supported devices "testing" repository

The difference between the stable and testing repositories is that the latter might contain plugins that are not working properly or are still in development.

The archive repository contains plugins that were once in the stable repository.

After setting a new URL, you must refresh the list of installable plugins by clicking the update icon of the *Configuration* \rightarrow *Provisioning* \rightarrow *Plugin* page.

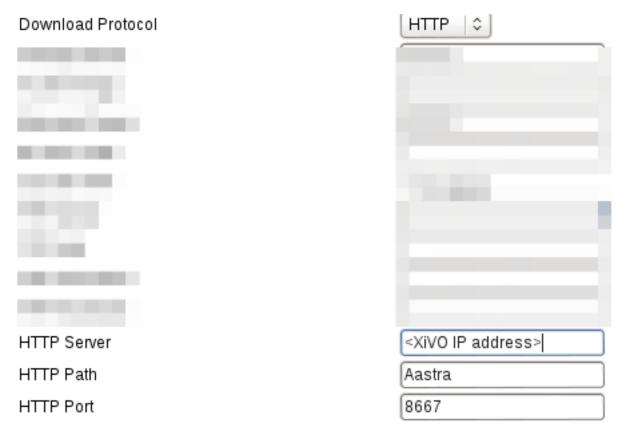

How to manually tell the phones to get their configuration

If you have set up a DHCP server on XiVO and the phones can access it, you can skip this section.

The according provisioning plugins must be installed.

Aastra

On the web interface of your phone, go to Advanced settings \rightarrow Configuration server, and enter the following settings:

Polycom

On the phone, go to $Menu \rightarrow Settings \rightarrow Advanced \rightarrow Admin Settings \rightarrow Network configuration \rightarrow Server Menu and enter the following settings:$

- Server type: HTTP
- Server address: http://<XiVO IP address>:8667/0000000000.cfg

Then save and reboot the phone.

Snom

On the web interface of your phone, go to *Setup* \rightarrow *Advanced* \rightarrow *Update* and enter the following settings:

| Network Behavior Audio SIP/RTP | OoS/Security Update |
|--------------------------------|---|
| Update: | |
| Update Policy: | Update automatically 🗘 🕐 |
| Setting URL: | http:// <xivo address="" ip="">:8667</xivo> |
| Settings refresh timer: | 0 |
| PnP Config: | Oon ⊚off ? |
| t market | Deal Dates |
| Apply | Reset Reboot |

Yealink

On the web interface of your phone, go to *Settings* \rightarrow *Auto Provision*, and enter the following settings:

• Server URL: http://<XiVO IP address>:8667

| Yealink T46G | Status Account Networ | k DSSKey Features Settings |
|----------------|------------------------|---|
| Preference | Auto Provision | |
| Time & Date | PNP Active | ⊙ on ○ off 🕜 |
| | DHCP Active | ⊙ on ⊖ off 🕜 |
| Upgrade | Custom Option(128~254) | |
| Auto Provision | DHCP Option Value | yealink 🕜 |
| Configuration | Server URL | http:// <xivo address="" ip="">:8667</xivo> |

Save the changes by clicking on the Confirm button and then click on the Autoprovision Now button.

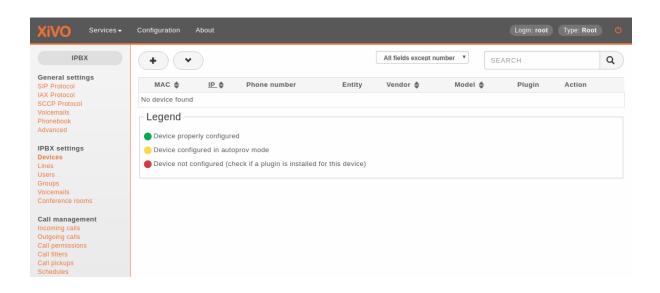

Autoprovisioning a Device

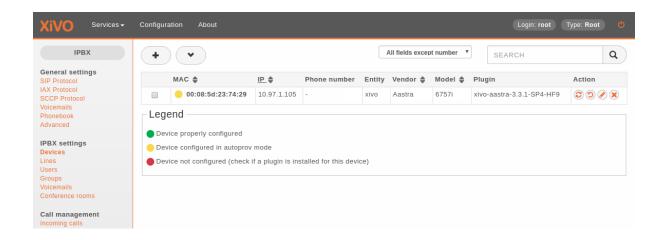

Once you have installed the proper provd plugins for your devices and setup correctly your DHCP server, you can then connect your devices to your network.

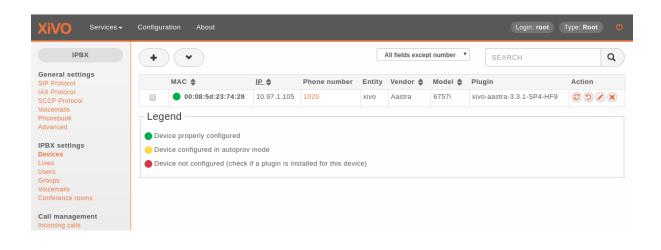

But first, go to Services \rightarrow IPBX \rightarrow Devices page. You will then see that no devices are currently known by your XiVO:

You can then power on your devices on your LAN. For example, after you power on an Aastra 6757i and give it the time to boot and maybe upgrade its firmware, you should then see the phone having its first line configured as 'autoprov', and if you refresh the devices page, you should see that your XiVO now knows about your 6757i:

You can then dial from your Aastra 6757i the provisioning code associated to a line of one of your user. You will hear a prompt thanking you and your device should then reboot in the next few seconds. Once the device has rebooted, it will then be properly configured for your user to use it. And also, if you update the device page, you'll see that the icon next to your device has now passed to green:

Resetting a Device

From the Device List in the Webi

To remove a phone from XiVO or enable a device to be used for another user there are two different possibilities :

• click on the reset to autoprov button on the web interface

| Vendor 🌲 | Model 🌲 | Plugin | Action |
|----------|---------|-----------------------|---------|
| Yealink | T48G | xivo-yealink-v81 | 2 9 2 X |
| Snom | 720 | xivo-snom-8.9.3.60 | 60) × |
| Aastra | 6755i | xivo-aastra-3.3.1-SP2 | 2 9 e x |

The phone will restarts and display autoprov, ready to be used for another user.

From the User Form in the Webi

Device With one User Only Associated

Edit the user associated to the device and put the device field to null.

• click on the Save button on the web interface

The phone doesn't restart and the phone is in autoprov mode in the device list.

You can synchronize the device to reboot it.

Device with Several Users Associated

Edit the primary user associated to the terminal (one with the line 1) and put the device field to null.

• click on the Save button on the web interface

The primary line of the phone has been removed, so the device will lose its funckeys associated to primary user but there others lines associated to the device will stay provisionned.

The phone doesn't restart and the phone is in autoprov mode in the device list.

You can synchronize the device for reboot it.

From a Device

• Dial *guest (*48378) on the phone dialpad followed by xivo (9486) as a password

The phone restarts and display autoprov, ready to be used for another user.

5.25.3 Advanced Configuration

DHCP Integration

If your phones are getting their network configuration from your XiVO's DHCP server, it's possible to activate the DHCP integration on the *Configuration* \rightarrow *Provisioning* \rightarrow *General* page.

What DHCP integration does is that, on every DHCP request made by one of your phones, the DHCP server sends information about the request to provd, which can then use this information to update its device database.

This feature is useful for phones which lack information in their TFTP/HTTP requests. For example, without DHCP integration, it's impossible to extract model information for phones from the Cisco 7900 series. Without the model information extracted, there's chance your device won't be automatically associated to the best plugin.

This feature can also be useful if your phones are not always getting the same IP addresses, for one reason or another. Again, this is useful only for some phones, like the Cisco 7900; it has no effect for Aastra 6700.

Creating Custom Templates

Custom templates comes in handy when you have some really specific configuration to make on your telephony devices.

Templates are handled on a per plugin basis. It's not possible for a template to be shared by more than one plugin since it's a design limitation of the plugin system of provd.

Note: When you install a new plugin, templates are not migrated automatically, so you must manually copy them from the old plugin directory to the new one. This does not apply for a plugin upgrade.

Let's suppose we have installed the xivo-aastra-3.3.1-SP2 plugin and want to write some custom templates for it.

First thing to do is to go into the directory where the plugin is installed:

cd /var/lib/xivo-provd/plugins/xivo-aastra-3.3.1-SP2

Once you are there, you can see there's quite a few files and directories:

```
tree
+-- common.py
+-- entry.py
+-- pkgs
   +-- pkgs.db
+-- plugin-info
+-- README
+-- templates
   +-- 6730i.tpl
   +-- 6731i.tpl
    +-- 6739i.tpl
   +-- 6753i.tpl
   +-- 6755i.tpl
   +-- 6757i.tpl
    +-- 9143i.tpl
   +-- 9480i.tpl
    +-- base.tpl
  - var
    +-- cache
    +-- installed
    +-- templates
    +-- tftpboot
```

+-- Aastra +-- aastra.cfg

The interesting directories are:

templates This is where the original templates lies. You *should not* edit these files directly but instead copy the one you want to modify in the var/templates directory.

var/templates This is the directory where you put and edit your custom templates.

var/tftpboot This is where the configuration files lies once they have been generated from the templates. You should look at them to confirm that your custom templates are giving you the result you are expecting.

Warning: When you uninstall a plugin, the plugin directory is removed altogether, including all the custom templates.

A few things to know before writing your first custom template:

- templates use the Jinja2 template engine.
- when doing an include or an extend from a template, the file is first looked up in the var/templates directory and then in the templates directory.
- device in autoprov mode are affected by templates, because from the point of view of provd, there's no difference between a device in autoprov mode or fully configured. This means there's usually no need to modify static files in var/tftpboot. And this is a bad idea since a plugin upgrade will override these files.

Custom template for every devices

```
cp templates/base.tpl var/templates
vi var/templates/base.tpl
xivo-provd-cli -c 'devices.using_plugin("xivo-aastra-3.3.1-SP2").reconfigure()'
```

Once this is done, if you want to synchronize all the affected devices, use the following command:

xivo-provd-cli -c 'devices.using_plugin("xivo-aastra-3.3.1-SP2").synchronize()'

Custom template for a specific model

Let's supose we want to customize the template for our 6739i:

```
cp templates/6739i.tpl var/templates
vi var/templates/6739i.tpl
xivo-provd-cli -c 'devices.using_plugin("xivo-aastra-3.3.1-SP2").reconfigure()'
```

Custom template for a specific device

To create a custom template for a specific device you have to create a device-specific template named <device_specific_file_with_extension>.tpl in the var/templates/ directory :

- for an Aastra phone, if you want to customize the file 00085D2EECFB.cfg you will have to create a template file named 00085D2EECFB.cfg.tpl,
- for a Snom phone, if you want to customize the file 000413470411.xml you will have to create a template file named 000413470411.xml.tpl,

- for a Polycom phone, if you want to customize the file 0004f2211c8b-user.cfg you will have to create a template file named 0004f2211c8b-user.cfg.tpl,
- and so on.

Here, we want to customize the content of a device-specific file named 00085D2EECFB.cfg, we need to create a template named 00085D2EECFB.cfg.tpl:

```
cp templates/6739i.tpl var/templates/00085D2EECFB.cfg.tpl
vi var/templates/00085D2EECFB.cfg.tpl
xivo-provd-cli -c 'devices.using_mac("00085D2EECFB").reconfigure()'
```

Note: The choice to use this syntax comes from the fact that provd supports devices that do not have MAC addresses, namely softphones.

Also, some devices have more than one file (like Snom), so this way make it possible to customize more than 1 file.

The template to use as the base for a device specific template will vary depending on the need. Typically, the model template will be a good choice, but it might not always be the case.

Changing the Plugin Used by a Device

From time to time, new firmwares are released by the devices manufacturer. This sometimes translate to a new plugin being available for these devices.

When this happens, it almost always means the new plugin obsoletes the older one. The older plugin is then considered "end-of-life", and won't receive any new updates nor be available for new installation.

Let's suppose we have the old xivo-aastra-3.2.2.1136 plugin installed on our xivo and want to use the newer xivo-aastra-3.3.1-SP2 plugin.

Both these plugins can be installed at the same time, and you can manually change the plugin used by a phone by editing it via the *Services* \rightarrow *IPBX* \rightarrow *Devices* page.

If you are using custom templates in your old plugin, you should copy them to the new plugin and make sure that they are still compatible.

Once you take the decision to migrate all your phones to the new plugin, you can use the following command:

Or, if you also want to synchronize (i.e. reboot) them at the same time:

You can check that all went well by looking at the Services \rightarrow *IPBX* \rightarrow *Devices* page.

NAT

The provisioning server has partial support for environment where the telephony devices are behind a NAT equipment.

By default, each time the provisioning server receives an HTTP/TFTP request from a device, it makes sure that only one device has the source IP address of the request. This is not a desirable behaviour when the provisioning server is used in a NAT environment, since in this case, it's normal that more than 1 devices have the same source IP address (from the point of view of the server).

If *all* your devices used on your XiVO are behind a NAT, you should disable this behaviour by setting the NAT option to 1 via the *Configuration* \rightarrow *Provisioning* \rightarrow *General* page.

Enabling the NAT option will also improve the performance of the provisioning server in this scenario.

If you have many devices behind a NAT equipment, you should also check the *security* section to make sure the IP address of your NAT equipment doesn't get banned unintentionally.

Limitations

- You must only have phones of the following brands:
 - Aastra
 - Cisco SPA
 - Yealink
- All your devices must be behind a NAT equipment (the devices may be grouped behind different NAT equipments, not necessarily the same one)
- You must provision the devices via the Web interface, i.e. associate the devices from the user form. Using the 6-digit provisioning code on the phone will produce unexpected results (i.e. the wrong device will be provisioned)

Security

By design, the auto-provisioning process is vulnerable to:

- Leakage of sensitive information: some files that are served by the provisioning server contains sensitive information, e.g. SIP credentials that are used by SIP phones to make calls. Depending on your network configuration and the amount of information an attacker has on your telephony ecosystem (phone vendor, MAC address, etc.), he could retrieve the content of some files containing sensitive information.
- Denial-of-service attack: in its default configuration, each time the provisioning server identify a request coming from a new device, it creates a new device object in its database. An attacker could spoof requests to the provisioning server to create a huge amount of devices, creating a denial-of-service condition.

That said, starting from XiVO 16.08, XiVO adds Fail2ban support to the provisioning server to drastically lower the likelihood of such attacks. Every time a request for a file potentially containing sensitive information is requested, a log line is appended to the /var/log/xivo-provd-fail2ban.log file, which is monitored by fail2ban. The same thing happens when a new device is automatically created by the provisioning server.

The fail2ban configuration for the provisioning server is located at /etc/fail2ban/jail.d/xivo.conf. You may want to adjust the findtime / maxretry value if you have special requirements. In particular, if you have many phones behind a NAT equipment, you'll probably have to adjust these values, since every request coming from your phones behind your NAT will appear to the provisioning server as coming from the same source IP address, and this IP address will then be more likely to get banned promptly if you, for example, reboot all your phones at the same time. Another solution would be to add your IP address to the list of ignored IP address of fail2ban. See the fail2ban(1) man page for more information.

System Requirements

XiVO 16.08 or later is required. You also need to use compatible xivo-provd plugins. Here's the list of official plugins which are compatible:

| Plugin family | Version |
|-----------------|---------|
| xivo-aastra | >= 1.6 |
| xivo-cisco-sccp | >= 1.1 |
| xivo-cisco-spa | >= 1.0 |
| xivo-digium | >= 1.0 |
| xivo-polycom | >= 1.7 |
| xivo-snom | >= 1.6 |
| xivo-yealink | >= 1.26 |

5.25.4 Remote directory

If you have a phone provisioned with XiVO and its one of the supported ones, you'll be able to search in your XiVO directory and place call directly from your phone.

See the list of *supported devices* to know if a model supports the XiVO directory or not.

Configuration

For the remote directory to work on your phones, the first thing to do is to go to the Services \rightarrow IPBX \rightarrow (General settings) Phonebook page.

You then have to add the range of IP addresses that will be allowed to access the directory. So if you know that your phone's IP addresses are all in the 192.168.1.0/24 subnet, just click on the small "+" icon and enter "192.168.1.0/24", then save.

Once this is done, on your phone, just click on the "remote directory" function key and you'll be able to do a search in the XiVO directory from it.

5.25.5 Jitsi

Jitsi (http://jitsi.org/) is an opensource softphone (previously SIP Communicator).

XiVO now support Jitsi sofphones provisioning. Here are the steps to follow :

Requirements

This how to needs :

- 1. Jitsi installed,
- 2. SIP line created

Add Jitsi plugin on XiVO

Open XiVO Web interface, and go to Configuration tab, Then chose *Provisioning* \rightarrow *Plugins menu*, Install the Jitsi plugin you want to use : e.g.:

xivo-jitsi-1

You can now launch your Jitsi softphone

Configuring Jitsi

- 1. Launch Jitsi,
- 2. If you don't have any accounts configured Jitsi will launch a windows and you can click
- 3. Use online provisioning. Otherwise go to Tools -> Options -> Advanced -> Provisioning, Click on Enable provisioning
- 4. Select Manually specify a provisioning URI,
- 5. Enter the folowing URI where <provd_ip> is the VoIP interface IP address of your XiVO and <provd_port> is the provd port (default : 8667)

http://<provd_ip>:<provd_port>/jitsi?uuid=\${uuid}

- 6. When done, quit Jitsi,
- 7. Launch Jitsi again,
- You should now be connected with in autoprov mode,
- You could see a new device in the devices list,
- 8. You can now provision the phones by typing the provisioning code (you get it in the Lines list),
- 9. Quit Jitsi again (configuration syncing is not available with the Jitsi plugin)
- 10. And launch Jitsi again : you should now be connected with you phone account

5.26 SCCP Configuration

5.26.1 Provisioning

To be able to provision SCCP phones you should :

- activate the *DHCP Server*,
- activate the DHCP Integration,

Then install a plugin for SCCP Phone: Configuration \rightarrow Provisioning \rightarrow Plugins

| Name | Description | Version | Size | Action |
|---------------------------|--|---------|--------------|-----------------------|
| null | Plugin that offers no configuration service and rejects TFTP/HTTP | 1.0 | 955.00 bytes | + |
| xivo-aastra-3.3.1-SP2 | Plugin for Aastra 6730i, 6731i, 6735i, 6737i, 6739i, 6753i, 6755i | 0.5.9 | - | 0 |
| xivo-aastra-3.3.1-SP4-HF9 | Plugin for Aastra/Mitel 67XXi in version 3.3.1 SP4 HF9. | 1.8 | 8.25 KiB | 0 |
| xivo-aastra-4.3.0 | Plugin for Aastra/Mitel 6863i, 6865i, 6867i and 6869i in version | 1.8 | 7.73 KiB | |
| xivo-aastra-switchboard | Plugin for Aastra 6731i, 6755i, 6757i in version 3.2.2.2112. | 0.5.1 | - | 08 |
| xivo-cisco-pap2t-5.1.6 | Plugin for Cisco PAP2T in version 5.1.6. | 1.0 | 12.48 KiB | • |
| xivo-cisco-sccp-8.5.2 | Plugin for Cisco 7906G, 7911G, 7931G, 7941G, 7941G-GE, 7942G, 794 | 1.1 | 6.63 KiB | ٠ |
| xivo-cisco-sccp-9.0.3 | Plugin for Cisco 7906G, 7911G, 7941G, 7941G-GE, 7942G, 7961G and | 0.5 | - | 08 |
| xivo-cisco-sccp-9.4 | Plugin for Cisco 7906G, 7911G, 7931G, 7941G, 7941G-GE, 7942G, 796 | 1.1 | 6.78 KiB | ٠ |
| xivo-cisco-sccp-cipc-2.1 | Plugin for Cisco IP Communicator in version 2.1.2. | 1.1 | 5.59 KiB | + |
| xivo-cisco-sccp-legacy | Plugin for Cisco 7905G, 7912G, 7920, 7940G and 7960G in different | 1.1.1 | 6.86 KiB | 0 🗙 |
| xivo-cisco-sccp-wireless | Plugin for Cisco 7921G in version 1.4.5 of the SCCP software. <td>1.1</td> <td>6.05 KiB</td> <td>+</td> | 1.1 | 6.05 KiB | + |
| xivo-cisco-spa-7.5.5 | Plugin for Cisco SMB SPA301, 303, 501G, 502G, 504G, 508G, 509G, 5 | 1.0 | 13.58 KiB | × |

At this point you should have a fully functional DHCP server that provides IP address to your phones. Depending on what type of CISCO phone you have, you need to install the plugin sccp-legacy, sccp-9.4 or both.

Note: Please refer to the *Provisioning page* for more information on how to install CISCO firmwares.

Once your plugin is installed, you'll be able to edit which firmwares and locales you need. If you are unsure, you can choose all without any problem.

Plugins > Edit plugin xivo-cisco-sccp-legacy v. 1.1.1

| 114 | C | 0 | rı | n | tı | 0 | n | |
|---------|---|---|----|---|----|---|---|--|
| D | 0 | J | | μ | u | υ | | |

Plugin for Cisco 7905G, 7912G, 7920, 7940G and 7960G in different versions of the SCCP software. Please see the documentation if you want to install Cisco firmwares.

| Name | Description | Size | Version | Action |
|------------------|------------------------------------|------------|-----------|--------|
| 7905-fw | Firmware for Cisco 7905G | 657.39 KiB | 8.0.3 | • |

| SAVE | | | | | | | | | |

Fig. 5.41: Add a line to a user

Congratulations ! Your SCCP phone is now ready to be called !

5.26.4 Function keys

With SCCP phones, the only function keys that can be configured are:

- Key: Only the order is important, not the number
- Type: Customized; Any other type doesn't work
- Destination: Any valid extension
- Label: Any label
- Supervision: Enabled or Disabled

5.26.5 Direct Media

SCCP Phones support directmedia (direct RTP). In order for SCCP phones to use directmedia, one must enable the directmedia $Services \rightarrow IPBX \rightarrow IPBX$ settings $\rightarrow SCCP$ general settings

5.26.6 Features

| Features | Supported |
|------------------------------|-----------|
| Receive call | Yes |
| Initiate call | Yes |
| Hangup call | Yes |
| Transfer call | Yes |
| Congestion Signal | Yes |
| Autoanswer (custom dialplan) | Yes |
| Call forward | Yes |
| Multi-instance per line | Yes |
| Message waiting indication | Yes |
| Music on hold | Yes |
| Context per line | Yes |
| Paging | Yes |
| Direct RTP | Yes |
| Redial | Yes |
| Speed dial | Yes |
| BLF (Supervision) | Yes |
| Resync device configuration | Yes |
| Do not disturb (DND) | Yes |
| Group listen | Yes |
| Caller ID | Yes |
| Connected line ID | Yes |
| Group pickup | Yes |
| Auto-provisioning | Not yet |
| Multi line | Not yet |
| Codec selection | Yes |

| Type of Service (TOS) | Manual |

5.26.7 Telephone

| Device type | Supported | Firmware version | Timezone aware |
|-------------|-----------|-------------------|----------------|
| 7905 | Yes | 8.0.3 | No |
| 7906 | Yes | SCCP11.9-4-2SR1-1 | Yes |
| 7911 | Yes | SCCP11.9-4-2SR1-1 | Yes |
| 7912 | Yes | 8.0.4(080108A) | No |
| 7920 | Yes | 3.0.2 | No |
| 7921 | Yes | 1.4.5.3 | Yes |
| 7931 | Yes | SCCP31.9-4-2SR1-1 | Yes |
| 7937 | Testing | | |
| 7940 | Yes | 8.1(SR.2) | No |
| 7941 | Yes | SCCP41.9-4-2SR1-1 | Yes |
| 7941GE | Yes | SCCP41.9-4-2SR1-1 | Yes |
| 7942 | Yes | SCCP42.9-4-2SR1-1 | Yes |
| 7945 | Testing | | |
| 7960 | Yes | 8.1(SR.2) | No |
| 7961 | Yes | SCCP41.9-4-2SR1-1 | Yes |
| 7962 | Yes | SCCP42.9-4-2SR1-1 | Yes |
| 7965 | Testing | | |
| 7970 | Testing | | |
| 7975 | Testing | | |
| CIPC | Yes | 2.1.2 | Yes |

Models not listed in the table above won't be able to connect to Asterisk at all. Models listed as "Testing" are not yet officially supported in XiVO: use them at your own risk.

The "Timezone aware" column indicates if the device supports the timezone tag in its configuration file, i.e. in the file that the device request to the provisioning server when it boots. If you have devices that don't support the timezone tag and these devices are in a different timezone than the one of the XiVO, you can look at the issue #5161 for a potential solution.

5.27 Schedules

Schedules are specific time frames that can be defined to open or close a service. Within schedules you may specify opening days and hours or close days and hours.

A default destination as user, group ... can be defined when the schedule is in closed state.

Schedules can be applied to :

- Users
- Groups
- Inbound calls
- · Outbound calls
- Queues

5.27.1 Creating Schedules

A schedule is composed of a name, a timezone, one or more opening hours or days that you may setup using a calendar widget, a destination to be used when the schedule state is closed.

With the calendar widget you may select months, days of month, days of week and opening time.

You may also optionally select closed hours and destination to be applied when period is inside the main schedule. For example, your main schedule is opened between 08h00 and 18h00, but you are closed between 12h00 and 14h00.

5.27.2 Using Schedule on Users

When you have a schedule associated to a user, if this user is called during a closed period, the caller will first hear a prompt saying the call is being transferred before being actually redirected to the closed action of the schedule.

If you don't want this prompt to be played, you can change the behaviour by:

- 1. editing the /etc/xivo/asterisk/xivo_globals.conf file and setting the XIVO_FWD_SCHEDULE_OUT_ISDA to 1
- 2. reloading the asterisk dialplan with an asterisk -rx "dialplan reload".

5.28 Sound Files

5.28.1 Add Sounds Files

On a fresh install, only en_US and fr_FR sounds are installed. Canadian French and German are available too.

To install Canadian French sounds you have to execute the following command:

apt-get install asterisk-sounds-wav-fr-ca xivo-sounds-fr-ca

| Schedule | <mark>s</mark> > Add | | | |
|-----------------------------|----------------------|------------------------------|---|--|
| General | Closed h | ours | | |
| | Entity: Name: | iγl-entity ▼ workinghours | | |

Fig. 5.44: Schedule closed hours

To install German sounds you have to execute the following command:

```
apt-get install asterisk-sounds-wav-de-de xivo-sounds-de-de
```

Now you may select the newly installed language for your users.

5.28.2 Convert Your Wav File

Asterisk will read natively WAV files encoded in wav 8kHz, 16 bits, mono.

The following command will return the encoding format of the <file>

```
$ file <file>
RIFF (little-endian) data, WAVE audio, Microsoft PCM, 16 bit, mono 8000 Hz
```

The following command will re-encode the <input file> with the correct parameters for asterisk and write into the <output file>:

sox <input file> -b 16 -c 1 -t wav <output file> rate -I 8000

5.29 Switchboard

This page describes the configuration needed to have a switchboard on your XiVO.

5.29.1 Overview

Switchboard functionality is available in the XiVO client. The goal of this page is to explain how to configure your switchboard and how to use it.

The switchboard xlet and profile allow an operator to view incoming calls, answer them, put calls on hold, view the calls on hold and pick up the calls on hold.

5.29.2 Limitations

Note: The shortcut keys of the switchboard do not work on the Mac version of the XiVO client.

Note: The enter shortcut to answer a call will not work if the focus is currently on a widget that will consume the key press. ie: a text field, a drop down

Note: Attended transfers to the switchboard cannot be managed with the switchboard xlets depending on the moment at which the call was completed.

5.29.3 Table of Contents

Switchboard Configuration

Be sure to read the *limitations* before configuring a switchboard.

Server configuration

Quick Summary

In order to configure a switchboard on your XiVO, you need to:

- Create a queue for your switchboard
- Create a queue for your switchboard's calls on hold
- Create the users that will be operators
- Activate the switchboard option for your phone
- Create an agent for your user
- Assign the incoming calls to the switchboard queue
- For each operator, add a function key for logging in or logging out from the switchboard queue.
- Set "no answer" destinations on the switchboard queue

Supported Devices

The supported phones for the switchboard are:

| Brand | Model | XiVO version | Plugin version |
|---------|---------|--------------|--------------------------------|
| Aastra | 6755i | >= 14.07 | >= xivo-aastra-3.3.1-SP2, v1.0 |
| Aastra | 6757i | >= 14.07 | >= xivo-aastra-3.3.1-SP2, v1.0 |
| Aastra | 6735i | >= 14.07 | >= xivo-aastra-3.3.1-SP2, v1.2 |
| Aastra | 6737i | >= 14.07 | >= xivo-aastra-3.3.1-SP2, v1.2 |
| Polycom | VVX 400 | >= 15.11 | >= xivo-polycom-5.3.0, v1.3 |
| Polycom | VVX 410 | >= 15.11 | >= xivo-polycom-5.3.0, v1.3 |
| Snom | 720 | >= 14.14 | >= xivo-snom-8.7.3.25.5, v1.0 |
| Snom | D725 | >= 14.14 | >= xivo-snom-8.7.5.17, v1.4 |
| Yealink | T46G | >= 15.01 | >= xivo-yealink-72.0, v1.22.1 |

Create a Queue for Your Switchboard

All calls to the switchboard will first be distributed to a switchboard queue.

To create this queue, go to Services \rightarrow Call center \rightarrow Queues and click the add button.

| Queues > Edit switchboard (9@default) | | | | | |
|--|------------------|-------------------|--------------|-----------|----------|
| General | Announces | Members | Application | No answer | Advanced |
| | | Name: | switchboa | ard | |
| | | Display name: | Switchboard | I | |
| | | Number: | 9 | | |
| | | Ring strategy: | Least recen | nt 🔻 🛛 | |
| | | Context: | Default (def | fault) | • |
| | | On-Hold Music: | guitar | v 😧 | |
| Add an anno | ounce | | | | |
| | Customize the na | me of the caller: | | v | |
| | Preproc | ess subroutine: | xivo_subr_s | witchbc | |
| | | | | | |

SAVE

The following configuration is mandatory

- The General \rightarrow Name field has to be __switchboard
- The General \rightarrow Ring strategy field has to be Ring all
- The General \rightarrow Preprocess subroutine field has to be xivo_subr_switchboard
- The Application \rightarrow Allow caller to hang up call option has to be enabled
- The Application \rightarrow Allow callee to transfer the call option has to be enabled
- The *Advanced* \rightarrow *Member reachability timeout* option has to be *disabled*
- The Advanced \rightarrow Time before retrying a call to a member option has to be 1 second

- The Advanced \rightarrow Delay before reassigning a call option has to be disabled
- The Advanced \rightarrow Call a member already on option has to be disabled
- The Advanced \rightarrow Autopause agents option has to be No

Other important fields

- The General \rightarrow Display name field is the name displayed in the XiVO client xlets and in the statistics
- The General \rightarrow Number field is the number that will be used to reach the switchboard internally (typically 9)

Create a Queue for Your Switchboard on Hold

The switchboard uses a queue to track its calls on hold.

To create this queue, go to Services \rightarrow Call center \rightarrow Queues and click the add button.

The following configuration is mandatory

- The General \rightarrow Name field has to be __switchboard_hold
- The General \rightarrow Number field has to be a valid number in a context reachable by the switchboard
- The Advanced \rightarrow Join an empty queue option list has to be empty
- The Advanced \rightarrow Remove callers if there are no agents option list has to be empty

Other important fields

• The General → Display name field is the name displayed in the XiVO client xlets and in the statistics

Warning: This queue MUST have NO members

Create the Users that Will be Operators

Each operator needs to have a user configured with a line. The XiVO client profile has to be set to Switchboard.

The following configuration is mandatory for switchboard users

- The General \rightarrow First name field has to be set
- The General \rightarrow Enable XiVO Client option has to be enabled
- The General \rightarrow Login field has to be set
- The General \rightarrow Password field has to be set
- The General \rightarrow Profile field has to be set to Switchboard
- The $Lines \rightarrow Number$ field has to have a valid extension
- The *Lines* \rightarrow *Device* field has to be a *supported device*
- The Services \rightarrow Enable call transfer option has to be enabled
- The Services \rightarrow Enable supervision option has to be enabled

Activate the Switchboard Option for your Phone

The switchboard option must be activated on the phone. It's possible to activate this option only on *supported phones* and plugins.

• Edit device associated to your user in Services → Devices

| Users > Edit Poste1 | 052 - Provision | ing: <186242> | > | | |

Polycom Phones

To be able to use a Polycom phone for the switchboard, the XiVO must be able to do HTTP requests to the phone. This might be problematic if there's a NAT between your XiVO and your phone.

It's possible to configure the Polycom switchboard via the *configuration files* of xivo-ctid. The following options are available:

```
switchboard_polycom:
    username: xivo_switchboard
    password: xivo_switchboard
    answer_delay: 0.5
```

You will also need to change the XML API username/password by creating a custom template for your phone.

Snom Phones

When using a Snom switchboard, you must not configure a function key on position 1.

To be able to use a Snom phone for the switchboard, the XiVO must be able to do HTTP requests to the phone. This might be problematic if there's a NAT between your XiVO and your phone. The following command should work from your XiVO's bash command line wget http://guest:guest@<phone IP

address>/command.htm?key=SPEAKER. If this command does not activate the phone's speaker, your network configuration will have to be *fixed* before you can use the Snom switchboard.

It's possible to configure the Snom switchboard via the *configuration files* of xivo-ctid. The following options are available:

```
switchboard_snom:
    username: guest
    password: guest
    answer_delay: 0.5
```

You have to change the username and password option if you have changed the administrator username or administrator password for your phone in *Configuration* \rightarrow *Provisioning* \rightarrow *Template Device*.

Yealink Phones

When using a Yealink switchboard, you must not configure a function key on position 1.

Create an Agent for the Operator

Each operator needs to have an associated agent.

Warning: Each agent MUST ONLY be a member of the Switchboard queue

To create an agent:

- Go to Services \rightarrow Call center \rightarrow Agents
- Click on the group *default*
- Click on the Add button
- Associate the user to the agent in the Users tab
- Assign the Agent to the Switchboard Queue (and ONLY to the Switchboard queue)

Send Incoming Calls to the Switchboard Queue

Incoming calls must be sent to the *Switchboard* queue to be distributed to the operators. To do this, we have to change the destination of our incoming call for the switchboard queue.

In this example, we associate our incoming call (DID 444) to our Switchboard queue:

Set "No Answer" Destinations on the Switchboard Queue

When there are no operators available to answer a call, "No Answer" destinations should be used to redirect calls towards another destination.

You also need to set the timeout of the Switchboard queue to know when calls will be redirected.

The reachability timeout must not be disabled nor be too short.

The time before retrying a call to a member should be as low as possible (1 second).

In this example we redirect "No Answer", "Busy" and "Congestion" calls to the *everyone* group and "Fail" calls to the *guardian* user.

You can also choose to redirect all the calls to another user or a voice mail.

XiVO Client configuration

Directory xlet

The transfer destination is chosen in the Directory xlet. You **must** follow the *Directory Xlet* section to be able to use it.

Configuration for multiple switchboards

The above documentation can be used for multiple switchboards on the same XiVO by replacing the *__switchboard* and *__switchboard_hold* queues name and configuring the operators XiVO client accordingly in the XiVO Client \rightarrow Configure \rightarrow Functions \rightarrow Switchboard window.

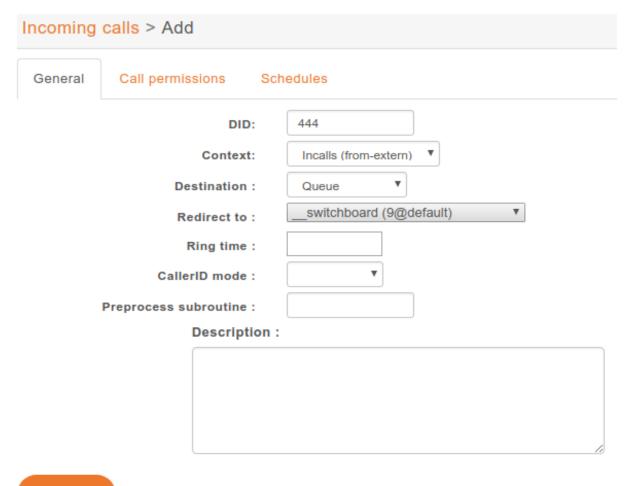

All switchboard queues should be added to the xivo-ctid configuration. New queues can be added by adding a file in /etc/xivo-ctid/conf.d. For example, the following content should be used for a new switchboard queue names __switchboard_two and an hold queue names __switchboard_hold_two.

```
{"switchboard_queues": {"__switchboard_two": true},
    "switchboard_hold_queues": {"__switchboard_hold_two": true}}
```

Switchboard Usage

Warning: The *switchboard configuration* must be completed before using the switchboard. This includes :

- Device, User, Agent and Queues configuration (see above),
- Directory xlet configuration (see *Directory Xlet*)

Call flow

Answering an incoming call

When the switchboard receives a call, the new call is added to the *Incoming Calls* list on the left and the phone starts ringing. The user can answer this call by:

- clicking on any call in the list
- clicking the Answer button
- pressing the *Enter* key

Note: The XiVO Client must be the active window for the keyboard shortcuts to be handled

The operator can select which call to answer by:

- clicking directly on the incoming call
- pressing F6 to select the incoming calls frame and pressing the up and down arrow keys

Selecting a call to answer while talking will not answer the call.

Once the call has been answered, it is removed from the incoming calls list and displayed in the *Current Call* frame.

Making a Call

The switchboard operator can do the following operations:

- Press the *Call* button or press *F3*
- Search for the call destination in the directory xlet
- Press to confirm the selection and start the call

Hanging Up a Call

The switchboard operator can hang up its current call by either:

- Clicking the *Hangup* button
- Pressing the F8 key

If the operator has placed a new call via the *Directory* or *Dial* xlet and that call has not yet been answered, he can cancel it in the same way.

Distributing a call

Once the call has been answered and placed in the current call frame, the operator has 3 choices:

- transfer the call to another user
 - using the Blind transfer button or the F4 key.
 - using the Attended transfer button or the F5 key
- put the call on hold using the Hold button or the F7 key
- end the call using the *Hangup* button or the F8 key.

Transferring a call

Transfer buttons allow the operator to select towards which destination he wishes to transfer the call. This is made through the *Directory* xlet. For defails about the xlet *Directory* usage and configuration see *Directory* Xlet.

Once the destination name has been entered, press *Enter*. If multiple destinations are displayed, you can choose by:

- · double-clicking on the destination
- using *Up/Down* arrows then:
 - pressing *Enter*
 - pressing the transfer button again

Blind transfers are straightforward: once the call is transferred, the operator is free to manage other calls.

Attended transfers are a bit more complicated: the operator needs to wait for the transfer destination to answer before completing the transfer.

In this example, the operator is currently asking Bernard Marx if he can transfer Alice Wonderland to him.

| | Charlie Chaplin 103 Disponible 🗘 | - | gent 103 Connected to 10 Unpaused | 03 | Phone 103 En ligne O No option | U appelle | | | |
|-----------|--|-------|---|---------------------------------|--------------------------------------|-----------------|-------------------|-----------------|-----|
| Switchboa | ď | | | | | Ø 🕱 | Directory | | đ× |
| | t Call nter Iswer | Alice | F4 Blind Wunderland < | Complete 1 | F7 | 2F8 Cancel T | bernard 3 Name | Number Location | |
| Incomi | ng Calls Name Number | Time | 0 calls | iting Calls (F9) Name Number | Time | 0 call | | | |
| | | | | | | | Dial | | x o |

- 1. Complete transfer button
- 2. Cancel transfer button
- 3. Transfer destination filtering field (xlet *Directory*)
- 4. Transfer destination list (xlet *Directory*)

Once the destination has answered, you can:

- cancel the transfer with F8 key
- complete the transfer with F5 key

Note: The operator can not complete an attended transfer while the transfer destination is ringing. In this case, the operator must cancel the attended transfer and use the *Blind transfer* action.

Putting a call on hold

If the user places the call on hold, it will be removed from the *Current call* frame and displayed in the *Waiting calls* list. The time counter shows how long the call has been waiting, thus it will be reset each time the call returns in the *Waiting calls* list. The calls are ordered from the oldest to the newest.

Retrieving a call on hold

Once a call has been placed on hold, the operator will most certainly want to retrieve that call later to distribute it to another destination.

To retrieve a call on hold:

- click the desired call in the Waiting calls list
- with the keyboard:
 - move the focus to the *Waiting calls* list (F9 key)
 - choose the desired call with the arrow keys
 - press the *Enter* key.

Once a call has been retrieved from the *Waiting calls* list, it is moved back into the *Current Call* frame, ready to be distributed.

Switchboard Statistics

Limitations

Note: Statistics are produced by *xivo-ctid*. If a call is received when *xivo-ctid* is stopped, no statistics will be produced for that call.

Note: Statistics are only generated for calls answered in XiVO 16.03.

Note: Statistics are only available for existing switchboard queues, i.e. deleting a queue will also delete the associated statistics.

Daily Statistics

Switchboard statistics can be retrieved in CSV format via the web interface in Services \rightarrow Statistics \rightarrow Switchboard \rightarrow Statistics.

| XIVO Services - Con | figuration About | |
|------------------------------|------------------------|----------------------|
| Statistics | Switchboard Statistics | |
| Call Center Configuration | Switchboard: | Switchboard T |
| Queue Performance agents | Start date: | 2018-04-02 |
| Period details | End date: | 2018-04-03 |
| Switchboard Statistics | SEARCH | |

- Start date: when empty, the result will contain statistics from the beginning
- End date: when empty, the result will contain statistics until the current time

Note: Switchboard statistics older than a year are automatically removed. See Purge Logs for more details.

Report

The generated CSV report includes the following columns:

- date: The date at which the calls were received
- entered: The number of calls to the switchboard for the given date excluding calls when the switchboard was closed (e.g. with a *schedule*)
- answered: The number of calls that have been answered by the operator and then transferred or completed by the operator
- transferred: The number of calls that have been transferred by the switchboard operator to another destination
- abandoned: The number of calls that have been abandoned in the switchboard queue or while waiting in the hold queue
- forwarded: The number of calls that have been forwarded to another destination:
 - a call reaching a full queue
 - a call waiting until the max ring time is reached
 - a call forwarded because of a diversion rule
 - a call forwarded because of a leave empty condition
- waiting_time_average: The average time spent in the switchboard and hold queue for all calls that entered the switchboard

Events

Switchboard statistic events are published on the bus to be consumed by collectd.

Configuration

In order to process these events, you need:

• collectd installed on your XiVO: apt-get install collectd

• In /etc/collectd/collectd.conf.d/amqp.conf, configure collectd to read events from the bus (RabbitMQ):

• another service receiving events from collectd, e.g. logstash, graphite, another collectd.

Event description

The collectd events have the following attributes:

- host: the UUID of the XiVO.
- plugin: switchboard
- plugin_instance: the name (not the display name) of the queue for incoming calls of the switchboard.
- type: counter or gauge.
- type_instance: the following values.
- **entered** This event is produced when a call enters the switchboard on an open schedule. Calls that did not enter the queue, if the queue was full for example, will also generate an entered event.
- **abandoned** This event is produced when the called hangs up while waiting in the incoming queue or in the hold queue.
- **transferred** This event is produced when a call is transferred from the switchboard by the operator. For attended transfers, the event is sent when the transfer is completed.
- forwarded This event is produced when a call is redirected to another destination under certain conditions. This include:
 - When the queue is full
 - When the queue timeout is reached
 - When no agent are logged with a join empty configuration
 - When a divertion occured
- **completed** This event is produced when a call was answered by the operator without being transferred to another destination.
- **wait_time** This event is produced when a call is completed, its value is the sum of all times spent in the hold queue and the time spent in the incoming queue before being answered.

Directory Xlet

Overview

Warning: This xlet should only be used with a Switchboard profile. It is not meant to be used alone.

The goal of the directory xlet is to allow the user to search through XiVO users, directory entries and arbitrary numbers to be able to call and transfer calls to these destinations.

| Directory | | | | | | |
|-----------|--------|--------|----------|--|--|--|
| 100 | | | | | | |
| | Name | Number | Location | | | |
| C | Alìce | 1001 | Québec | | | |
| C | Bõb | 1002 | | | | |
| C | Carlõs | 1003 | | | | |
| 6 | Dave | 1004 | | | | |
| 9 | | 100 | | | | |
| | | | | | | |

Usage

The list of entries in the xlet is searched using the top field. Entries are filtered by column content. The entry list will initially appear as empty.

If the current search term is a valid number, it will be displayed in the result list with no name to allow transfer to numbers that are not currently in the phonebook or configured on the XiVO.

Legend

Users available
Users ringing
Users talking
Users

Mobile phone
External contacts
Current search (not a contact)

Phonebook

Phonebook searches are triggered after the user has entered 3 characters. Results from remote directories will appear after 1 second.

If a directory entry as the same number as a mobile or a phone configured on the XiVO, it's extra columns will be added to the corresponding entry instead of creating a new line in the search result.

For example:

If *User 1* has number *1000* and is also in a configured LDAP with a location in "Québec", if the display filter contains the *Location* column, the entry for *User 1* will show "Québec" in the *Location* column after the search results are received.

Configuration

Context

The directory xlet needs a special context named <u>____switchboard_directory</u>. In Services \rightarrow IPBX \rightarrow IPBX configuration \rightarrow Contexts add a new context with the following parameters :

- Name: ____switchboard_directory
- Type of context : Other
- Display name : Switchboard

| Name | Displayed name | Context type | Entity | Action |
|-----------------------|-----------------|--------------|-------------------------|--------------|
| cha | cha10x | Internal | jyl-entity (jyl-entity) | \bigotimes |
| cof | cof11x | Internal | jyl-entity (jyl-entity) | Ø |
| default | Default | Internal | jyl-entity (jyl-entity) | \bigotimes |
| exit_with_pound | exit_with_pound | Internal | jyl-entity (jyl-entity) | \checkmark |
| from-extern | Incalls | Incall | jyl-entity (jyl-entity) | \checkmark |
| michel | michel | Internal | jyl-entity (jyl-entity) | \checkmark |
| routage | routage | Outcall | jyl-entity (jyl-entity) | \checkmark |
| switchboard_directory | Switchboard | Other | - | |

Display filter

A new display filter must be created for the directory xlet.

The following fields must be configured with the correct value for the *Field type* column in order for entries to be displayed in the xlet:

1. status is the column that will be used to display the status icon, the title can be empty

Filters > Update displays

Name:

switchboard

| Field title | Field type | Default value | Field name | Ð |
|-------------|---------------|---------------|------------|---|
| | status | | | × |
| Name | name | | name | × |
| Number | number_office | | number | ۲ |
| Number | number_mobile | | number | ۲ |

Description

You need to restart the Dird server to apply changes.

- 2. name is displayed in the Name column of the xlet
- 3. number_office is displayed in the Number column with a phone icon in the xlet
- 4. number_mobile is displayed in the Number column with a mobile icon in the xlet
- 5. *number_*... any other field starting with *number_* will be displayed in the *Number* column of the xlet with a generic directory icon
- 6. Any other field will be displayed in their own column of the directory xlet

The values in the Field name column must contain values that were created in the Directory definition.

The title used for the Number column is the title of the first field whose type starts with number_.

Note: The field title of the first number column will be used for the header title in the xlet.

Warning: Make sure that the fields entered in the display format are also available in the directory definition, otherwise the filter will not return any results

Context and filter association

The new Display filter has to be assigned to the __switchboard_directory context

```
Direct directories > Edit CTI context
```

```
Name:
switchboard directory

Display filte:

switchboard

Directories

2 items selected

Remove all

Add all

Add all

internal

xivodir

avencall

Description

Su need to restart the Dird server to apply changes.
```

You can then choose which directories will be searched by the Xlet.

Warning: You must not select internal directory, as it is already handled.

LDAP Configuration

To search in Idap directories, you must have an LDAP server configured. See LDAP for more details.

LDAP filter

If you already have an LDAP filter configured for the *Remote directory* Xlet, you can use it. If not, please refer to *Add a LDAP Filter*. configuration.rst

Include the new directory for lookup

You must use the new LDAP filter in the Context and filter association step.

5.30 Users

Users Configuration.

5.30.1 User Import and Export

CSV Import

Users can be imported and associated to other resources by use of a CSV file. CSV Importation can be used in situations where you need to modify many users at the same in an efficient manner, or for migrating users from one system to another. A CSV file can be created and edited by spreadsheet tools such as Excel, LibreOffice/OpenOffice Calc, etc.

CSV file

The first line of a CSV file contains a list of field names (also sometimes called "columns"). Each new line afterwards are users to import. CSV data must respect the following conditions:

- Files must be encoded in UTF-8
- Fields must be separated with a,
- Fields can be optionally quoted with a "
- Double-quotes can be escaped by writing them twice (e.g. Robert ""Bob"" Jenkins)
- Empty fields or headers that are not defined will be considered null.
- Fields of type *bool* must be either 0 for false, or 1 for true.
- Fields of type *int* must be a positive number

In the following tables, columns have been grouped according to their resource. Each resource is created and associated to its user when all required fields for that resource are present.

User

| Field | Туре | Re- | Values | Description |
|----------------------|-------------------|--------|-------------------------|--|
| | | quired | | |
| entity_id | int | Yes | | Entity ID (Defined in menu Configuration \rightarrow |

Call permissions

| Field | Туре | Re- quired | Values | Description |
|-----------------|----------|---------------|--|---|
| call_permission | s string | | list separated by semi- colons (;) | Names of the call permissions to assign to the user |

Importing a file

Once your file is ready, you can import it via $Services \rightarrow IPBX \rightarrow IPBX$ settings $\rightarrow Users$. At the top of the page there is a plus button. A submenu will appear when the mouse is on top. Click on Import a file.

Examples

The following example defines 3 users who each have a phone number. The first 2 users have a SIP line, where as the last one uses SCCP:

```
entity_id, firstname, lastname, exten, context, line_protocol
1, John, Doe, 1000, default, sip
1, George, Clinton, 1001, default, sip
1, Bill, Bush, 1002, default, sccp
```

Fig. 5.45: Import Users

The following example imports a user with a phone number and a voicemail:

The following exmple imports a user with both an internal and external phone number (e.g. incoming call):

```
entity_id,firstname,lastname,exten,context,line_protocol,incall_exten,incall_

→context

1,John,Doe,1000,default,sip,2050,from-extern
```

CSV Update

The field list for an update is the same as for an import with the addition of the column uuid, which is mandatory. For each line in the CSV file, the updater goes through the following steps:

- 1. Find the user, using the uuid
- 2. For each resource (line, voicemail, extension, etc) find out if it already exists.
- 3. If an existing resource was found, associate it with the user. Otherwise, create it.
- 4. Update all remaining fields

The following restrictions must also be respected during update:

- Columns that are not included in the CSV header will not be updated.
- A field that is empty (i.e, "") will be converted to NULL, which will unset the value.
- A line's protocol cannot be changed (i.e you cannot go from "sip" to "sccp" or vice-versa).
- An incall cannot be updated if the user has more than one incall associated.

Updating is done through the same menu as importing (*Services* \rightarrow *IPBX* \rightarrow *IPBX* settings \rightarrow *Users*). A submenu will appear when the mouse is on top. Click on *Update from file* in the submenu.

| XIVO Services - | Configuration About | | Login: root | Type: Ro | oot 🕐 |

| | Abrohom Mohorho | 101110 cin | 1450 | iot | |

Fig. 5.46: Services \rightarrow IPBX \rightarrow IPBX settings \rightarrow Users \rightarrow Update from file

CSV Export

CSV exports can be used as a scaffold for updating users, or as a means of importing users into another system. An export will generate a CSV file with the same list of columns as an import, with the addition of uuid and provisioning_code.

Exports are done through the same menu as importing (*Services* \rightarrow *IPBX* \rightarrow *IPBX* settings \rightarrow *Users*). Click on *Export to CSV* in the submenu. You will be asked to download a file.

| XIVO Services - C | Configuration About | | Login: roo | t Type: F | Root 😃 | |

Fig. 5.47: Services \rightarrow IPBX \rightarrow IPBX settings \rightarrow Users \rightarrow Export to CSV

5.30.2 Function keys

Function keys can be configured to customize the user's phone keys. Key types are pre-defined and can be browsed through the Type drop-down list. The Supervision field allows the key to be supervised. A supervised key will light up when enabled. In most cases, a user cannot add multiple times exactly the same function key (example : two user function keys pointing to the same user). Adding the same function key multiple times can lead to undefined behavior and generally will delete one of the two function keys.

| Users > I | Edit Brucé Waill - Provisioning: <27627 | 3> | | | | | |
|-----------|---|-----------|--------------|-----------|----------|------------------|---|
| General | Lines No answer Services | Voicemail | Groups | Func Keys | | | |
| Key | Туре | | Destination | | Label | Supervision | (|
| 3 🔻 | Customized | • | ***301000 | | Login | Enabled V | (|
| 4 • | Customized | ¥ | ***341000 | | Pause | Enabled v | (|
| 5 * | Customized | ¥ | 7777 | | callback | Enabled V | (|
| 6 * | User | ¥ | Joéhn Waïnes | | | Enabled • | (|
| 7 🔻 | Connect/Disconnect an agent | T | Brucé Waill | | CDAgent | Enabled V | (|

For User keys, start to key in the user name in destination, XiVO will try to complete with the corresponding user. If the forward unconditional function key is used with no destination the user will be prompted when the user presses the function key and the BLF will monitor *ALL* unconditional forward for this user.

5.30.3 Extensions

*3 (online call recording)

To enable online call recording, you must check the "Enable online call recording" box in the user form.

| Users > Edit Brucé Waill - Provisioning: <276273> | | | | | |
|---|----------------|--------------|--------|-----------|--|
| General Lines No answer | Services | Voicemail | Groups | Func Keys | |

| Do not disturb: | | | | | |
| Filter Boss - Secretary: | No |] | | | |
| Agent: | Brucé Waill (2 | 500@default) | • | | |

Fig. 5.48: Users Services

When this option is activated, the user can press $\star 3$ during a conversation to start/stop online call recording. The recorded file will be available in the monitor directory of the *Services* \rightarrow *IPBX* \rightarrow *Audio files* menu.

*26 (call recording)

You can enable/disable the recording of all calls for a user in 2 different way:

- 1. By checking the "Call recording" box of the user form.
- 2. By using the extension *26 from your phone (the "call recording" option must be activated in Services \rightarrow *IPBX* \rightarrow *Extensions*).

When this option is activated, all calls made to or made by the user will be recorded in the monitor directory of the *Services* \rightarrow *IPBX* \rightarrow *Audio files* menu.

*55 (echo test)

To test your microphone and speaker, you can call the echo test application. The application will echo everything what you speak.

- 1. Dial the *55 number from your phone or application.
- 2. You should hear "Hello World" followed by the "Echo" announcement.
- 3. After the announcement, you will hear everything what you say.
- 4. Press # or hangup to exit the echo test application.

Using this application you may also get the latency between you and the server running the echo test.

5.31 Voicemail

Voicemail Configuration.

5.31.1 General Configuration

The global voicemail configuration is located under $Services \rightarrow IPBX \rightarrow General Settings \rightarrow Voicemails$.

5.31.2 Adding voicemails

There are 2 ways to add a voicemail:

- Using Services \rightarrow IPBX \rightarrow IPBX settings \rightarrow Voicemails
- Using the user's configuration

Using Services \rightarrow IPBX \rightarrow IPBX settings \rightarrow Voicemails

New voicemails can be added using the + button.

Once your voicemail is configured, you have to edit the user configuration and search the voicemail previously created and then associate it to your user.

| IPBX | • | | | SEARCH | Q |

| Delete message after | | | | | |
| notification: | | | | | |

Fig. 5.52: Add a voicemail from the user's configuration

Note: The user's language must be set in the general tab

5.31.3 Disabling a voicemail

You can disable a user's voicemail by un-checking the 'Enable voicemail' option on the Voicemail tab from user's configuration.

| Users > Edit Fernand | lo L'Igüane - Provisioning: | <478483> | | |
|---------------------------------------|-----------------------------|-----------|--------|-----------|
| General Lines | No answer Services | Voicemail | Groups | Func Keys |
| Actions | | | | |
| Search for existing voic | email: | | | |
| Add a new voicemail: | Ð | | | |
| Enable voicemail: | | | | |
| Voicemail | | | | |
| Full name: | Fernando L'Igüane | | | |
| Voicemail: | | | | |
| Password: E-mail: | | | | |
| Context: | Appels internes (default) | ¥ | | |
| Time zone: | eu-fr 🔻 | | | |
| Language: | | | | |
| Maximum number of messages: | | | | |
| Ask password: | | | | |
| Attach the audio file: | v | | | |
| Delete message after notification: | | | | |
| SAVE 2 | | | | |

5.31.4 Deleting a voicemail

Delete voicemail is done on Services \rightarrow IBX \rightarrow IPBX settings \rightarrow Voicemails or from the user's voicemail tab.

Note:

[•] Deleting a voicemail is irreversible. It deletes all messages associated with that voicemail.

• If the voicemail contains messages, the message waiting indication on the phone will not be deactivated until the next phone reboot.

5.31.5 Disable password checking

Unchecking the option Ask password allows you to skip password checking for the voicemail only when it is consulted from an internal context.

- when calling the voicemail with *98
- when calling the voicemail with *99<voicemail number>

Warning: If the the *99 extension is enabled and a user does not have a password on its voicemail, anyone from the same context will be able to listen to its messages, change its password and greeting messages.

However, the password will be asked when the voicemail is consulted through an incoming call. For instance, let's consider the following incoming call:

| Incoming | calls > Add | |
|--------------|--------------|-------------------------------|
| General | Call permis | sions Schedules |
| | DID: | 53123 |
| | Context: | Incalls (from-extern) |
| D | estination : | Application V |
| A | Application: | Voicemail consulting v |
| | Context: 🤇 | default |
| Call | erID mode : | T |
| Preprocess s | ubroutine : | |
| | Descript | ion : |
| | | |
| | | |
| | | |
| | | |
| SAVE | | |

With such a configuration, when calling this incoming call from the outside, we will be asked for:

- the voicemail number we want to consult
- the voicemail password, even if the "Disable password checking option" is activated

And then, we will be granted access to the voicemail.

Take note that the second "context" field contains the context of the voicemail. Voicemails of other contexts will not be accessible through this incoming call.

Warning: For security reasons, such an incoming call should be avoided if a voicemail in the given context has no password.

5.31.6 Advanced configuration

Remote *xivo-confd*

If *xivo-confd* is on a remote host, *xivo-confd-client* configuration will be required to be able to change the voicemail passwords using a phone.

This configuration should be done:

```
mkdir -p /etc/systemd/system/asterisk.service.d
cat >/etc/systemd/system/asterisk.service.d/remote-confd-voicemail.conf <<EOF
[Service]
Environment=CONFD_HOST=localhost
Environment=CONFD_PORT=9486
Environment=CONFD_HTTPS=true
Environment=CONFD_USERNAME=<username>
Environment=CONFD_PASSWORD=<password>
EOF
systemctl daemon-reload
```

5.32 WebRTC

5.32.1 General notes

Note: added in version 2016.04

XiVO comes with a WebRTC lines support, you can use in with XiVO UC Assistant and Desktop Assistant. Before starting, please check the WebRTC Environment.

Current WebRTC implementation requires following configuration steps:

- configure asterisk to accept websocket connections,
- and create user *with one line configured for WebRTC*. To have user with both SIP and WebRTC line is not supported.

5.32.2 Configuration of XiVO PBX for WebRTC

Warning: Security warning: when enabling WebRTC you need to ensure that you do it securely:

- 1. by securing the access to the ARI,
- 2. and by securing (e.g. via an external firewall) the access to the asterisk HTTP server (which listens on port 5039).

First, secure ARI connection (this step is very important otherwise your XiVO PBX won't be secure) :

- Generate a password (e.g. with pwgen -s 16)
- Edit file /etc/asterisk/ari.conf

• replace:

password = Nasheow8Eag

by:

password = <YOUR_GENERATED_PASSWORD>

Then, open asterisk HTTP server to accept outside websocket connections:

- Edit file /etc/asterisk/http.conf
- replace:

bindaddr=127.0.0.1

by:

```
bindaddr=0.0.0.0
```

By default, asterisk HTTP server has a limit of 100 websocket connections. You can change this limit in the /etc/asterisk/http.conf file:

sessionlimit=200

Restart XiVO PBX services to apply the new settings:

xivo-service restart

5.32.3 Configuration of user with WebRTC line

- 1. Create user
- 2. Add line to user without any device
- 3. Edit the line created and, in the *Advanced* tab, add *webrtc=yes* options:

5.32.4 Fallback Configuration

When the user is not connected to its WebRTC line, or disconnect from the assistant, you can route the call to a default number as for example the user mobile number. Update the fail option on the No Answer user tab configuration, and add an extension to the appropriate context.

5.32.5 Experimental video call feature

Note: Since 2018.02 as an experimental feature, susceptible to change or removal at any moment.

Since this feature is experimental, it is disabled by default. Video calls are enabled by setting the environment variable ENABLE_VIDEO to true in the /etc/docker/compose/custom.env file:

```
...
ENABLE_VIDEO=true
```

Then you need to recreate the xucmgt container with xivocc-dcomp up -d xucmgt.

WebRTC users are automatically configured with VP8 video codec to allow video calls, you must disable all other video codecs. Please avoid any specific codec configuration for WebRTC peers and be sure to remote all video codecs from the SIP General settings, tab Signalling, section Codecs. Either do not customize codecs, either do not select any video codecs.

ofile is
dtlsprivatekey = /etc/asterisk/keys/asterisk.pem ; Tell Asterisk where your DTLS_
oprivate key is
```

SAVE

```
dtlssetup = actpass ; Tell Asterisk to use actpass SDP parameter when setting up_

→DTLS
encryption = yes
force_avp = yes
icesupport = yes
transport = ws
```

5.33 Web Services Access

You may configure Web Services / REST API permissions in Configuration \rightarrow Management \rightarrow Web Services Access.

Web services access may have two different meanings:

- Who may access REST APIs of various XiVO daemons, and which resources in those REST APIs?
- Who may access PHP web services under https://xivo.example.com/xivo/ configuration/json.php/*?

5.33.1 REST API access and permissions

Those REST API interfaces are documented on http://<youxivo>.api. They all require an authorization token, obtained by giving valid credentials to the REST API of xivo-auth. The relevant settings are:

- Login/Password: the xivo-auth credentials (for the xivo-auth backend xivo_service)
- ACL: The list of authorized REST API resources. See REST API Permissions.

Unlike PHP web services, there is no host-based authorization, so the Host setting is not relevant.

A few REST API access are automatically generated during the installation of XiVO, so that XiVO services may authenticate each other.

You will probably only need to create such a REST API access when you want another non-XiVO service to communicate with XiVO via REST API.

5.33.2 PHP web services

Warning: DEPRECATED

Those web services are deprecated. There is no documentation about their usage, and the goal is to remove them.

They are still protected with HTTP authentication, requiring a login and password. The relevant settings are:

- Login/Password: the HTTP authentication credentials
- Host: the authorized hosts that are allowed to make HTTP requests:
 - Empty value: HTTP authentication
 - Non-empty value: no HTTP authentication, all requests coming from this host will be accepted. Valid hosts may be: a hostname, an IP address, a CIDR block.

There is no fine-grained permissions: either the user has access to every PHP web services, or none.

Lines > Edit | webrtc <1019>

5.33.3 xivo-confd

Warning: DEPRECATED

There is also a special case for authentication with xivo-confd. See XiVO REST API for more details.

CHAPTER 6

Contact Center

In XiVO, the contact center is implemented to fulfill the following objectives :

• Call routing

Includes basic call distribution using call queues and skills-based routing

• Agent and Supervisor workstation.

Provides the ability to execute contact center actions such as: agent login, agent logout and to receive real time statistics regarding contact center status

• Statistics reporting

Provides contact center management reporting on contact center activities

• Advanced functionalities

Call recording

• Screen Pop-up

6.1 Agents

6.1.1 Introduction

A call center agent is the person who handles incoming or outgoing customer calls for a business. A call center agent might handle account inquiries, customer complaints or support issues. Other names for a call center agent include customer service representative (CSR), telephone sales or service representative (TSR), attendant, associate, operator, account executive or team member.

-SearchCRM

In this respect, agents in XiVO have no fixed line and can login from any registered device.

6.1.2 Getting Started

- Create a user with a SIP line and a provisioned device.
- Create agents.
- Create a queue adding created agent as member of queue.

6.1.3 Creating agents

Service > Call center > Agents > General

These settings are specific for a given agent.

Service > Call center > Agents > Users

These settings are specific for a given agent.

Service > Call center > Agents > Queues

These settings are specific for a given agent.

Service > Call center > Agents > Advanced

These settings are specific for a given agent.

Service > IPBX > General settings > Advanced > Agent

These settings are global for all agents.

6.2 Queues

Call queues are used to distribute calls to the agents subscribed to the queue. Queues are managed on the *Services* \rightarrow *Call Center* \rightarrow *Queues* page.

A queue can be configured with the following options:

- Name: used as an unique id, cannot be general
- Display name: Displayed on the supervisor screen
- On-Hold music: The music the caller will hear. The music is played when waiting and when the call is on hold.

A ring strategy defines how queue members are called when a call enters the queue. A queue can use one of the following ring strategies:

- Linear: For each call, in the same order, starting from the same member
 - For agents: In login order
 - For static members: In definition order
- Least recent: call the member who least recently hung up a call
- Fewest calls: call the member with the fewest completed calls
- Round robin memory: call the "next" member after the one who answered last
- Random: call a member at random

| Queues > | Add | | | | | | |
|-------------|-------------|-----------------|-------------|-----------------------|----------|-----------|------------|
| General | Announces | Members | Application | No answer | Advanced | Schedules | Diversions |
| | | | Name: | | | | |
| | | Display | name: | | | | |
| | | N | umber: | | | | |
| | | Ring st | rategy: | Round robin memory | · • • | | |
| | | C | ontext: | Appels internes (defa | ault) 🔻 | | |
| | | On-Hold | Music: | default 🔻 😧 | | | |
| Add an anno | unce | | _ | | | | |
| | Customize t | the name of the | caller: | • | | | |
| | P | reprocess sub | routine: | | | | |
| SAVE | | | | | | | |

Fig. 6.1: Services \rightarrow Call Center \rightarrow Queues \rightarrow Add

• Weight random: same as random, but taking the member penalty into account

Warning: When editing a queue, you can't change the ring strategy to linear. This is due to an asterisk limitation. Unfortunately, if you want to change the ring strategy of a queue to linear, you'll have to delete it first and then create a new queue with the right strategy.

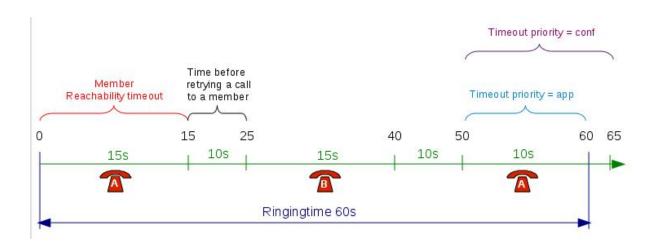

Note: When an agent is a member of many queues, configured with the **same** weight, the order of call distribution between multiple queues is nondeterministic and cannot be configured.

In order to have a deterministic behavior, you MUST configure different weight on each queues.

6.2.1 Timers

You may control how long a call will stay in a queue using different timers:

- Member reachabillity time out (Advanced tab): Maximum number of seconds a call will ring on an agent's phone. If a call is not answered within this time, the call will be forwarded to another agent.
- Time before retrying a call to a member (Advanced tab): Used once a call has reached the "Member reachability time out". The call will be put on hold for the number of seconds alloted before being redirected to another agent.
- Ringing time (Application tab): The total time the call will stay in the queue.
- Timeout priority (Application tab): Determines which timeout to use before ending a call. When set to "configuration", the call will use the "Member reachability time out". When set to "dialplan", the call will use the "Ringing time".

6.2.2 No Answer

Calls can be diverted on no answer:

- No answer: The call reached the "Ringing time" in Application tab and no agent answered the call
- Congestion: The number of calls waiting has reached the "Maximum number of people allowed to wait" limit specified on the advanced tab
- Fail: No agent was available to answer the call when the call entered the queue ("Join an empty queue" condition on the advanced tab) or the call was queued and no agents were available to answer ("Remove callers if there are no agents" on the advanced tab)

6.2.3 Advanced

• Weight: Give the queue a priority to others queues (if agents belong to two or more queues). Check weight warning for

Warning: When configuring a queue with a higher weight, all the calls in this queue will be prioritized over the calls of other queues if they they have the same set of members.

Here, the red call must wait end of orange and green calls. Even if the red calls ring agent first, if for some reasons agent did not answer red call, the red call will have to wait for orange and green. If some others orange or green calls come after, red call will also have to wait.

Actually, red call must wait that queue of weight 2 and queue of weight 1 be completely empty.

6.2.4 Diversions

Diversions can be used to redirect calls to another destination when a queue is very busy. Calls are redirected using one of the two following scenarios:

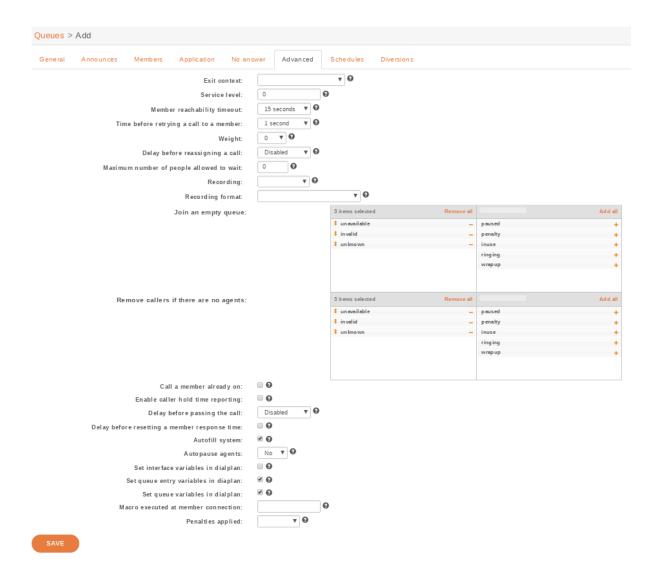

The diversion check is done only once per call, before the *preprocess subroutine* is executed and before the call enters the queue.

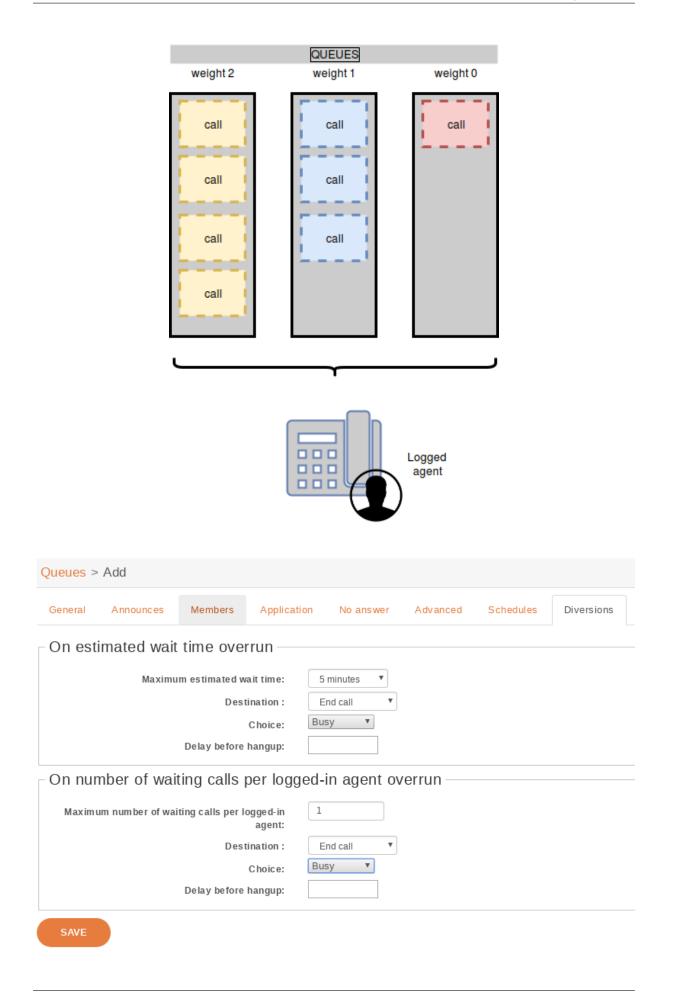

In the following sections, a waiting call is a call that has entered the queue but has not yet been answered by a queue member.

Estimated Wait Time Overrun

When this scenario is used, the administrator can set a destination for calls to be sent to when the estimated waiting time is over the threshold.

| Queues > Add | | | | |
|--|----------------------|-----------|-----------|------------|
| General Announces Members Applic | ation No answer | Advanced | Schedules | Diversions |
| No answer | | | | |
| Destination : | Queue • | | | |
| Redirect to : | blue (3500@loadtest) |) " | 7 | |
| Ring time : | | | | |
| Busy | | | | |
| Destination : | End call | | | |
| | Hangup v | | | |
| Choice: | Trangup - | | | |
| Congestion | | | | |
| Destination : | User 🔻 | | | |
| | acd03 acd03 | v | | |
| Redirect to : | | | | |
| Ring time : | | | | |
| - Fail | | | | |
| Destination : | Voicemail • | | | |
| Redirect to : | LFM Paris (1000@de | efault) 🔻 | 1 | |
| Play occupation message : | | , cally | 1 | |
| Do not play introduction message : | | | | |
| Do not play initiodic for message : Do not play unavailable message : | | | | |
| Use n+101 method : | | | | |
| ose in tot method. | _ | | | |
| SAVE | | | | |

Note that if a new call arrives when there are no waiting calls in the queue, the call will **always** be allowed to enter the queue.

Note:

- this *estimated* waiting time is computed from the **actual hold time** of all **answered** calls in the queue (since last asterisk restart) according to an exponential smoothing formula
- the estimated waiting time of a queue is updated only when a queue member answers a call.

Number of Waiting Calls per Logged-In Agent Overrun

When this scenario is used, the administrator can set a destination for calls to be sent to when the number of waiting calls per logged-in agent is over the threshold.

The number of waiting calls includes the call for which the check is currently being performed.

The number of logged-in agents is the sum of user members and currently logged-in agent members. An agent only needs to be logged in and a member of the queue to participate towards the count of logged-in agents, regardless of whether he is available, on call, on pause or on wrapup.

The maximum number of waiting calls per logged-in agent can have a fractional part.

Here are a few examples:

```
Maximum number of waiting calls per logged-in agent: 1
Current number of waiting calls: 2
Current number of logged-in agents: 2
Number of waiting calls per logged-in agent when a new call arrives: 3 / 2 = 1.5
Call will be redirected
Maximum number of waiting calls per logged-in agent: 0.5
Number of waiting calls: 5
Number of logged-in agents: 12
Number of waiting calls per logged-in agent when a new call arrives: 6 / 12 = 0.5
Call will not be redirected
```

Note that if a new call arrives when there are no waiting calls in the queue, the call will **always** be allowed to enter the queue. For example, in the following scenario:

Maximum number of waiting calls per logged-in agent: 0.5
Current number of waiting calls: 0
Current number of logged-in agents: 1
Number of waiting calls per logged-in agent when a new call arrives: 1 / 1 = 1

Even if the number of waiting calls per logged-in agent (1) is greater than the maximum (0.5), the call will still be accepted since there are currently no waiting calls.

6.3 Contact Center Management

6.3.1 Introduction

CCmanager is a web application to manage and supervise a contact center, different menus are available from hamburger icon with following features:

- 1. Global view: Queues and penalties with real time activity of each agent, possible options are
 - (a) Enable Compact view (remove queue statistics)
 - (b) Show/Hide agents that are not logged in

| XiVO [®] | CC Manager | Victoire Mar | chin 🖒 Sort | ör |
|--|------------|---|-------------------|----|
| ≡ | -14 | Cars, Trucks, 1 | Motorbikes, (5) 🔻 | •] |
| ₩vie Globale II vie Groupe III vie FA ¥vie FA ¥vie Agent ¥vie Rappels Options Vue conpacte Tous les agents | | 3000 - Bles • • • • • • • • • • • • • • • • • • • | | |
| I | | 3000 - Cats 0 Image: Boog Tables 1 155 Att 2 4 155 Att 2 + 3000 - Motobles 0 F 155 Dispo 1 - 4 155 Att 2 + 3000 - Motobles 0 + - 4 155 Att - - < | | |

- 2. Group view: Distribution of agents per queues
- 3. Queue view: Activity per queue
- 4. Agent view: Activity per agent, possible actions are¹
 - (a) Login / Logout
 - (b) Pause / Available
 - (c) Listen²
 - (d) Call²
- 5. Callback view: List of callbacks

Start the application : http://<xucmgt:port>/ccmanager

6.3.2 Authorizations and Access Control

Access to the application is restricted to authorized users (see Access authorizations in CCManager).

6.3.3 Queue statistics

This diagram shows some aggregation about statistics collected from queue activity

- 1. Percentage of calls answered before 15s
- 2. Percentage of calls abandoned after 15s
- 3. Number of available agents to take calls
- 4. Number of pending calls not answered yet

6.3.4 Editing Agent Configuration

This interface allows a user to change queue assignement and the associated penalty. The queue table display the following columns

¹ Available actions depend on the state of the agent

² Only supervisors which have their own line can listen to or call agents, not supported for mobile supervisors, a line has to be affected to supervisors in xivo

| 1601 Rob | perto Akim | R 2701 | | | × |
|---------------|-------------------------|---------------|----------|------|-----------------------------|
| Group presa | lles 🗸 | Set default → | | 🗲 Se | t current |
| Number ¢ | Name ≑ | Penalty - | _ | defa | ault ¢ |
| 1 3554 | Sales RRM | 0 | ~ | 0 | |
| 1 3552 | Travels Lin | 0 | ~ | 7 | |
| 1 4553 | Ast11 Account Dpt WR | 0 | ^ V | 2 | × × |
| 4500 | blue | 1 | ~ | 1 | |
| 1 4557 | Ast11 Car Rental RRM | 1 | ^ | 1 | |
| Queue | | ▼ Penalty 0 | | Save | Cancel |

- "Number": The queue number
- "Name": The queue name
- "Penalty": The active penalty for the corresponding queue
- "default": The default penalty for the corresponding queue

The queue/active penalty couples can be saved as default configuration by clicking the "Set default" button, then "Save". The queue/default penalty couples can be saved as active configuration by clicking the "Set current" button, then "Save".

Note: Removing an agent from a queue

- Emptying the penalty textbox and saving will remove the queue from the active configuration for the agent.
- Emptying the default textbox and saving will remove the queue from the default configuration for the agent.

6.3.5 Multiple Agent Selection

From agent view you are able to add or remove more than one agent at the same time.

| ¢ Clistete te este | | | Click to e | edit selection |
|------------------------------|-------|----|------------|----------------|
| Click to toggle sele | ction | Nb | - | First Name 🔺 |
| | 00 | | | |
| ❤ a_very_long_group_name (1) | | | | |
| | | 1 | 500 | Brucé |
| ❤ bingba3nguh (2) | | | | |
| | | 3 | 1000 | Francois |
| | | 1 | 23456 | Isaac |
| ❤ boats (1) | | | | |
| | | 1 | 018 | Irêne |

Once the agent selection is done, click on the edit button to display the configuration window

Click on the plus button to add a queue for selection, click on the minus button to remove a queue to the selection. Once queue to add or removed are choosen, click on save button to apply your configuration change.

Click on "Apply default configuration" to apply existing default configuration to all selected users and make it the active configuration. This action only affects users with an existing default configuration, agents whithout default configuration remain unchanged.

6.3.6 Agent Base Configuration

From the agent view, after selecting one or more agents, you can create a base configuration by clicking on one of the menu item in the following drop down:

• 'Create base configuration' will allow you to create a base configuration from scratch for all the selected agents.

| Update a Blanc Sec (1626) | Didascaux | Vee (1686) | × | | | | | |
|---------------------------------|---|---------------|-----------|--|--|--|--|--|
| Add in queues | | | | | | | | |
| | Number 😄 | Name 🔺 | Penalty 🜩 | | | | | |
| | | | | | | | | |
| Remove | from que | eues | | | | | | |
| | Numb | per ≑ | Name 🔺 | | | | | |
| | | | | | | | | |
| Queue | | - Penalty 0 | | | | | | |
| + - | | | | | | | | |
| | | | | | | | | |
| Apply defau | Apply default configuration Save Cancel | | | | | | | |
| | | _ | | | | | | |

| | Nb \$ | Group \$ | First Name 🔺 | Last Name ≑ | Login ¢ | Log |
|---|--|----------|--------------------|-------------|---------|-----|
| Θ | / - | Select - | | | | |
| • | 🖍 Edit | | | к | - | - |
| | Create base configur Create base configur | | tive configuration | Willis | - | - |
| • | 2007 | default | Carrie | Mathison | - | - |

• 'Create base configuration from active configuration' will allow you to create a base configuration using the selected agents active configuration. The queue membership and penalty populated will be built based on the merged membership of all the selected agents. In case of conflict, the lowest penalty will be used.

In both cases, you will be able to review your changes before applying them. The 'Create base configuration' popup is similar to the single agent edition popup:

| | Сге к (20 | eate base (006) Mathis (2007) | on Willis | on | × |
|---|--------------|--------------------------------------|-----------|-----------|--------|
| l | | Number ¢ | Name ¢ | Penalty ≑ | |
| l | â | 3000 | Cars | 1 | ~ |
| | â | 3001 | Trucks | 3 | ~ |
| ł | â | 3003 | Bikes | 1 | ~ |
| l | Ê | 3006 | Boats | 4 | ~ |
| | Que | ue | Penalty | + | |
| 5 | _ | | _ | Save | cancel |

The queue table display the following columns:

- "Number": The queue number
- "Name": The queue name
- "Penalty": The active penalty for the corresponding queue

Click on the plus button to add a queue for selection. Once your configuration is complete, click on save button to apply your configuration change.

Applying Default Configuration

In order to re-apply or apply a default configuration, you may select agent whose base configuration is different from active configuration.

In the agent view, you will find a new column (Base config.) displaying if the base configuration is different from the active one:

The possible values for this field are:

| | Ba se config. | Nb 0 | First Name | Last Name | Login 0 | Logout ≎ | s | State 0 | Since 0 | Phone 0 | Tot. Pause | Wrapup ≎ | Inb. Calls 0 | Inb. Answ. | Inb. Moy. Com. | Inb. Total Com. | Inb. Unansw. |
|-----|-----------------------------|------|---------------|--------------|-------------|----------|-----|------------|----------|---------|---------------|----------|--------------|---------------|-------------------|--------------------|-----------------|
| / - | Select - | | | | | | | Select - | | | | | | | | | |
| 1 | Different | 2003 | Jack | Bauer | | | ۶ | oggued Out | | | | | | | | | |
| 1 | Ok | 2000 | James | Bond | 22 16:29:58 | • | ₽ F | Ready | 01:49:33 | 1001 | | | | | | | |
| 1 | Ok | 2006 | Agent | к | - | - | ۶ | | | | | | | | | | |
| 1 | n/a | 2001 | Bruce | Willis | | - | ۶ | | | | | | | | | | |
| 1 | n/a | 2007 | Carrie | Mathison | - | ÷ | ۶ | | | | | | | | | | |
| 1 | n/a | 2099 | Switch | Board | - | • | ۶ | | | | | | | | | | |
| 1 | n/a | 2010 | New | Agent | | | ۶ | | | | | | | | | | |
| 1 | n/a | 2005 | Agent | J | - | - | ۶ | | | | | | | | | | |
| 1 | n/a | 2008 | Saul | Berenson | - | + | ۶ | | | | | | | | | | |

- "n/a": The base configuration is not available for this agent
- "Ok" : The base configuration match the active configuration
- "Different": The base configuration does not match the active configuration

You can use this column to filter agent whose base configuration is different from the active one and then apply the default configuration by using the "Edit agent" option.

6.3.7 Thresholds

Color thresholds can be defines for the waiting calls counter and the maximum waiting time counter

| W Ti % A Ti Ti | b Anne Vait Wat Wait WT Ans. 15s vail. alk. otal nsw. • | Waiting Max Wa | Calls iting Time | | 30 | 55 |
|-------------------------------|--|----------------|---------------------|--------|-------------|----------|
| Nb ¢ | Name 🔺 | Wait ¢ | Time Wait ≑ | EWT \$ | %Ans. 15s ≑ | Avail. ¢ |
| 3012 | BI Record | 0 | | 1 | 100.0 | 1 |
| 3014 | BI Record Pause | 0 | | 0 | | 0 |
| 3000 | Blue Ocean | 0 | | 0 | 50.0 | 1 |

Applies to the queue view and the global view

6.3.8 Callbacks

This view allows to manage callback request see Managing Callbacks Using CCManager for details

6.4 CC Agent Environment

Note: This section describes the CC Agent application features. It is available as a web application from your Web Browser. It is also available as a *desktop application* with these additionnal features:

- · show integrated popup when receiving call
- get keyboard shortcut to answer/hangup and make call using Select2Call feature
- handle callto: and tel: links
- be able to minimize the application to a side bar

To install the desktop application, see the desktop application installation page.

What is the CC Agent application ?

CC Agent is a Web application for contact center operators. Some parameters for Recording, Callbacks, Queue control, Pause statuses and Sheet popup may be configured. Instructions can be found in the *configuration section*.

From the interface you will be able to :

- Manage your activities you are subscribed to receive calls.
- See the customer history inside your organization when a call is coming
- Interact with your phone from the call control panel
- · Get some real time statistics of your session

The web application can either be displayed in a minimal bar or be extended as seen in screen shot below when launched as standalone application. See *desktop application*.

| | e nt One Ready - 00: | 16 | | Ľ • 1000 |
|----------------------|--------------------------------|-----------------|-----------|--------------------|
| < C ⁰⁰ 00 | :00:00 | y 00:00: | 00 () 0 | 0:00:00 > |
| Э | | | | 6 |
| History | Activities | Agents | Callbacks | Customer |
| | SEAR | CH OR C | ALL | Q |
| NAME 🕈 | | | SUBS | . ≑ STAT. ≑ |
| My acti | vities | | | |
| big long o | queue nam | e with | ~ | I |
| Outbound | | | х | |
| sales | | | х | = |
| support | | | ж | = |
| Switchbo | ard | | ~ | = |
| Switchbo | ard_hold | | ж | = |

Warning: The application offers support for the WebRTC lines, currently there's a limitation on complementary services like conference or second call which are partially supported.

6.4.1 Login

| | open-minded telecom systems |
|---|--|
| | ≣ <mark>?</mark> ?? ≣ |
| |) is a unified communication system that connect nes inside an organization with public and mobile telephone networks. |
| | |
| С | ONNECTION |
| | USERNAME |
| | PASSWORD |
| | AGENT PHONE NUMBER |
| | Remember me |
| |) Remember me |

Enter your XiVO client username, password and phone set you want to logged to on the login page.

If you are using Kerberos authentication and enabled SSO (see *Kerberos Authentication*), then you only have to set your phone set number, the authentication and login will be done automatically:

6.4.2 Statistics

At the top of the application, *computed statistics* from XUC are displayed to monitor the agent activity. Simply hover the icon to know its definition.

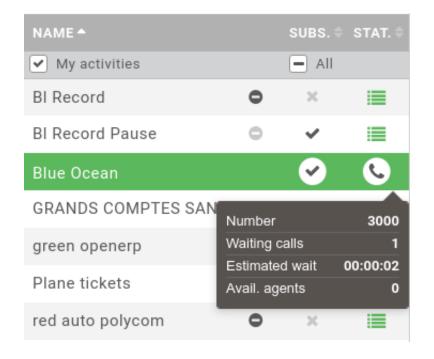

They are updated once current action is over.

6.4.3 Activities

Once logged in you are automatically redirected to activities view, this view contains the list of activities you are registered in.

Hovering an activity triggers a popover which displays some real-time statistics about call distribution in this queue. You may also call or transfer a call to an activity using the displayed phone icon

It is possible to filter on *favorite* activities just by clicking My activities check box.

Activity management

You can manage subscription if allowed globally for the application (see *CCAgent configuration*). If enabled you will be able to enter/quit an activity just by clicking on checkbox associated to it.

Each time you enter an activity, it is automatically added to your favorites. At any time you can remove it by clicking on *minus* sign next to the name in M_Y activities view.

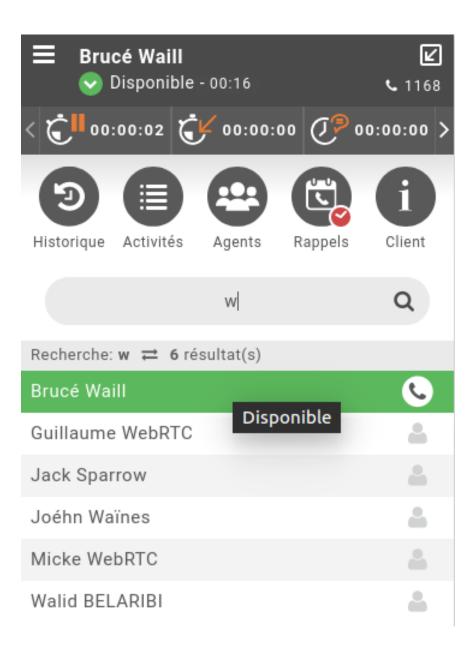

Note: You can remove an activity if and only if you are not already registered in.

It's also possible to enter all your favorites activities just by one click on All checkbox.

| NAME 🕈 | | SUBS. 🗢 | STAT. 🗘 |
|--------------------------|---|---------|---------|
| ✓ My activities | | - All | |
| big long queue name with | | ~ | = |
| Outbound | • | × | = |
| support | | ~ | = |
| Switchboard | 0 | ~ | = |

6.4.4 User directory search

When using the Agent interface, you can at any time search for a user existing in your directory:

Known limitations

• The search support is limited so far to simple words without spaces and simple characters.

6.4.5 Agent list

When clicking on the Agents menu, you will see displayed, all the agents of **your group**. By hovering one of them, you will quickly find his current state (ready, calling, in pause...)

| | e nt One Ready - 00: | :16 | | L • 1100 |
|---------|--------------------------------|--------------------------|------------|---------------------------|
| < C 00 | :00:22 | oo:00 کر | :00 () 00: | 0:00:00 > |
| History | Activities | Agents | Callbacks | G Customer |
| | SEAF | CH OR C | ALL | Q |
| LASTNAM | E 🍝 | FIRSTN | AME 🗘 | STAT. \$ |
| Brideau | | César | | • |
| Savard | | Florus | | 6 |
| Urbain | | Jod Sta Pho Sin | one | Ready 1999 09:55:53 |

A simple click on the phone icon when agent is hovered will trigger a call to its phone number associated.

6.4.6 Call tracking & control

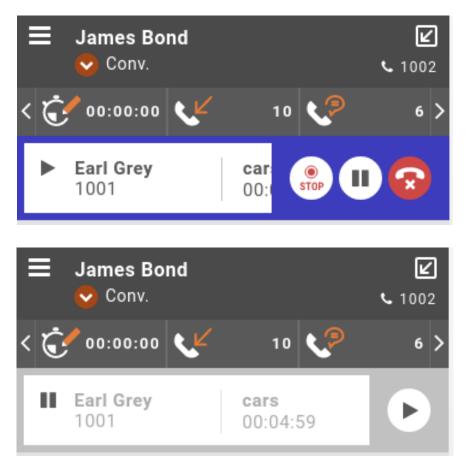

When using the Agent interface, you will see your current calls at the top of the screen:

This panel will display the current caller name & number and also the associated activity if the call came from one. You also have two indicator on the right side letting you know if the call is currently recorded and if the call

is currently listened by a supervisor.

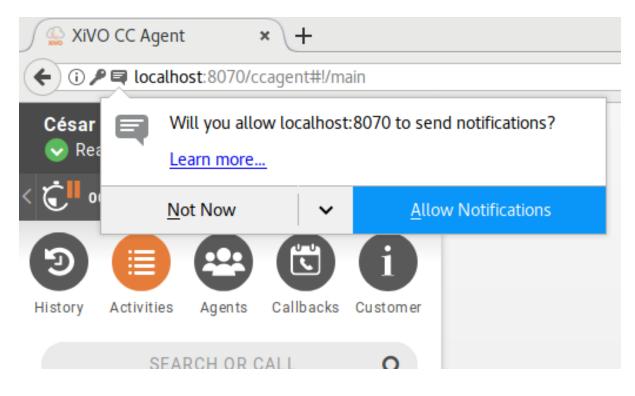

By hovering your mouse on the call line, an action pane will slide to display action button on the related call. The available buttons depend on the call state.

The Agent interface use Desktop notification but this feature needs to be enabled from the browser window when logging in:

Known limitations

- The transfer support is limited, to transfer a call you need to write the number to the search field, then click the attended transfer button and then you can complete the transfer by the complete transfer button.
- Conference and second call except the attended transfer are not supported for agents with webRTC lines.

Also see the phone integration Known limitations.

6.4.7 Agent Call history

First menu History tab is displaying the call history of connected agent.

Information shown in the call list are :

- destination number or name of callee if call is emitted
- source number or name of caller if a call is received or missed
- Call icon status and call start date

By clicking on phone icon you will be able to call back if needed.

Warning: Pay attention that agent history is **not** the phone device history, but his call activity independently the device he is connected to. Actually when agent is logged out, if a call is received on his last used phone, nothing will be shown in his history.

Note: A call answered by another agent from the queue, will appear as answered in the history of the first agent.

6.4.8 Customer Call History

Meanwhile phone is ringing or discussion is ongoing, it is possible to have a quick overview of the customer call history of the caller just by clicking information menu.

The customer history is displayed from most recent to last one with an icon to know quickly waiting time of current or previous call :

- agent with grey *play* icon states for current call
- agent with red *bubble* icon states for an unanswered call

| | elyn Urba Ready - oo: | | | L • 1000 |

| 15:30 | support | 00:02:06 | 2 |
| 15:13 | support | 00:00:53 | 2 |

6.4.9 Customer Call Context

Second tab of information menu displays all attached data enriched to the ongoing call or display Sheet fields if you are using *Sheet Configuration*.

The customer history is displayed from most recent to last one with an icon to know quickly waiting time of current or previous call :

It's also possible to trigger either to open a web page, see *Screen Popup* or completely integrate a third party application while agent is having calls, see *Configuration*.

6.4.10 Callbacks

This view allows to manage callback request see Processing Callbacks with CCAgent for details.

6.5 Recording

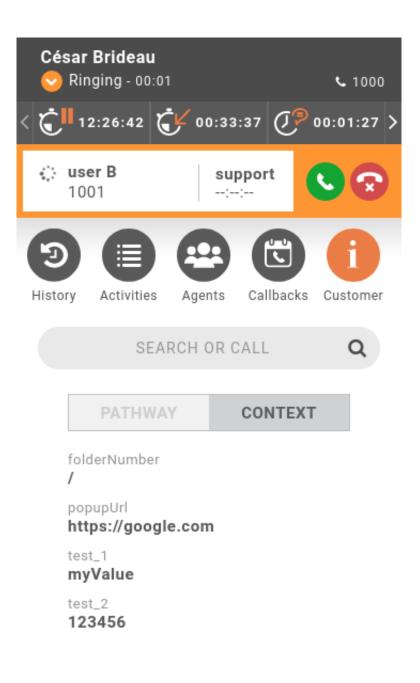

XiVO CC includes a call recording feature: recording is done on *XiVO PBX* and recorded files are sent to the *XiVO CC* Recording server. Then it's possible to search for recordings and download recorded files from *Recording server*.

6.5.1 Recording

For configuring this feature, see Recording configuration.

Description

Recording feature allows to keep the conversation between caller and callee and stores them on dedicated recording server. All the files are then available for download only for predefined *granted* users. Recording is done on *XiVO*

PBX and sent to *Recording server*. If recorded file can't be synchronized on *XiVO CC* Recording Server, files might be found on *XiVO PBX* in

ls -al /var/spool/xivocc-recording/failed

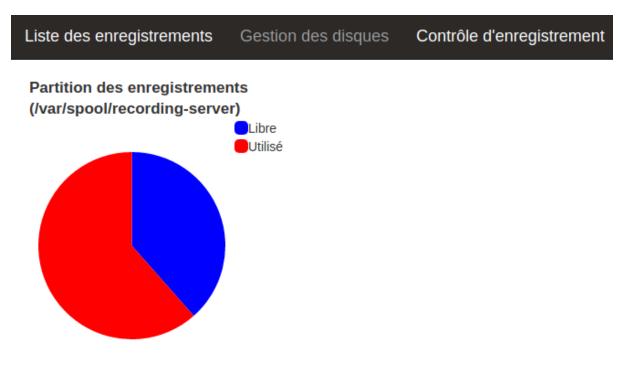

These files will be automatically resynchronized from XiVO PBX to XiVO CC Recording server each night.

You can then search:

- 1. by caller, callee, agent number etc.
- 2. or by callid
- 3. and then download the recording

On *Recording server*, one can monitor the space used by the audio files stored in Contrôle d'enregistrement menu.

Transferred calls recordings

In case an agent has transferred a call to another queue, which was answered by the agent available in that queue, the recording feature will display both agents (name and number) in column **Agent** and both queues (name and number) under column **File** in one recording.

Stop recording upon external transfer

Recording is stopped when both parties of the call are external.

For example if an external incoming call is recorded and if, at some point, it is transferred to an external party, as soon as the transfer is completed, the recording of the incoming call will be stopped.

In the same way if an internal user makes an outgoing call which is recorded and then transfers it to another external party, as soon as the transfer is completed, the recording of the outgoing call will be stopped.

This behavior can be deactivated, see configuration section.

6.5.2 Recording filtering

For configuring this feature, see Recording filtering configuration.

Description

Recording server allows to prevent some numbers not to be recorded.

You can deactivate recording either

- for specific called numbers (called Incalls or called Queues or called Users),
- or, on outgoing calls, for calling Users internal numbers

Note: This feature is designed to activate recording globally (e.g. for every Queues) and then deactivate it for some Queues (e.g. for queue 1001)

To do so, navigate to : http://XIVOCC_IP:9400/recording_control and in page Contrôle d'enregistrement you can add or remove the number to disable recording on this number.

Limitations

- Recording can only be disabled for specific Incalls, Queues, Users and External called numbers.
- Recording can't be disabled for one Agent.
- Recording can only be disabled by the object number (to disable recording for one queue it must have a number).

6.5.3 Gateway recording

For configuring this gateway, see *Gateway recording configuration*.

| ste des enregistrements Gestion des disques Contrôle d'enregistre | ment |
|--|--------------------------|
| Numéros à ne pas enregistrer | |
| Destinataire de l'appel (Numéro Entrant, File d'attente, Utilisateur) | Ajouter un numéro : 4890 |
| 10100 | â |
| 4890 | a |
| 555 | a |
| 77 | a |
| Emetteur ou destinataire d'un appel sortant (Utilisateur ou numéro appelé externe) | Ajouter un numéro : |
| 564546 | a |
| 9999 | â |

Description

This gateway offload the duty of recording file from *XiVO PBX* (as it can be costly due to R/W process) and will synchronize files directly with *Recording server*. It replaces completely the xivo-recording package.

Limitations

When configuring the gateway to handle the recording:

- the pause recording feature
- and the stop recording upon external transfer

are not available.

6.6 Callbacks

6.6.1 Introduction

The goal of the callback system is to be able to perform scheduled outgoing calls. These requests can be completed with specific information such as a description or a personal name.

The core object of the callback system is the callback request. A callback request is made of the following fields:

- First name of person to call
- Last name
- Phone number
- Mobile phone number
- Company name
- Description
- Due date

Each callback request is associated to a predefined **callback period**, which represents the preferred interval of the day in which the call should be performed.

A callback request cannot exist on its own: it must be stored in a **callback list**, which is itself associated to a queue.

Once a callback request has been performed, it generates a **callback ticket**. This ticket sums up the original information of the callback request, but adding some new fields:

- Start date: date at which the callback request was actually performed
- Last update: date of the last modification of the ticket
- Comment
- Status : the result of the callback
- Agent: the Call Center agent who performed the callback

6.6.2 Callback Lists

A callback list is an object which will contain callback request. It is associated to a queue, and several callback lists can be associated to the same queue. Callback lists are created using the **configuration manager**

| Listes de rappel | Périodes de rappel | | |
|---------------------------------------|--------------------|---------------------|--|
| 0 | | | |
| Nom | File d'attente | Nombre de rappels | |
| i i i i i i i i i i i i i i i i i i i | File u attente | Nollible de lappels | |

Once created, a list can be populated whether through the *Callbacks tab* of the CCManager, or programmatically through the web services of the configuration server.

6.6.3 Callback Periods

A callback period represents an interval of the day, bounded by a start date and an end date. It can be set as the default interval, so that a newly created callback request will be associated to this period if none is specified.

| Listes de rappel | Périodes de rappel | | | | | | |
|------------------|--------------------|----------------|--------------|---|---|---|--|
| • | | | | | | | |
| Nom | | Heure de début | Heure de fin | | | | |
| Après-midi | | 14:00:00 | 17:00:00 | | / | ī | |
| Matin | | 08:00:00 | 12:10:00 | | / | Ì | |
| Toute la journée | | 07:00:00 | 17:00:00 | • | 1 | | |

6.6.4 Managing Callbacks Using CCManager

Using the CCManager callback view you may import a list of callbacks, monitor callback completion and download the associated tickets.

Importing Callbacks

Callbacks can be imported from a CSV file into a *callback list*.

Line delimiter must be a new line character and column separator must be one of: 'l' or ',' or ';'. Columns can be optionaly enclosed by double-quote '''.

| élephone ¢ | Mobile \$ | Prénom ¢ | Nom ¢ | Société ¢ | Date - | Période Desc | ription Statut Agent |
|------------|-----------|----------|--------|-------------|------------|------------------|-----------------------|
| | | | | | | | A ra 🔻 |
| 001 | | James | Bond | | 2016-09-04 | Matin | A rappeler James Bond |
| 002 | | Jason | Bourne | | 2016-10-12 | Toute la journée | A rappeler |
| 001 | | | | | 2017-01-10 | Matin | A rappeler |
| 001 | | | | | 2017-01-15 | Matin | A rappeler |
| 002 | 1003 | Jack | Bauer | The Company | 2017-01-20 | Après-midi Test | A rappeler |

The file must look like the following:

```
phoneNumber|mobilePhoneNumber|firstName|lastName|company|description|dueDate|period
0230210092|0689746321|John|Doe|MyCompany|Call back quickly||
0587963214|0789654123|Alice|O'Neill|YourSociety||2016-08-01|Afternoon
```

The header line must contain the exact field named described below:

| Field | Description |
|-------------|---|
| Name | |
| phoneNum- | The number to call (at least either phoneNumber or mobilePhoneNumber is required) |
| ber | |
| mobilePho- | Alternate number to call |
| neNumber | |
| firstName | The contact first name (optional) |
| lastName | The contact last name (optional) |
| description | A text that will appear on the agent callback pane |
| dueDate | The date when to callback, using ISO format: YYYY-MM-DD, ie. 2016-08-01 for August, 1st, |
| | 2016. If not present the next day will be used as dueDate (optional) |
| period | The name of the period as defined in <i>callback list</i> . If not present, the default period will be used |
| | (optional) |

When an agent takes a callback, the column Taken by is updated with the number of the agent. The callback disappears when it is processed.

Exporting Callbacks Tickets

The tickets of the processed callbacks can be downloaded by clicking on the Download tickets button.

The downloaded file is a csv file with the comma ',' as delimiter.

6.6.5 Processing Callbacks with CCAgent

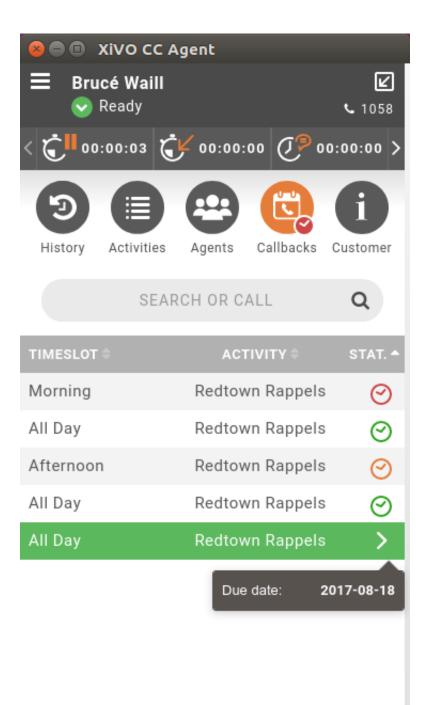

The agent can see the *callbacks* related to the queues he is logged on. They are available in the Callbacks menu. A notification is also shown to display pending callbacks in menu to know status at any time and from any other screen of the application.

On this page, the agent only has access to basic information about the callback: activity and due date, On the left of each callback line, a colored clock indicates the temporal status of this callback:

- yellow if the callback is to be processed later
- green if we are currently inside the callback period
- *red* if the callback period is over

To process one of these callbacks, the agent must click on one of the callbacks line.

To launch the call, the agent must click on one of the available phone numbers.

| < | CALLBAG | CK DETAIL | | | | | | |
|---|---|------------|--|--|--|--|--|--|
| | IDENTITY | NOTES | | | | | | |
| | Activity: YourSociety | | | | | | | |
| | Identity: Alice O'Neill | | | | | | | |
| | Request to call: 2016-08-01 / Toute la journée 09:00:00-17:00:00) Description: | | | | | | | |
| | Numbers to call: 0587963214 | 0789654123 | | | | | | |
| | BA | ЛСК | | | | | | |

Once the callback is launched, the status can be changed and a comment can be added.

If you set 'To reschedule' as status, the callback can be rescheduled at a later time and another period:

Other statuses are available to be set and will close callback once saved :

- Answered if caller accepted the call
- *NoAnswer* if caller were unreachable
- Fax if callback has been resolved thanks to a Fax message
- Handled by mail if callback has been resolved thanks to an E-mail

Clicking on the calendar icon next to the "New due date" field, will popup a calendar to select another callback date.

6.7 Skills-Based Routing

6.7.1 Introduction

Skills-based routing (SBR), or Skills-based call routing, is a call-assignment strategy used in call centres to assign incoming calls to the most suitable agent, instead of simply choosing the next available agent. It is an enhancement to the Automatic Call Distributor (ACD) systems found in most call centres. The need for skills-based routing has arisen, as call centres have become larger and dealt with a wider variety of call types.

-Wikipedia

In this respect, skills-based routing is also based on call distribution to agents through waiting queues, but one or many skills can be assigned to each agent, and call can be distributed to the most suitable agent.

In skills-based routing, you will have to find a way to be able to tag the call for a specific skill need. This can be done for example by entering the call distribution system using different incoming call numbers, using an IVR to let the caller do his own choice, or by requesting to the information system database the customer profile.

6.7.2 Getting Started

- Create the skills
- Apply the skills to the agents
- Create the skill rule sets
- Assign the skill rule sets using a configuration file
- Apply the skill rule sets to call qualification, i.e. incoming calls by using the preprocess subroutine field

Note that you shouldn't use skill based routing on a queue with queue members of type user because the behaviour is not defined and might change in a future XiVO version.

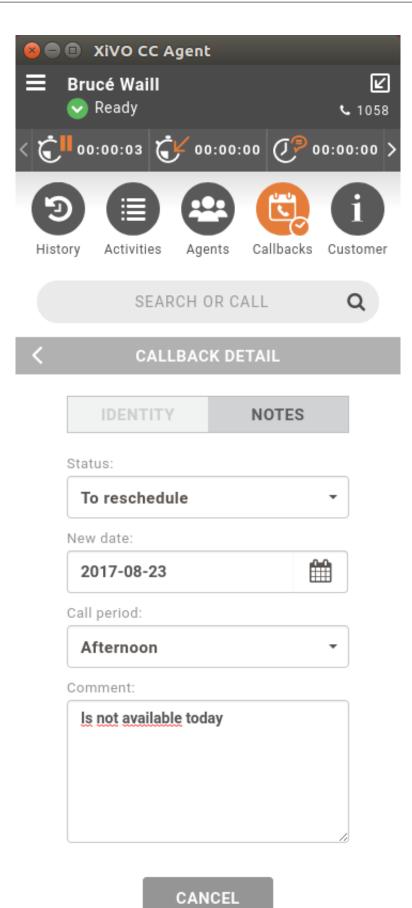

6.7.3 Skills

Skills are created using the menu Services \rightarrow Call center \rightarrow Skills. Each skill belongs to a category. First create the category, and in this category create different skills.

Note that a skill name can't contain upper case letters and must be globally unique (i.e. the same name can't be used in two different categories).

Once all the skills are created you may apply them to agents. Agents may have one or more skills from different categories.

| 8 🗨 | | XiVO | CC A | gent | ŧ | | | | | |

| | | | | |
| SAVE | | | | |

| General Users Queues Queueskills Advanced | | |
|---|--------|--|
| ill. | Weight | |
| english 🔻 | 75 | |
| | | |

It is typical to use a value between 0 and 100 inclusively as the weight of a skill, although any integer is accepted.

6.7.4 Skill Rule Sets

Once skills are created, rule sets can be defined.

A rule set is a list of rules. Here's an example of a rule set containing 2 rules:

- 1. WT < 60, english > 50
- 2. english > 0

The first rule of this rule set can be read as:

If the caller has been waiting for less than 60 seconds (WT < 60), only try to call agents which have the skill "english" set to a value higher than 50; otherwise, go to the next rule.

And the second rule can be read as:

Only try to call agents which have the skill "english" set to a value higher than 0.

Let's examine some simple scenarios, because there's actually some subtilities on how calls are distributed. We will suppose that we have a queue with the default settings and the following members:

- Agent A, with skill english set to 75
- Agent B, with skill english set to 25

Scenario 1

Given:

- Agent A is logged and not in use
- Agent B is logged and not in use
- There is no call in the queue

When a new call enters the queue, then it is distributed to Agent A. As long as Agent A is available and doesn't answer the call, the call will never be distributed to Agent B, even after 60 seconds of waiting time.

When another call enters the queue, then after 60 seconds of waiting time, this call will be distributed to Agent B (and the first call will still be distributed only to Agent A).

The reason is that there's a difference between a call that is being distributed (i.e. that is making agents ring) and a call that is waiting for being distributed. When a call is being distributed to a set of members, no other rule is tried as long as there's at least 1 of these members available.

Scenario 2

Given:

- Agent A is not logged
- Agent B is logged and not in use
- There is no call in the queue

When a new call enters the queue, then it is *immediately* distributed to Agent B.

The reason is that when there's no logged agent matching a rule, the next rule is immediately tried.

Rules

Each rule set is composed of rules, and each rule has two parts, separated by a comma:

- the first part (optional) is the "dynamic part"
- the second part is the "skill part"

Each part contains an expression composed of operators, variables and integer constants.

Operators

The following operators can be used inside rules:

Comparison operators:

- operand1 ! operand2 (is not equal)
- operand1 = operand2 (is equal)
- operand1 > operand2 (is greater than)
- operand1 < operand2 (is lesser than)

Logical operators:

- operand1 & operand2 (both are true)
- operand1 | operand2 (at least one of them are true)

'!' is the operator with the higher priority, and 'l' the one with the lower priority. You can use parentheses '()' to change the priority of operations.

Dynamic Part

The dynamic part can reference the following variables:

- WT
- EWT

The waiting time (WT) is the elapsed time since the call entered the queue. The time the call pass in an IVR or another queue is not taken into account.

The estimated waiting time (EWT) has never fully worked. It is mentioned here only for historical reason. You should not use it. It might be removed in a future XiVO version.

Examples

• WT < 60

Skill Part

The skill part can reference any skills name as variables.

You can also use meta-variables, starting with a '\$', to substitute them with data set on the Queue() call. For example, if you call Queue() with the skill rule set argument equal to:

select_lang(lang=german)

Then every \$lang occurrence will be replaced by 'german'.

Examples

- english > 50
- technic ! 0 & (\$os > 29 & \$lang > 39 | \$os > 39 & \$lang > 19)

| Rules of expertise > Add | | |
|------------------------------|-------------|---|
| Name: | select_lang | |
| | | |
| Rules | | + |
| WT < 10 ,\$ <u>lang</u> > 90 | | ۲ |
| S <u>lang</u> > 40 | | ۲ |
| | | |

Fig. 6.5: Create Skill Rule Sets

Evaluation

Note that the expression:

english | french

is equivalent to:

english ! 0 | french ! 0

Sometimes, a rule references a skill which is not defined for every agent. For example, given the following rule:

english > 0 | english < 1

Then, for an agent which has the skill english defined, the result of this expression is always true. For an agent which does not have the skill english defined, the result of this expression is always false.

Said differently, an agent without a skill X is not the same as an agent with the skill X set to the value 0.

Technically, this is what is happening when evaluating the rule "english > 0" for an agent without the skill english:

```
english > 0
= <Substituing english with the agent value>
"undefined" > 0
= <A comparison with "undefined" in at least one operand yields undefined>
"undefined"
= <In a boolean context, "undefined" is equal to false>
false
```

This behaviour applies to every comparison operators.

Also, the syntax that is currently accepted for comparison is always of the form:

variable cmp_op constant

Where "variable" is a variable name, "cmp_op" is a comparison operator and "constant" is an integer constant. This means the following expressions are not accepted:

- 10 < english (but english > 10 is accepted)
- english < french (the second operand must be a constant)
- 10 < 11 (the first operand must be a variable name)

6.7.5 Apply Skill Rule Sets

A skill rule set is attached to a call using a bit of dialplan. This dialplan is stored in a configuration file you may edit using menu Services \rightarrow IPBX \rightarrow Configuration Files.

In the figure above, 3 different languages are selected using three different subroutines.

Configuration files > Edit | skills.conf

File content

```
[skill_english]
exten=s,1,Set(XIVO_QUEUESKILLRULESET=select_lang(lang=english))
same= ,n,Return()
```

[skill_german] exten=s,1,Set(XIVO_QUEUESKILLRULESET=select_lang(lang=german)) same= ,n,Return()

```
[skill_french]
exten=s,1,Set(XIVO_QUEUESKILLRULESET=select_lang(lang=french))
same= ,n,Return()
```

Fig. 6.6: Use Rule Set In Dialplan

Each of this different selections of subroutines can be applied to the call qualifying object. In the following example language selection is applied to incoming calls.

Example

Configuration file for simple skill selection :

```
[simple_skill_english]
exten = s,1,Set(XIVO_QUEUESKILLRULESET=english_rule_set)
same = n,Return()
[simple_skill_french]
exten = s,1,Set(XIVO_QUEUESKILLRULESET=french_rule_set)
same = n,Return()
```

6.7.6 Monitoring

You may monitor your waiting calls with skills using the asterisk CLI and the command queue show <queue_name>:

```
xivo-jylebleu*CLI> queue show services
services has 1 calls (max unlimited) in 'ringall' strategy (0s holdtime, 2s_
→talktime), W:0, C:1, A:10, SL:0.0% within 0s
Members:
Agent/2000 (Not in use) (skills: agent-1) has taken no calls yet
Agent/2001 (Unavailable) (skills: agent-4) has taken no calls yet
Virtual queue english:
Virtual queue french:
1. SIP/jyl-dev-assur-00000017 (wait: 0:05, prio: 0)
Callers:
```

You may monitor your skills groups with the command queue show skills groups <agent_name>:

You may monitor your skills rules with the command queue show skills rules <rule_name>:

| Incoming ca | alls > Edit 73500 | 0 (from-extern) | |
|-------------|---------------------|--|--|
| General | Call permissions | Schedules | |
| | | DID: Context: Destination : Redirect to : Ring time : CallerID mode : | 73500 Appels entrants (from-extern) Queue ▶ blue (3500@loadtest) |
| | Preproc | ess subroutine : (Description : | skill_english |

Fig. 6.7: Apply Rule Set to Incoming Call

```
xivo-jylebleu*CLI> queue show skills rules <PRESS TAB>
english french select_lang
xivo-jylebleu*CLI> queue show skills rules english
Skill rules 'english':
   => english>90
```

6.8 Reporting and statistics

6.8.1 Introduction

Pack reporting is a part of the XivoCC. It aims at computing historical statistics, which are stored in the **xivo_stats** database. Sample reports based on them are accessible in **SpagoBI**.

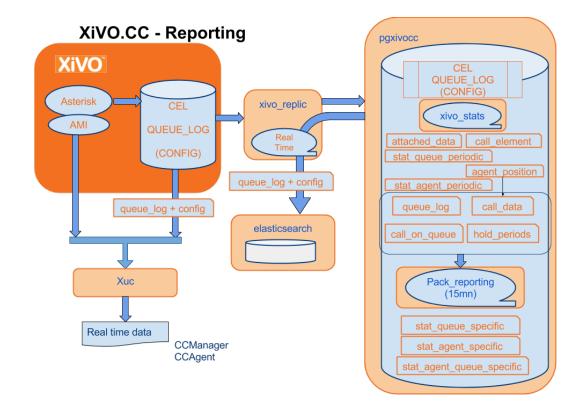

6.8.2 Known limitations

- Queue members should only be agents. If users are members of a queue, their statistics will be incomplete.
- Configuration modifications on the XiVO (such as an agent deletion) are replicated on the statistics server, and their previous value is not kept. However, statistics history is preserved.
- POPC statistics are not accurate.
- Calls longer than 4 hours are considered as unterminated calls and therefore communication time is set to 0 for these calls.
- If two agents are associated to the same call, they will have the same hold time for this call.

- Transfer statistics limitation : given two queues Q1 and Q2, two agents A1 and A2, and an external caller C.
 - C calls Q1 and A1 answers
 - A1 transfers to Q2 and A2 answers
 - A2 transfers to the outside

Then the second transfer is seen as a transfer to the outside.

6.8.3 Reporting Architecture

6.8.4 Attached Data

The pack reporting allows to attach as much data as wished to a given call, in order to find them in the reporting database for future use. This data must be in the form of a set of key-value pairs.

To attach data to a call, you must use the dialplan's **CELGenUserEvent** application:

```
exten = s,n,CELGenUserEvent(ATTACHED_DATA,my_key=my_value)
```

This will insert the following tuple in the **attached_data** table:

| key | value |
|--------|----------|
| my_key | my_value |

6.8.5 Using SpagoBi

Important: All report samples bundled with XiVOCC are aimed to work with french date format. By default dates are picked in french format (day/month/year). Either you need to type them explicitly in your locale format either you can set Locale to french thanks to Flag menu in Spago. See #1662

Scheduling reports

Due to a SpagoBi limitation, when scheduling reports using string parameters, you need to enter manualy the parameter using comma and quotes to separate values. Example for queues support, technical and sales, the parameters of the schedulers must be filled as follow:

```
'support','technical','sales'
```

You may use Jaspersoft® Studio to design you own reports.

Warning: Due to a limitation in SpagoBi do not use single quotes in your reports name, otherwise you will not be able to schedule your report (see #213).

6.8.6 Using Kibana

Kibana is a web tool used to compute statistics based on Elasticsearch content. The reports packaged with the Pack reporting give you an outline of your recent call center activity. Here is a Kibana sample panel:

Graphs are based on the queue_log table, enriched with agent names and agent groups, and inserted into an Elasticsearch index. It contains avents about calls placed on queues, and events about agent presences.

For each entry in the queue_log index, the following attributes are available:

- queudis'downloads page playname : Queue display name
- data1: basic queue_log data, with a different meaning according to the event
- callid : Call unique identifier, generated by Asterisk
- event : Call or agent status event please see below
- agentnumber: Agent number
- queuename : Technical queue name
- groupname : Agent group name

- queuetime: Time of the event
- agentname : Name of the agent, if available

The event can be one of the following (for a detailed explanation, please refer to https://wiki.asterisk.org/wiki/display/AST/Queue+Logs):

- Call events:
 - FULL
 - CONNECT
 - EXITEMPTY
 - CLOSED
 - EXITWITHTIMEOUT
 - JOINEMPTY
 - ABANDON
 - ENTERQUEUE
 - TRANSFER
 - COMPLETEAGENT
 - COMPLETECALLER
 - RINGNOANSWER
- Agent or queue event:
 - ADDMEMBER
 - PAUSEALL
 - PAUSE
 - WRAPUPSTART
 - UNPAUSE
 - UNPAUSEALL
 - PENALTY
 - CONFIGRELOAD
 - AGENTCALLBACKLOGIN
 - AGENTCALLBACKLOGOFF
 - REMOVEMEMBER
 - PRESENCE
 - QUEUESTART

6.8.7 Database schema

Glossary

uniqueId :

- unqiueId are Ids generated by asterisk for each call leg.
- When A calls B we get a call leg for A and one for B, each one is a separate uniqueId.
- in cel asterisk table you can find all event linked to a call leg by looking for it in the column uniqueId.

linkedId :

- the column *linkedId* in *cel* Asterisk table contains a uniqueId which links the two legs of the call.
- The leg which initiates the call (A leg) will have the same value for both *uniqueId* and *linkedId* columns.
- The other leg (**B** leg) will have the uniqueId of **B** in *uniqueId* column and will have the uniqueId of **A** in *linkedId* one.

call_data

Each line in *call_data*, correspond to a unique call and contains only one uniqueId of one call leg. This table is aggregated in near real time with the data of *cel* Asterisk table.

| Column | Туре | Description | |

| ring_duration_INff_EansweRing time of the endpoint answering the call, in seconds | | | |
| | GER | | |
| transfered | BOOLEA | Nrue if the call has been transfered | |
| call_directio | ncall_direc | tiGalltyipection (''incoming": call from the outside, received by XiVO; ''outgoing": | |
| | | call to the outside, originated by an endpoint associated to XiVO ; "internal" : call | |
| | | taking place entirely inside the XiVO) | |
| src_num | VAR- | Calling number | |
| | CHAR | | |
| trans- | call_direc | tilmditapes the transfer direction, if relevant | |
| fer_direction | | | |
| src_agent | VAR- | Agent originating the call | |
| | CHAR | | |
| dst_agent | VAR- | Agent receiving the call, if it is a direct call on an agent. Not filled when the call is | |
| | CHAR | destined to a queue | |
| src_interface | | Interface originating the call (in the Asterisk sense, ex : SCCP/01234) | |
| | CHAR | | |

attached_data

Data attached to the call (cf. Attached Data)

| Column | Туре | Description |
|--------------|---------|--|
| id | INTEGER | |
| id_call_data | INTEGER | Id of the associated tuple in <i>call_data</i> |
| key | VARCHAR | Name of the attached data |
| value | VARCHAR | Value of the attached data |

call_element

Part of a call matching the reaching of an endpoint

| Column | Туре | Description |
|--------------|-----------|--|
| id | INTEGER | |
| call_data_id | INTEGER | Id of the associated tuple in <i>call_data</i> |
| start_time | TIMESTAMP | Time at which the endpoint was called |
| answer_time | TIMESTAMP | Answer time for the endpoint |
| end_time | TIMESTAMP | End time of this call part |
| interface | VARCHAR | Endpoint interface |

call_on_queue

Calls on a queue

| Col- | Type | Description |
|---------|---|---|
| umn | .,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,, | |
| id | IN- | |
| | TE- | |
| | GER | |
| cal- | VAR | Call unique reference, generated by Asterisk |
| lid | CHA | R |
| queue | _fTiftAI | ESFime of entrance in the queue |
| | TAM | |
| to- | IN- | Total ring time, in seconds (includes ringing of non-answered calls) |
| tal_rir | ig <u>T</u> ₩ecc | nds |
| | GER | |
| an- | | SAnswer time |
| | tiff a M | |
| hangu | - I | SHangup time |
| | TAM | _ |
| sta- | call_e | exclallyptatus (full: full queue; closed: closed queue; joinempty: call arrived on empty queue; |
| tus | | <i>leaveempty</i> : exit when queue becomes empty; <i>divert_ca_ratio</i> : call redirected because the ratio |
| | | waiting calls/agents was exceeded ; <i>divert_waittime</i> : call redirected because estimated waiting |
| | | time was exceeded; answered: call answered ; abandoned: call abandoned; timeout : maximum |
| | | waiting time exceeded) |
| queue | | Technical queue name |
| | CHA | |
| agent | | Number of the agent taking the call, if relevant |
| | CHA | R |

hold_periods

Hold periods

| Column | Туре | Description |
|----------|-----------|--|
| id | INTEGER | |
| linkedid | VARCHAR | Call unique reference, generated by Asterisk |
| start | TIMESTAMP | Hold start time |
| end | TIMESTAMP | Hold end time |

stat_queue_periodic

Statistics aggregated by queue and time interval (15 minutes)

| Column | Туре | Description |
|-------------------|--------|---|
| id | INTE- | |
| | GER | |
| time | TIMES- | Start time of the considered interval |
| | TAMP | |
| queue | VAR- | Queue technical name |
| | CHAR | |
| answered | INTE- | Number of answered calls |
| | GER | |
| abandoned | INTE- | Number of abandoned calls |
| | GER | |
| total | INTE- | Total number of calls received on the queue (which excludes the calls dissuaded |
| | GER | before entering the queue) |
| full | INTE- | Number of calls arrived on a full queue (diversion before entering the queue) |
| | GER | |
| closed | INTE- | Number of calls arrived on a closed queue, outside of the configured schedules |
| | GER | (diversion before entering the queue) |
| joinempty | INTE- | Number of calls arrived on an empty queue (diversion before entering the queue) |
| | GER | |
| leaveempty | INTE- | Number of calls redirected because of a queue becoming empty |
| | GER | |
| di- | INTE- | Number of calls arrived when the calls / available agents ratio is exceeded (diver- |
| vert_ca_ratio GER | | sion before entering the queue) |
| di- | INTE- | Number of calls arrived when the estimated waiting time is exceeded (diversion |
| vert_waittime GER | | before entering the queue) |
| timeout | INTE- | Nombre of calls redirecting because maximum waiting time is exceeded |
| | GER | |

stat_agent_periodic

Statistics aggregated by agent and time interval (15 minutes)

| Column | Туре | Description |
|-------------|-----------|---------------------------------------|
| id | INTEGER | |
| time | TIMESTAMP | Start time of the considered interval |
| agent | VARCHAR | Agent number |
| login_time | INTERVAL | Login time |
| pause_time | INTERVAL | Pause time |
| wrapup_time | INTERVAL | Wrap-up time |

stat_queue_specific

Statistics aggregated by queue, called number and time interval (15 minutes)

| Column | Туре | Description | |
|---------------------|-----------|---|--|
| time | TIMESTAMP | Start time of the considered interval | |
| queue_ref | VARCHAR | Technical name of the queue | |
| dst_num | VARCHAR | Called number | |
| nb_offered | INTEGER | Number of presented calls | |
| nb_abandoned | INTEGER | Number of abandoned calls | |
| sum_resp_delay | INTEGER | Wait time, in seconds | |
| answer_less_t1 | INTEGER | Number of calls answered in less than t1 seconds | |
| abandoned_btw_t1_t2 | INTEGER | Number of calls abandoned between t1 and t2 seconds | |
| answer_btw_t1_t2 | INTEGER | Number of calls answered between t1 and t2 seconds | |
| abandoned_more_t2 | INTEGER | Number of calls answered in more than t2 seconds | |
| communication_time | INTEGER | Total communication time in seconds | |
| hold_time | INTEGER | Total hold time in seconds | |
| wrapup_time | INTEGER | Total wrap-up time in seconds | |

The thresholds t1 and t2 are configurable:

- in the table queue_specific_time_period for the default values in seconds. Installation values are t1=15 seconds and t2=20 seconds. Data is saved in the form of (*name, seconds*) pairs, for example : ('t1', 15).
- in the table queue_threshold_time for values specific to a queue. Data is saved in the form of a tuple (queue name, t1, t2).

stat_agent_specific

Statistics aggregated by agent and time interval (15 minutes)

| Column | Туре | Description |
|-----------------------------------|---------|---|
| time | TIMES- | Start time of the considered interval |
| | TAMP | |
| agent_num | VAR- | Agent number |
| | CHAR | |
| nb_offered | INTEGER | Number of calls presented from a queue |
| nb_answered | INTEGER | Number of calls answered from a queue |
| conversation_time | INTEGER | Conversation time on incoming calls from a queue, in sec- |
| | | onds |
| ringing_time | INTEGER | Ringing time on incoming cals from a queue, in seconds |
| nb_outgoing_calls | INTEGER | Number of calls emitted to the outside |
| conversa- | INTEGER | Conversation time in calls emitted to the outside, in seconds |
| tion_time_outgoing_calls | | |
| hold_time | INTEGER | Hold time for calls from a queue, in seconds |
| nb_received_internal_calls | INTEGER | Number of received internal calls |
| conversa- | INTEGER | Conversation time on received internal calls, in seconds |
| tion_time_received_internal_calls | | |
| nb_transfered_intern | INTEGER | Number of calls coming from a queue and transfered to an |
| | | internal destination |
| nb_transfered_extern | INTEGER | Number of calls coming from a queue and transfered to an |
| | | external destination |
| nb_emitted_internal_calls | INTEGER | Number of emitted internal calls |
| conversa- | INTEGER | Conversation time on emitted internal calls, in seconds |
| tion_time_emitted_internal_calls | | |
| nb_incoming_calls | INTEGER | Number of received incoming calls |
| conversa- | INTEGER | Conversation time on received incoming calls, in seconds |
| tion_time_incoming_calls | | |

stat_agent_queue_specific

| Column | Туре | Description |
|--------------------|-----------|---------------------------------------|
| time | TIMESTAMP | Start time of the considered interval |
| agent_num | VARCHAR | Agent number |
| queue_ref | VARCHAR | Technical name of the queue |
| dst_num | VARCHAR | Called number |
| nb_answered_calls | INTEGER | Number of answered calls |
| communication_time | INTEGER | Communication time, in seconds |
| hold_time | INTEGER | Hold time, in seconds |
| wrapup_time | INTEGER | Wrap-up time, in seconds |

Statistics aggregated by queue, called number, agent and time interval (15 minutes)

agentfeatures

Gather information about agent profile

| Column | Туре | Description |
|-----------|---------|-----------------------------|
| id | INTEGER | |
| numgroup | INTEGER | Agent group number |
| number | VARCHAR | Agent number (line number) |
| firstname | VARCHAR | Agent first name |
| lastname | VARCHAR | Agent last name |

agent_position

Line number used by agents

| Column | Туре | Description |
|------------|-----------|--------------------------------|
| agent_num | VARCHAR | Agent number |
| line_num | VARCHAR | Line number of the device used |
| start_time | TIMESTAMP | Begin date of line use |
| end_time | TIMESTAMP | End date of line use |
| sda | VARCHAR | Line direct inward dial |

6.8.8 Sample SQL statistic queries

This section describes some SQL query achievements done based on Database schema.

List all received agent calls

This query get the phone set number on which the agent took the call. It lists all calls answered by agent with line number on which he was logged in. The query here is limiting to all calls answered the first day of August, but it can be easily customized to your needs.

```
1
2
3
4
5
6
```

7

```
SELECT cq.answer_time,
    cq.hangup_time,
    COALESCE(af.firstname, '') || ' ' || COALESCE(af.lastname, '') AS agent_
    oname,
        cd.src_num AS caller,
        ap.line_number AS line_number
FROM call_on_queue cq
LEFT JOIN call_data cd ON cq.callid = cd.uniqueid
```

AND cq.agent_num IS NOT NULL;

This query will result to something like:

| Answer time | Hangup time | Agent | Caller num- | Line number |
|-----------------------|------------------------|---------|-------------|-------------|
| | | name | ber | used |
| 2016-08-01 | 2016-08-01 | Agent A | XXXXXXXXXX | 101 |
| 09:01:36.803 | 09:02:38.916 | | | |
| 2016-08-01 09:08:52.8 | 2016-08-01 09:09:31.97 | Agent B | XXXXXXXXXX | 102 |
| 2016-08-01 | 2016-08-01 | Agent A | XXXXXXXXXX | 101 |
| 09:03:43.797 | 09:07:18.452 | | | |
| 2016-08-01 | 2016-08-01 | Agent C | XXXXXXXXXX | 103 |
| 09:09:06.895 | 09:09:56.549 | | | |

Distribution of received call by month and DID

This query aggregates all received call by month and by direct inward dial number.

```
SELECT extract(year from cq.queue_time) as Year,
1
         to_char(cq.queue_time, 'Mon') as Month,
2
         dst_num AS DID,
3
         COUNT (CASE WHEN cq.status IN ('answered', 'abandoned', 'leaveempty',
4
   COUNT (CASE WHEN cq.answer_time IS NOT NULL THEN 1 END) as Answered,
5
         to_char(AVG(CASE WHEN cq.answer_time IS NOT NULL THEN cq.hangup_time - cq.
6
   →answer_time END), 'HH24:MI:SS') as ACT,
         COUNT (CASE WHEN cq.status = 'timeout' THEN 1 END) as Dissuaded,
7
         COUNT (CASE WHEN cq.status = 'abandoned' THEN 1 END) as Hungup,
8
         COUNT (CASE WHEN cq.status = 'closed' THEN 1 END) as Refused,
9
         COUNT(CASE WHEN cq.status = 'abandoned' AND (cd.end_time - cq.queue_time) <
10
   ↔ '15 seconds'::interval THEN 1 END) as Abandoned_T1,
         to_char(SUM(CASE WHEN cq.status = 'answered' THEN
11
              EXTRACT (epoch FROM (cq.answer_time - cq.queue_time)) ELSE 0 END) /
12
              NULLIF (COUNT (CASE WHEN cq.status IN ('answered', 'abandoned',
13
   OR cq.status IS NULL THEN 1 END),0) * INTERVAL '1 second', 'HH24:MI:SS
14
   \rightarrow ') as AWT,
         SUM(CASE WHEN cd.transfered THEN 1 ELSE 0 END) AS Transfered,
15
         ROUND (COUNT (CASE WHEN cq.answer_time IS NOT NULL THEN 1 END) :: numeric /
16
         NULLIF (COUNT (CASE WHEN cq.status IN ('answered', 'abandoned', 'leaveempty',
17
   OR cq.status IS NULL THEN 1 END), 0)::numeric * 100,2) as Accepted_ratio
18
   FROM call_on_queue cq
19
   LEFT JOIN call_data cd ON cq.callid = cd.uniqueid
20
  GROUP BY 1,2,3;
21
```

This query will result to something like:

| Year | Mont | hDID | Pre- | An- | Aver- | Dis- | Hang | jukpe- | Aban- | Average | Trans- | An- |
|------|------|------|--------|---------|----------|-------|------|--------|----------|----------|--------|--------|
| | | | sentee | d swere | dage | suade | d | fused | l donned | Waiting | fered | swered |
| | | | | | Call | | | | | Time | | Rate |
| | | | | | Time | | | | | | | |
| 2016 | Aug | 1101 | 2 | 2 | 00:04:49 | 0 | 0 | 0 | 0 | 00:00:03 | 0 | 100 |
| 2016 | Aug | 1105 | 1 | 1 | 00:03:53 | 0 | 0 | 0 | 0 | 00:00:06 | 0 | 100 |
| 2016 | Aug | 1106 | 331 | 306 | 00:03:11 | 10 | 15 | 38 | 3 | 00:00:17 | 5 | 92.45 |
| 2016 | Aug | 1107 | 8 | 8 | 00:01:55 | 0 | 0 | 12 | 0 | 00:00:18 | 0 | 100 |
| 2016 | Aug | 1114 | 1 | 1 | 00:04:20 | 0 | 0 | 0 | 0 | 00:00:06 | 0 | 100 |
| 2016 | Aug | 1115 | 2 | 2 | 00:01:30 | 0 | 0 | 0 | 0 | 00:00:09 | 0 | 100 |
| 2016 | Aug | 1118 | 53 | 49 | 00:01:20 | 1 | 3 | 2 | 3 | 00:00:17 | 1 | 92.45 |
| 2016 | Aug | 1119 | 3 | 0 | | 2 | 1 | 0 | 0 | 00:00:00 | 0 | 0 |
| 2016 | Aug | 1120 | 1 | 1 | 00:00:51 | 0 | 0 | 0 | 0 | 00:00:42 | 0 | 100 |

Tables join

Tables **call_data**, **call_on_queue** and **hold_periods** can be linked together by doing a join on a column holding the call reference. The columns are the following:

| Table | Reference column | | |
|---------------|------------------|--|--|
| call_data | uniqueid | | |
| call_on_queue | callid | | |
| hold_periods | linkedid | | |

On the other hand, tables **attached_data** and **call_element** contains foreign key referencing the **id** column of **call_data**.

Tables **call_on_queue**, **agentfeatures** and **agent_position** can be linked together by doing a join on a column holding the agent number reference. The columns are the following:

| Table | Reference column |
|----------------|------------------|
| call_on_queue | agent_num |
| agentfeatures | number |
| agent_position | agent_num |

6.9 Reporting

You may use your own reporting tools to be able to produce your own reports provided **you do not use the XiVO server original tables**, but copy the tables to your own data server. You may use the following procedure as a template :

- · Allow remote database access on XiVO
- Create a postgresql account read only on asterisk database
- Create target tables in your database located on the data server
- Copy the statistic table content to your data server

6.9.1 General Architecture

1. The queue_log table of the asterisk database is filled by events from Asterisk and by custom dialplan events

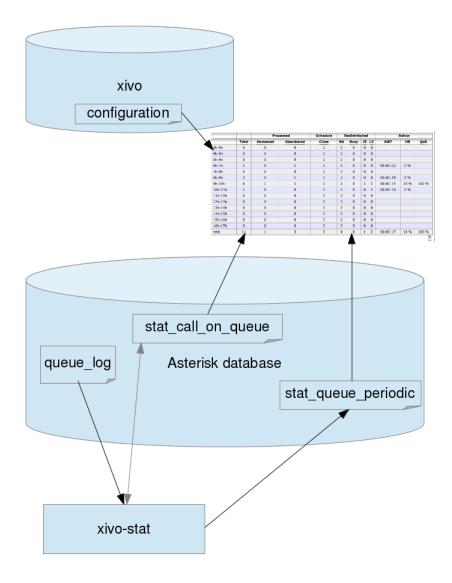

Fig. 6.8: Statistics Architecture

- 2. *xivo-stat fill_db* is then used to read data from the *queue_log* table and generate the tables *stat_call_on_queue* and *stat_queue_periodic*
- 3. The web interface generate tables and graphics from the *stat_call_on_queue* and *stat_queue_periodic* tables depending on the selected configuration

6.9.2 Statistic Data Table Content

stat_call_on_queue

This table is used to store each call individually. Each call received on a queue generates a single entry in this table containing time related fields and a foreign key to the agent who answered the call and another on the queue on which the call was received.

It also contains the status of the call ie. answered, abandoned, full, etc.

| Field | Val- | Description |
|-------|-------|---|
| | ues | |
| id | gen- | |
| | er- | |
| | ated | |
| cal- | nu- | This call id is also used in the CEL table and can be used to get call detail information |
| lid | meric | |
| | value | |
| time | Call | |
| | time | |
| ring- | | Ringing duration time in seconds |
| time | | |
| talk- | | Talk time duration in seconds |
| time | | |
| wait- | | Wait time duration in seconds |
| time | | |
| sta- | | See status description below |
| tus | | |
| queue | e_id | Id of the queue, the name of the queue can be found in table stat_queue, using this name |
| | | queue details can be found in table queuefeatures |
| agent | _id | Id of the agent, the agent name can be found in table stat_agent, using this name agent |
| | | details can be found in table agentfeatures using the number in the second part of the |
| | | <pre>name Exemple : Agent/1002 is agent with number 1002 in table agentfeatures</pre> |

Queue Call Status

| Status | Description |
|----------------|---|
| full | Call was not queued because queue was full, happens when the number of calls is greater than |
| | the maximum number of calls allowed to wait |
| closed | Closed due to the schedule applied to the queue |
| joinempty | No agents were available in the queue to take the call (follows the join empty parameter of the |
| | queue) |
| leaveempty | No agents available while the call was waiting in the qeuue |
| di- | Call diverted because the ratio number of agent number of calls waiting configured was exceeded |
| vert_ca_ration | |
| di- | Call diverted because the maximum expected waiting time configured was exceeded |
| vert_waittim | e |
| answered | Call was answered |
| aban- | Call hangup by the caller |
| doned | |
| timeout | Call stayed longer than the maximum time allowed in queue parameter |

stat_queue_periodic Table

This table is an aggregation of the queue_log table.

This table contains counters on each queue for each given period. The granularity at the time of this writing is an hour and is not configurable. This table is then used to compute statistics for a given range of hours, days, week, month or year.

| Field | Description |
|---------------|--|
| id | Generated id |
| time | time period, all counters are aggregated for an hour |
| answered | Number of answered calls during the period |
| abandoned | Number of abandoned calls during the period |
| total | Total calls received during the period |
| full | Number of calls received when queue was full |
| closed | Number of calls received on close |
| joinempty | Number of calls received no agents available |
| leaveempty | Number of calls diverted agents not available during the wait |
| di- | Number of calls diverted due to the number of agent number versus calls waiting configured |
| vert_ca_ratio | was exceeded |
| di- | Number of calls diverted because the maximum expected waiting time configured was ex- |
| vert_waittime | ceeded |
| timeout | Number of calls diverted because the maximum time allowed in queue parameter was ex- |
| | ceeded |
| queue_id | |

stat_agent

This table is used to match agents to an id that is different from the id in the agent configuration table. This is necessary to avoid loosing statistics on a deleted agent. This also means that if an agent changes number ie. Agent/1001 to Agent/1202, the supervisor will have to take this information into account when viewing the statistics. Affecting an old number to a another agent also means that the supervisor will have to ignore entries for this given agent for the period before the number assignment to the new agent.

stat_queue

This table is used to store queues in a table that is different from the queue configuration table. This is necessary to avoid losing statistics on a deleted queue. Renaming a queue is also not handled at this time.

CHAPTER 7

XiVO Centralized User Management

The XiVO Centralized User Management allows to manage several XiVO servers through a unique web interface. Thanks to this interface, it becomes possible to quickly add users that are automatically routed across servers. This documentation will describe the installation process of the interface, how to use the web interface and the REST API it exposes.

7.1 Intended usage and features

The XiVO Centralized User Management (XCU) is intended for multi-Xivo systems with centralized routing and user management.

Warning: Using XCU for other use-cases than the one described bellow is neither supported nor recommended. If XCU routing schema or centralized user management does not fit your use case, XCU is not good solution for your telephony system. Using XCU for user management only is not recommended. Non-standard installations may be broken by update to future version without warning.

7.1.1 Routing

Routing supports heterogeneous numbering plan administration:

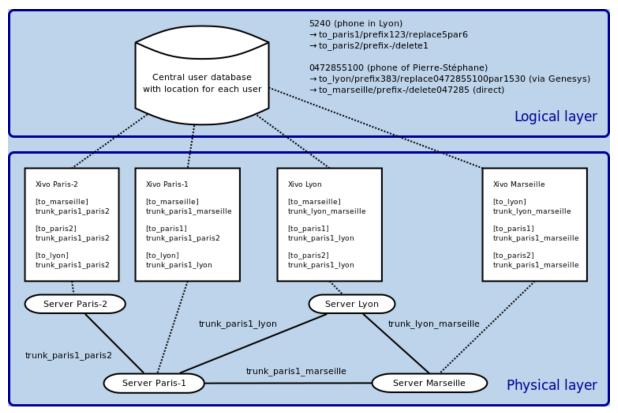

- Centralized dialplan management.
- Route incoming and outgoing calls, independently of the entry point to the target telephony subsystem hosting this number.
- Simple configuration of dialplan richness (prefix, short numbers, numbers of different length, emergency calls, live destination modification).
- Easily configurable protection against routing loops.

Routing is using concept of two layers:

1. "Logical" layer - based on contexts, users are routed using centralized database returning the context to be used to reach the user, with extensions correctly routed irrespective to point of entry of call.

2. "Physical" layer - arbitrary connection (direct or indirect) via trunks is supported. Trunks are associated to contexts to reflect the real network topology, there's no need of full-mesh topology, a call can pass by multiple Xivos before reaching the user.

Mapping between "Logical" and "Physical" layer is done by routing contexts. Every Xivo has routing context for every other Xivo (attached to trunk it will use). Routing context with the same name on different Xivo will be configured accordingly to the position of the Xivo in the network. Intervals can overlap between Xivos, therefore logical structure of dialplan can be independent on physical location of users.

See Configuration of Xivos for Centralized Routing for more configuration details.

Implementation of routing

When there is dial request on some Xivo and destination number is not found locally, AGI script in the dialplan requests a route from the routing database and gets:

- A context used to process the call.
- Rules to update the destination number.
- Requests can be chained.

Note: Routing systems provides also the conversion of the direct incoming number to the user's short number, this conversion is done when the call enters the system, between Xivos only the short number is used. This condition needs to be respected when creating a new system or integrating an existing one. When integrating an existing one, you may need to create some routes manually.

Fault tolerance:

- Local calls work, even when other network links and/or centralized user database are unreachable.
- Routing server can be setup in High Availability master-slave mode. When master routing server is down, routing requests are automatically processed by the slave.

7.1.2 Centralized user management

User management allows centralized administration without knowledge of low-level telephony details:

- Configuration is done from point of view of organization administrator, not telephony technician.
- User creation is simplified by line templates.
- Only relevant choices and options are presented.
- Extension number for new user is checked to be unique among all Xivos.
- Numbers proposed when creating a user are based on their availability, the number not used since the longest time will be reassigned first.
- XCU accounts can be restricted to manage only part of the system.
- All configuration changes are logged for auditability.

Compatibility with configuration via Xivo WebUI:

- Users added by Xivo WebUI before adding Xivo to XCU are imported, but they not reachable by centralized routing.
- Combining user management by XCU and by Xivo WebUI is bad idea, which usually leads to misconfiguration.
- Managing users by XCU and call-center configuration (Queues, Agents) via Xivo WebUI is possible, but queue numbers are not reachable by centralized routing automatically, you need to add manual routes if needed.
- Configuring conference rooms via Xivo WebUI is possible, but conference room numbers are not reachable by centralized routing automatically, you need to add manual routes if needed.

7.1.3 XiVO integration

Both freshly installed XiVO or an already configured XiVO can be added to the user management system. Steps to be followed are:

- When adding a freshly installed XiVO, you need to pass the XiVO Wizard and then follow steps described in *Create XiVO*.
- When adding an already configured XiVO (a XiVO used since a while with users etc.), you follow the same procedure as for a freshly installed XiVO, but you must pay attention to following restrictions:
 - Existing users will be imported in the centralized management, but currently the system doesn't create any route and these users are not reachable automatically, you need to add manually required routes.
 - Existing internal contexts are converted to Entities and created in the management system.
 - Ensure to have considered the interval overlapping option described in the Configuration.

7.2 Installation

7.2.1 Requirements & Limitations

The XiVO Centralized User Management requires :

- A server with:
 - Debian 8
 - PostgreSQL >= 9.5 (see Debian backports or Postgresql Wiki for installing instructions)
 - Docker > 1.12 and corresponding Docker-Compose (see *Install Docker and Docker Compose*). Since version 2018.04 XCU requires Docker-CE instead of Docker Engine (see *Install Docker-CE*).

- git installed
- sudo installed
- Some XiVOs to manage !
 - see the next section for limitations on managed XiVOs.

7.2.2 XiVO(s) Requirements & Limitations

Warning: Please double-check these requirements to prevent unexpected behavior.

For each Xivo which will be added to XCU ensure:

- 1. Create an Incoming calls interval in the *from-exten* context with a did length equal to the internal number length for each interval managed by XCU.
- 2. SCCP devices are not supported an may trigger error in the Centralized User Management. You must remove them on your XiVO before using this application.
- 3. On any context, Users interval *Number range start* and *Number range end* from must be 1-6 six digits (no other characters are allowed).
- 4. If you are making circular inclusions of asterisk context the XCU can potentially load users for a while, you should be **very** careful with such deployment.

Centralized routing will require further configuration - see Configuration of Xivos for Centralized Routing.

7.2.3 Installation by installer package

Install the gcu-installer package via apt:

1. Create the xivo sources list file /etc/apt/sources.list.d/xivo-dist.list and add the following line (replace **VERSION** with the current version, e.g. 2017.11):

deb http://mirror.xivo.solutions/archive/ xivo-VERSION-latest main

2. Add GPG key of XiVO repository:

```
wget http://mirror.xivo.solutions/xivo_current.key -0 - | apt-key add -
```

3. Update your source list and install the package:

```
apt-get update
apt-get install gcu-installer
```

The configuration files are located in /etc/docker.

7.2.4 Configuration

The XCU configuration files are installed by the installer package to the /etc/docker/ directory.

Authentication

Authentication is configured in /etc/docker/interface-centralisee/application.conf, section authentication:

- in authentication.login you can change initial user credentials (default admin / superpass)
- in authentication.ldap you can add configuration to use authentication via LDAP

Interval overlapping

A parameter called *allowIntervalOverlap* with default value *false* is available in /etc/docker/ interface-centralisee/application.conf. When set to *false*, the XCU does not allow use overlapping intervals, when an interval is created or edited the XCU checks whether the interval overlaps with other intervals on all XiVOs and if it does the action is rejected. This default setting helps you to preserve a coherent numbering plan.

If for some reason you need to allow interval overlapping, you just need to change the value in the configuration file to *true* and restart the XCU. It can be useful when some existing XiVO servers with overlapping intervals were imported or when you want to be able to migrate some user to another XiVO without changing its number.

7.2.5 Run the application

Star XCU by following command:

docker-compose -p icdu -f /etc/docker/compose/icdu.yml up -d

Alternatively, you can set a bash alias for conveniently run XCU:

alias dcomp='docker-compose -p icdu -f /etc/docker/compose/icdu.yml'

In that case you can use simpler command :

dcomp up -d

XCU should now be accessible through http://my-server-ip or http://my-server-ip:9001

7.2.6 Application logs

- 1. General application log is in /var/log/interface-centralisee/application.log with daily rotation, historic logs retained for 5 days.
- 2. User actions are logged to /var/log/interface-centralisee/user_actions.log with daily rotation, historic logs retained for 366 days.

By default user_actions.log contains only brief information about which authorize XCU user did what action. To log with more detail (including data of create and update actions), change in /etc/docker/ interface-centralisee/logback.xml line:

```
<logger name="UserActions" level="INFO">
```

into:

```
<logger name="UserActions" level="DEBUG">
```

7.3 Upgrade

The XiVO Centralized User Management (XCU) upgrade.

7.3.1 Prepare sources list

Before upgrading you have to create or change your sources list. It should be located in the file /etc/apt/ sources.list.d/xivo-dist.list.

Set sources list for upgrade to latest version

To upgrade to the latest version the sources list must point towards debian URI and xivo-polaris suite:

```
deb http://mirror.xivo.solutions/debian/ xivo-polaris main
```

Set sources list for upgrade to specific version

To upgrade to a **specific** version the sources list must point towards *archive* URI and *xivo-VERSION-latest* suite. For example if you want to upgrade to **2017.11** version you should have:

deb http://mirror.xivo.solutions/archive/ xivo-2017.11-latest main

Note the /archive/ and -2017.11-latest above.

7.3.2 Upgrade steps

Preparing the upgrade

Read Release Notes starting from your version to the version you target.

Read Version specific XCU upgrade procedures starting from your version to the version you target.

Upgrade

When you have checked the sources.list you can upgrade:

1. Execute with the following commands:

```
apt-get update
apt-get install gcu-installer
```

- 2. If are using postgresql installed using sources from Postgresql Wiki, upgrading gcu-installer may trigger installing new version of PostgreSQL (in parallel to curent one). Suggested action is to disable this new version. If for example GCU use postgresql 9.5 and new version 9.6 was added:
 - stop postgresql 9.6 manually by: service postgresql stop 9.6
 - disable postgresql 9.6 autostart: in /etc/postgresql/9.6/main/start.conf replace auto with disabled
 - ensure postgresql 9.5 is running by: service postgresql start 9.5
- 3. Download the new images:

docker-compose -p icdu -f /etc/docker/compose/icdu.yml pull

4. And run the new container (All XCU services will be restarted):

docker-compose -p icdu -f /etc/docker/compose/icdu.yml up -d

Note: Please, ensure your server date is correct before starting. If system date differs too much from correct date, you may get an authentication error preventing download of the docker images.

7.3.3 Version specific XCU upgrade procedures

Upgrade from versions before 2018.04

Docker-CE must be installed instead of Docker Engine. Follow these manual steps to upgrade it: *Install Docker-CE*.

Upgrade from versions before 2017.06

If you installed GCU version older than 2017.06, you can upgrade it by following *Installation* instructions. Further instructions and notices:

- 1. It is strongly recommended you backup your PostgreSQL icx database and SSH keys before proceeding.
- 2. Installation will install new version of configuration files (like /etc/docker/compose/icdu.yml). If some file already exists with different content, you be prompted to choose correctly version or merge differences. Unless you are sure you need special version, use choice: *install the package maintainer's version*.
- 3. Installation will reuse your SSH certificate stored in /etc/docker/interface-centralisee/ ssh_key if exists.
- 4. Installation will reuse PostgreSQL user icx if exists make sure it has password icx and access to database icx.
- 5. Installation will reuse PostgreSQL database icx if exists.

Check carefully output of apt-get install gcu-installer, you will be informed about each component reused and about any manual checks or actions needed, if necessary.

7.4 Configuration of Xivos for Centralized Routing

When you add Xivo with configuration, basic Xivo configuration is done automatically. However there are still some steps which have to be done manually on each Xivo using Xivo WebUI.

7.4.1 Xivo configuration for centralized routing

Things to verify on Xivo before manual configuration

Verify that:

- 1. Xivo was added to XCU with configuration.
- 2. Xivo was restarted (automatically when added do XCU or manually later).
- 3. You have know routing context name for each xivo in form to_xxx it is configured in XCU when adding Xivo.
- 4. Routing script /usr/share/asterisk/agi-bin/xivo_routage_agi.py is there, executable by asterisk user.
- 5. Dialplan routing configuration /etc/asterisk/extensions_extra.d/routage.conf is there, readable by asterisk user.

Manually update address of routing server

There must be a configuration file $/etc/xivo_routage.conf$ with hosts = IP:9000 where IP is the IP address of XCU server. If you have a backup routing server, there can be multiple IP:PORT couples separated by comma. Example:

[general] hosts = 192.168.111.222:9000,192.168.111.333:9000

Connect Xivos by trunks

Ensure there is (direct or indirect) trunk connection between every two Xivos - see *Interconnect two XiVO directly*. This trunks must have Context set to Incall.

Add routing contexts

In each Xivo create routing contexts for every other Xivo. In Xivo WebUI go to: Services / IPBX / IPBX configuration / Contexts and click Plus icon. For example: if you have three Xivos A, B, C with routing contexts to_xivo_a, to_xivo_b, to_xivo_c, then in Xivo B you create routing contexts to_xivo_a and to_xivo_c. Type of routing context must be Outcall and it must not include any sub-contexts.

Add outgoing calls

For each routing context in every Xivo you need to add Outgoing call. In Xivo WebUI go to: Services / IPBX / Call management / Outgoing calls and click Plus icon. This outgoing call has:

- usually the same name as respective routing context
- · Context set to respective routing context
- Trunk set to trunk connecting (directly or indirectly) to target Xivo
- in Exten tab single line with Exten = X. and Stripnum = 0

7.4.2 Debug centralized routing

On each Xivo you can check log requests and result for routing requests by command:

tail -F /var/log/asterisk/xivo-routage-agi.log

On XCU you can check log requests and result for routing requests by command:

docker logs -f icdu_routing_server_1

To test manually query on routing server (replace IP by XCU's):

curl -v 'http://192.168.32.68:9000/route?digits=1234'

Response is either 200 with body containing route in JSON or 404 with body containing {"Result": "No such element"} if not found.

7.5 Manual installation

Warning: Manual installation steps are provided for debugging purposes and for special cases - for common cases please follow *Installation*.

The configuration files and the Docker-Compose files are available in a specific Git repository.

7.5.1 Database setup

XCU stores some data in a PostgreSQL database. By default, application.conf is configured to connect to a local database named icx with the username icx and password icx. You can change these parameters if you wish. We will use the default parameters in this documentation.

First, we need to install PostgresSQL extensions to use UUID functions :

sudo apt-get install postgresql-contrib

We can now create the user and the database associated :

```
sudo -u postgres psql -c "CREATE USER icx WITH PASSWORD 'icx'"
```

sudo -u postgres psql -c "CREATE DATABASE icx WITH OWNER icx"

We then have to enable UUID extension on the icx database. Connect as root on the icx database :

sudo -u postgres psql icx -c 'CREATE EXTENSION IF NOT EXISTS "uuid-ossp";'

I can't connect to PostgreSQL

It is possible that PostgreSQL complains when you're trying to connect. The solution is to modify the pg_hba. conf (in Debian, located in /etc/postgresql/X.X/main) and add the following line at the end :

local all all trust

7.5.2 Generate SSH key

In order to let XCU communicate with the various XiVOs, an SSH key is used. Generate one using the following command :

ssh-keygen -t rsa -f /etc/docker/interface-centralisee/ssh_key

7.6 Web interface

The XiVO Centralized User Management (XCU) is managed through a web interface. In the following sections, we will highlight the main features of the system.

7.6.1 Definitions

XCU uses a few concepts that are important to understand in order to use the interface correctly.

XiVO The XiVOs servers that are managed by XCU. XCU will automatically retrieve the entities and the users from them and apply the configuration to them.

Entity Entities, also called Contexts, are the parts of the dialplan. Users are attached to them.

Line template Line templates are used to quickly create users : they define a few default options (ringing time, voice mail, etc.) that will be applied to the new user. A line template is required to create a user.

User Actual users that are associated with a phone number

Administrators Users that are able to connect to the XCU and manage the XiVOs.

7.6.2 Dashboard

| 900 V | 🙆 Dashboard | | |

This page allows you to add a new XiVO that will be managed by XCU.

Warning: Before adding XiVO, please make sure it fulfills requirements - see *XiVO(s)* Requirements & *Limitations*.

The first step is to add the displayed SSH key to the authorized keys of your XiVO server. This will allow XCU to connect and configure the XiVO server. You could do this kind of command :

Then, you have to provide the following informations :

- Name : name of the XiVO server that will be displayed in XCU
- Hostname : hostname or IP address of the XiVO server

You then have two options :

• Create the XiVO and configure it now : XCU will save the information, try to connect to the XiVO server and perform the configuration. XiVO services will be unavailable during the operation.

Warning: The configuration takes a while. Relax, go drink a coffee, XCU is doing the legwork for you :)

Note: If you want Xivo to be configured for centralized routing between multiple Xivos, please follow steps described in *Configuration of Xivos for Centralized Routing*.

• Create the XiVO without configuring it : XCU will only save the informations.

View XiVO

| | 1600 | | 2172 | Reating mode * | Not rested + | Internal only | | | | | |
| | 1700 | | 1799 | Reating mode * | | | 012310 | Label | | | |
| | 1600 | | 1899 | Reating mode * | Routed with | unt. direct no | 0123103000 | 0123331099 | Label | 8 | |
| | | | | | | O Add | rango | | | | |
| | | | | | | | | | | | |
| | | | | | | | | | | | |
| 1 | | | | | | | | | | | |

This page allows you to add a new entity to a XiVO. You have to provide the following informations :

- Name : name that will be used by the XiVO server
- Display name : name that will be displayed on XCU
- Caller ID : phone number that will be displayed on outgoing call from this entity

- Intervals : ranges of phone numbers that will be available to this entity. For each one, provide :
 - Start
 - End
 - Routing mode (see bellow)
 - Direct number prefix (only for interval Routed with direct number)
 - First direct number (only for interval Routed with custom direct number)

The system will return an error if the intervals overlap with other entities

Routing mode affects how numbers from given interval are routed via centralized routing:

| Routing mode | centralized routing |
|---------------------------|---|
| Routed | Internal number is used for centralized routing |
| Not routed | Numbers are not routed via centralized routing |
| Routed with direct number | <i>Direct number prefix</i> + internal number is used for centralized routing |
| Routed with custom direct | Users has custom routed numbers in range from First direct number up to the |
| number | width of the interval |

If you have user in interval *Routed with (custom) direct number* on XiVO-A and call him from XiVO-B using his long (external) number:

- 1. target user's long (external) number is translated to short (internal) number by the routing mecanism on the first XiVO (XiVO B in this case)
- 2. on XiVO-A there is an incoming call with short (internal) number of target user

This page allows you to add a new line template. You have to provide the following informations :

- Name : name that will be be displayed on XCU
- **XiVO** : select the XiVOs for which this template will be available

- Entity : select the entities for which this template will be available. *Only entities of the selected XiVOs are displayed*
- SIP peer name : Auto or Model
- Ringing time : number of seconds before incoming call is rejected
- Routed :
 - The text field allows you to provide the SDA prefix to call the phone
 - Uncheck the checkbox if you don't want the phone to be called from the outside
- Outgoing caller id : specify what number is displayed on outgoing call. Possible values are :
 - External number prefix
 - Anonymous
 - Customized : a text field appears to provide the custom number
- Voicemail :
 - Activate voicemail : enable or not the voicemail
 - Voicemail number : specify what number is used to call the voice mail. Possible values are :
 - * Short line number : use the default short number
 - * Customized : a text field appear to provide the custom number
 - Voice to mail : whether or not to send an email when a new message is left, the email is the user's email for short line number box and the one configured in the customized voicemail for the customized box, see *Create user* for details.

This page allows you to add a new user to an entity. You have to provide the following information :

- **Template** : line template to use as a template to create the user. *The main options of the template are displayed below*
- First name
- Last name
- **Internal number** : number that will be used to internally call the user. *Only the available numbers are displayed*
- Email : shown in the directory and used when voice to mail feature is activated
- · Voicemail : Optional, activated only if present in the used template
 - When a private box is choosen (short line number), the box is created and the user's email is obligatory when Voice to mail feature is activated.
 - When a custom voicemail box is used, the interface will create it if the box doesn't exist on XiVO, it will be created with user's email. Otherwise the existing one is used and the email is not changed.
 - Currently there's a limitation due to a XiVO bug when you update a user with associated custom voicemail, the voicemail name is replaced with the user's name.
- CTI credentials : provide a login and a password to allow the user to connect through CTI interfaces

7.6.7 Administrators

List administrators

On the sidebar, Administrators has its own link. This page allows you to :

- Add a new administrator by clicking on the green button
- See all the administrators and perform some operations to them :
 - Edit one by clicking on the yellow button with the wrench icon
 - Delete one by clicking on the red button with the trash icon

Create administrator

This page allows you to add a new administrator. You have to provide the following informations :

- Login : login used by the administrator to connect to XCU
- Name : name that will be displayed on XCU
- LDAP : if checked, the LDAP authentication configured in application.conf will be used
- Password : password used by the administrator to connect to XCU. Shown only if LDAP disabled
- **Superadmin** : whether or not this administrator is a super-administrator. Super-administrators can manage everything in XCU
- Entities : select the entities this administrator will be able to manage Shown only if Superadmin disabled

7.7 REST API

The XiVO Centralized User Management (XCU) exposes some REST API that you can use to integrate with your tools.

7.7.1 General form

 $\label{eq:http://protectT1\textdollarmy-server-ip:\rotectT1\textdollarxcuport/api/1.0/\protectT1\textdollarmethod$

withHeaders(("Content-Type", "application/json"))

- \$xcuport : XCU port number (default 9001)
- \$method : See available methods below

7.7.2 Login

A login request is required before subsequent API calls in order to get a session cookie.

POST /api/1.0/login

Payload parameters :

login (String) Login to connect with

password (String) Password corresponding to the login

The server will return a cookie and you will be able to do other API calls. Example with CURL :

7.7.3 XiVO

The following methods allow you to operate on the XiVOs managed by XCU.

List

List all the XiVOs configured on XCU.

GET /api/1.0/xivo

```
{
  "items": [
   {
     "id": 1,
      "uuid": "8f159082-4b25-48b3-afec-1873491a60be",
      "name": "xivo-220",
     "host": "192.168.29.220",
      "remainingSlots": 664
   },
    {
     "id": 2,
      "uuid": "15585b75-1d75-45b1-8678-520d1210ec59",
      "name": "xivo-221",
     "host": "192.168.29.221",
     "remainingSlots": 280
   }
 ]
}
```

Get

Get a XiVO by its id .

GET /api/1.0/xivo/\$id

```
{
   "id": 1,
   "uuid": "8f159082-4b25-48b3-afec-1873491a60be",
   "name": "xivo-220",
   "host": "192.168.29.220",
   "remainingSlots": 664
}
```

Create

Create a new XiVO.

POST /api/1.0/xivo

Payload parameters :

name (String) Display name of the XiVO

- host (String) Hostname or IP address of the XiVO
- **configure** (Boolean) If set to true, XCI will immediately make the necessary configurations on the XiVO. If set to false, it will only be added to XCI but not configured.

Synchronize configuration files

GET /api/1.0/xivo/synchronize_config_files

7.7.4 Entities

The following methods allow you to operate on the entities made available by the XiVOS.

List

List all the entities available.

GET /api/1.0/entities

```
{
  "items": [
   {
     "id": 17,
      "combinedId": "default@15585b75-1d75-45b1-8678-520d1210ec59",
      "name": "default",
     "displayName": "default",
     "xivo": {
       "id": 2,
        "uuid": "15585b75-1d75-45b1-8678-520d1210ec59",
        "name": "xivo-221",
        "host": "192.168.29.221",
        "remainingSlots": 280
     },
     "intervals": [
       {
         "start": "1700",
          "end": "1799"
        },
        {
          "start": "1961",
          "end": ""
       },
        {
          "start": "2600",
          "end": "2799"
       }
      ],
      "presentedNumber": "inbNo"
   },
    {
     "id": 22,
     "combinedId": "default_analogique@15585b75-1d75-45b1-8678-520d1210ec59",
     "name": "default_analogique",
     "displayName": "default_analogique",
     "xivo": {
        "id": 2,
       "uuid": "15585b75-1d75-45b1-8678-520d1210ec59",
        "name": "xivo-221",
        "host": "192.168.29.221",
        "remainingSlots": 280
     },
      "intervals": [
        {
          "start": "3990000",
          "end": "3999999"
        },
        {
          "start": "39990000",
          "end": "39999999"
        }
     ],
```

```
"presentedNumber": "inbNo"
}
```

Get

}

Get an entity by its combinedId.

GET /api/1.0/entities/\$combinedId

```
"id": 22,
 "combinedId": "default_analogique@15585b75-1d75-45b1-8678-520d1210ec59",
 "name": "default_analogique",
 "displayName": "default_analogique",
 "xivo": {
   "id": 2,
   "uuid": "15585b75-1d75-45b1-8678-520d1210ec59",
   "name": "xivo-221",
   "host": "192.168.29.221",
   "remainingSlots": 280
 },
 "intervals": [
   {
     "start": "3990000",
      "end": "3999999"
   },
   {
     "start": "39990000",
      "end": "39999999"
   }
 ],
 "presentedNumber": "inbNo"
ļ
```

Create

Create a new entity.

POST /api/1.0/entities

Payload parameters :

name (String) Name of the entity

displayName (String) Displayed name of the entity

xivold (Integer) Id of the XiVO the entity will be attached to

intervals (Array) Intervals of numbers this entity will support

start (String) Starting number of the interval

end (String) Ending number of the interval

presentedNumber (String) Number to show on outgoing calls

Delete

Delete an entity.

DELETE /api/1.0/entities/\$combinedId

Edit

Edit an entity. See Create entity for fields details.

PUT /api/1.0/entities/\$combinedId

List users

List users attached to an entity.

GET /api/1.0/entities/\$combinedId/users

```
{
 "items": [
   {
      "id": 559,
      "entity": {
       "id": 22,
        "combinedId": "default_analogique@15585b75-1d75-45b1-8678-520d1210ec59",
        "name": "default_analogique",
        "displayName": "default_analogique",
        "xivo": {
          "id": 2,
          "uuid": "15585b75-1d75-45b1-8678-520d1210ec59",
          "name": "xivo-221",
          "host": "192.168.29.221",
          "remainingSlots": 280
        },
        "intervals": [
          {
            "start": "3990000",
            "end": "3999999"
          },
          {
            "start": "39990000",
            "end": "39999999"
          }
        ],
        "presentedNumber": "inbNo"
      },
      "firstName": "Sous sol Logistique",
      "lastName": "CLF 88:40 P3",
      "internalNumber": "6260",
      "externalNumber": "\"Sous sol Logistique CLF 88:40 P3\"",
      "mail": null,
      "ctiLogin": null,
     "ctiPassword": null,
     "provisioningNumber": "114133"
   }
 ]
}
```

List available numbers

List available numbers for an entity

GET /api/1.0/entities/\$combinedId/available_numbers

```
{
   "items": [
        "3990000",
        "3990001",
        "3990002",
        "3990003",
        "3990004"
]
}
```

7.7.5 Users

The following methods allow you to operate on the users made available by the XiVOS.

Get

Get a user by its id.

GET /api/1.0/users/\$id

```
{
  "id": 559,
  "entity": {
   "id": 22,
    "combinedId": "default_analogique@15585b75-1d75-45b1-8678-520d1210ec59",
    "name": "default_analogique",
    "displayName": "default_analogique",
   "xivo": {
     "id": 2,
     "uuid": "15585b75-1d75-45b1-8678-520d1210ec59",
     "name": "xivo-221",
     "host": "192.168.29.221",
     "remainingSlots": 280
    },
    "intervals": [
     {
        "start": "3990000",
        "end": "3999999"
     },
     {
        "start": "39990000",
        "end": "39999999"
     }
    ],
    "presentedNumber": "inbNo"
  },
  "firstName": "Sous sol Logistique",
  "lastName": "CLF 88:40 P3",
  "internalNumber": "6260",
 "externalNumber": null,
 "mail": null,
 "ctiLogin": null,
  "ctiPassword": null,
  "provisioningNumber": "114133"
}
```

Create

Create a new user.

POST /api/1.0/users Payload parameters : entityCId (String) Entity combinedId the user will be attached to templateId (Integer) Line template to apply to the user firstName (String) First name of the user lastName (String) Last name of the user internalNumber (String) Internal phone number of the user ctiLogin (String) Optional CTI login of the user ctiPassword (String) Optional CTI password of the user

Delete

Delete a user.

DELETE /api/1.0/users/\$id

Edit

Edit a user. See Create user for fields details.

PUT /api/1.0/users/\$id

7.7.6 Templates

The following methods allow you to operate on the line templates used to create users.

List

List all the templates available.

GET /api/1.0/templates

```
[
  {
    "id": 1,
    "name": "Modèle 220",
    "peerSipName": "auto",
    "routedInbound": false,
    "callerIdMode": "incomingNo",
    "ringingTime": 30,
    "voiceMailEnabled": false,
    "voiceMailNumberMode": "short_number",
    "xivos": [
      1
    ],
    "entities": [
      "default@8f159082-4b25-48b3-afec-1873491a60be"
    1
  }
]
```

Get

Get a template by its id.

GET /api/1.0/templates/\$id

```
"id": 1,
"name": "Modèle 220",
"peerSipName": "auto",
"routedInbound": false,
"callerIdMode": "incomingNo",
"ringingTime": 30,
"voiceMailEnabled": false,
"voiceMailEnabled": false,
"voiceMailNumberMode": "short_number",
"xivos": [
1
],
"entities": [
"default@8f159082-4b25-48b3-afec-1873491a60be"
]
```

Create

Create a new template.

POST /api/1.0/templates

Payload parameters :

name (String) Name of the template

xivos (Array of Integer) List of XiVOs ids the template will be available to

entities (Array of String) List of entities combinedIds the template will be available to

peerSipName (String) Possible values are auto or model

ringingTime (Integer) Number of seconds before incoming call is rejected

routedInbound (Boolean) Whether or not the phone can be called from the outside

routedInboundPrefix (String) Compulsory if routedInbound is true SDA prefix to call the phone callerIdMode (String)

Option specifying what number is displayed on outgoing call. Possible values are :

- incomingNo : use the SDA prefix
- anonymous : masked call
- custom : a custom number

customCallerId (String) Compulsory if callerIdMode is custom Custom number to display on outgoing call

voiceMailEnabled (Boolean) Whether or not to enable the voice mail

voiceMailNumberMode (Boolean)

Option specifying what number is used to call the voice mail. Possible values are :

- short_number : use the default short number
- custom : a custom number

voiceMailCustomNumber (String) Compulsory if voiceMailNumberMode is custom Custom number to call the voice mail

voiceMailSendEmail (Boolean) Whether or not to send an email when a new message is left

Delete

Delete a template.

DELETE /api/1.0/templates/\$id

Edit

Edit a template. See Create template for fields details.

PUT /api/1.0/templates/\$id

7.7.7 Administrators

The following methods allow you to operate on the administrators of the XCI.

List

List all the administrators present.

GET /api/1.0/administrators

```
{
   "items": [
    {
        "id": 1,
        "login": "admin",
        "name": "",
        "password": "+\/\/rIncoyp\/Ai\/
        →813xSEeSY+P+x4uNle7cHkL6rpPS3ucgr2EAJIqnQbsIpSGwHj",
        "superAdmin": true,
        "ldap": false,
        "entities": [
        ]
    }
]
```

Get

Get an administrator by its id.

GET /api/1.0/administrators/\$id

```
{
  "id": 1,
  "login": "admin",
  "name": "",
  "password": "+\/\/rIncoyp\/Ai\/8l3xSEeSY+P+x4uNle7cHkL6rpPS3ucgr2EAJIqnQbsIpSGwHj

→",
  "superAdmin": true,
  "ldap": false,
  "entities": [
```

] }

Create

Create a new administrator.

POST /api/1.0/administrators

Payload parameters :

login (String) Login of the administrator

name (String) Displayed name of the administrator

ldap (Boolean) Whether or not to use the LDAP authentication configured in application.conf

password (String) Compulsory if ldap is false Password used by the administrator to login

superAdmin (Boolean) Whether or not this administrator is a super-administrator. Super-administrators can manage everything in XCI.

entityIds (Array of Integer) List of entities this administrator has the rights to manage

Delete

Delete an administrator.

DELETE /api/1.0/administrators/\$id

Edit

Edit an administrator. See Create administrator for fields details.

PUT /api/1.0/administrators/\$id

7.7.8 Example (Python 3)

```
#!/usr/bin/env python3
# -*- coding: utf-8 -*-
from urllib.parse import urlencode

print("New user created")
```

CHAPTER 8

User's Guide

End user help and documentation.

8.1 UC Assistant

Note: This section describes the feature of the UC Assistant application. It is available as a web application from your Web Browser. It is also available as a *desktop application* with these additionnal features:

- show integrated popup when receiving call
- get keyboard shortcut to answer/hangup and make call using Select2Call feature
- handle callto: and tel: links

To install the desktop application, see the desktop application installation page.

What is the XiVO UC Assistant ?

The XiVO UC Assistant is a Web application that enables a user to:

- · search contacts and show their presence, phone status
- make calls through physical phone or using WebRTC
- transfer incoming or outgoing calls
- · access voicemail
- enable call forwarding and *Do Not Disturb* (aka DND)
- · show history of calls

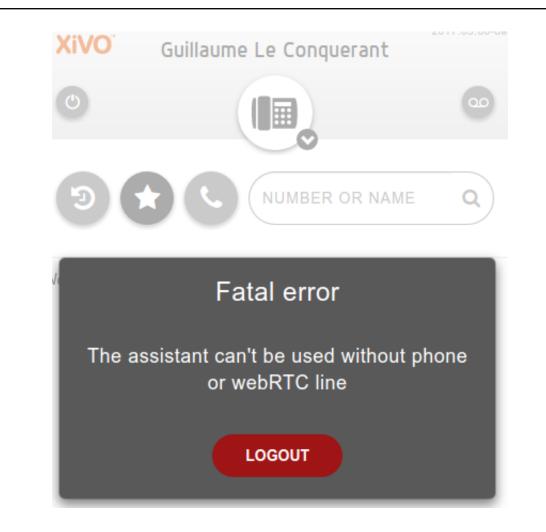

8.1.1 Login

To login, you must have a user configured on the XiVO PBX with:

- XiVO Client enabled,
- Login, password and profile configured

• A configured line with a number

Warning: If a user tries to login without a line, an error message is displayed and user is redirected to the login page (this applies also to *Desktop Applications*)

Note: A **Remember me** option is available at prompt page to keep you signed in, when you want automatic login.

8.1.2 Search

You can use the search section to lookup for people in the company, results will display all information known for the user (phone numbers and email). You can either click on number to call, or click on copy button to put the number in your clipboard to paste it elsewhere.

To enable this feature, you must configure the directories in the XiVO PBX as described in Directories and Views.

Note: Integration note: the UC Assistant support only the display of

- 1 field for name (the one of type *name* in the directory display)
- 3 numbers (the one of type *number* and the first two of type *callable*)
- and 1 email

8.1.3 Forwarding Calls and DND

From UC Assistant you can activate *Do Not Disturb* to block all incoming calls or forward call to any another number just by clicking on action button as seen on following screenshot:

Once you choose an action, you just need to **apply** on clicking on associated button.

Action possibles are :

- Enable DND
- Disable DND
- Edit call forwarding (for both unconditional or on missed call only)

You know that all incoming calls will be rejected once you see the following logo in the header bar :

All calls are forwarded once you see this following one :

Finally, calls are forwarded only if you missed it when you see this one :

Note: If calls are redirected, the forward number will be shown under your name.

Nevertheless, there is a precedence, if DND mode is enabled and also call forwarding, calls will be rejected. If forward on miss call and all call forward are enabled, all calls will be forwarded to number configured for all call

| Cook Cook Cook Cook Cook Cook Cook Cook | ٩) | | | | |

| CANCEL | | | | | |

forwarding.

8.1.4 Favorites

Click on the star to put a contact in its list of favorites. Favorites must be configured in the *XiVO PBX* as described in *Favorites*.

8.1.5 Personal contacts

From top-right hamburger menu, it is possible to display additional actions to handle you personal contacts. You will be able to **create**, **delete all**, **import** and **export** personal contact that you will be either able to search from toolbar or find them in *favorites* panel if starred.

Create a personal contact

Just fill wanted fields (such as name and number), click on star if you want this contact to be displayed in *favorites* panel.

Warning: It is not possible to have twice the same personal contact, at least one field must differ.

It's also possible to create a personal contact from call history by hovering a call item and so have pre-filled fields.

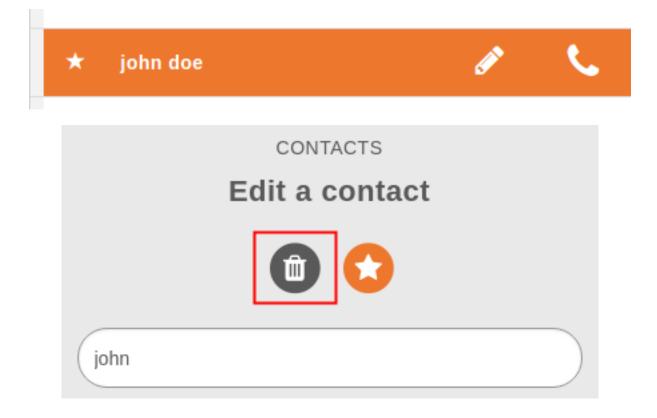

Edit a personal contact

To edit a personal contact, you should search it first, then you just hover it, and a pencil icon should appear as in following screen:

Once clicked, you are redirected to edition pane where you just fill wanted fields.

| XiVO | John Doe | |
|------|----------------------|----|
| ٢ | | 00 |
| | CONTACTS | |
| | Create a new contact | |
| | | |
| | LASTNAME | |
| | FIRSTNAME | |
| | COMPANY | |
| | EMAIL | |
| | NUMBER | |
| | MOBILE | |
| | OTHER NUMBER | |
| | CANCEL | |

Delete a personal contact

To delete a personal contact, you should edit it first, then you just need to click on trashcan icon :

Once clicked, you are invited to confirm or not the deletion of this contact.

Import personal contacts

From menu, you can upload a **.csv** file that contains all the data of your personal contacts. You can either use a file exported from this same interface or create yours.

Here are the list of available attributes of a personal contact:

- company
- email
- fax
- firstname
- lastname
- mobile
- number

As an example here a csv file that can be imported

```
company,email,fax,firstname,lastname,mobile,number
corp,jdoe@company.corp,3333,John,Doe,2222,1111
```

Note: File exported from previous xivo-client is also compatible with UC assistant.

Reverse lookup

By default, *reverse lookup* is enabled for personal contact display on incoming calls. Configuration is set to display firstname and lastname if number or mobile matches an existing personal contact.

8.1.6 Phone integration

The UC Assistant can integrate with the phone to :

- Call / Hangup
- Put on hold
- Do direct or indirect transfers *
- Make a conference *

*) See Known limitations

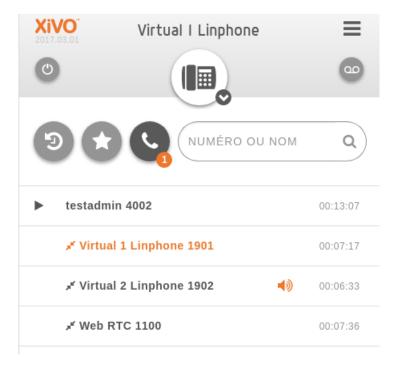

As these features are closely linked to the phone to work, you must check *Supported phones for UC Assistant and CC Agent* and follow the *Required configuration* page.

Once, you're phone is properly configured and you are connected as a user, you know that your using SIP phone once you see the following logo in the header bar :

8.1.7 Conferences

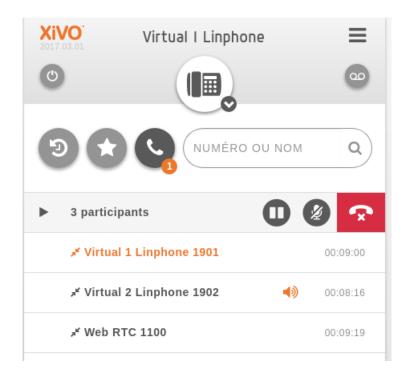

When joining a conference, either as an attendee or an organizer, the UC Assistant will display specific informations about the conference you are joining.

Conference information:

- The timer next to the conference name displays how long the conference has been running
- When hovering, the number of attendee will be displayed

Conference actions:

As an attendee, you can only:

- Exit a conference room by clicking the hangup button
- Put the conference on hold. Other attendees will not hear any hold music but will not be able to hear you neither you will be able to hear the conference room.

As an organizer, you will be able to mute and unmute all other attendee in the conference room.

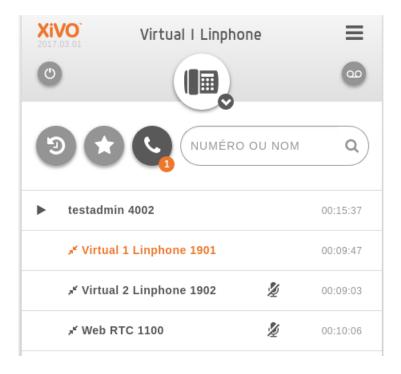

Attendees information:

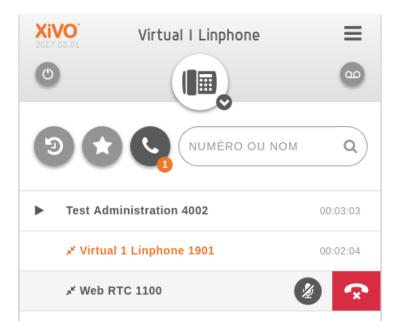

- Attendees name, number and timer are displayed below the conference name.
- Attendees are ordered by name with the exception of the first one which always reflect the current user
- · Conference organizer are displayed in orange
- When an attendee is muted, an slashed microphone icon will be displayed next to its name
- When an attendee is talking, an orange speaker will be displayed next to its name

Attendee action:

When hovering your own user, you can mute and unmute yourself. Organizer can also:

- Mute and unmute any attendee
- Kick out an attendee. A message will be played to the kicked out attendee before leaving the conference.

8.1.8 WebRTC integration

The UC Assistant can be used by users with WebRTC configuration, without physical phone.

For configuration and requirements, see WebRTC Environment.

You know that your using WebRTC once you see the following logo in the header bar :

8.1.9 Experimental video call feature

Note: This experimental feature needs to be enabled in the configuration (see *Experimental video call feature*).

When logged in as a user with a WebRTC line you can initiate and receive an audio/video call. The video call is possible only from your favorite contacts or the directory search result through the video camera icon. When the called user doesn't support video calls, call is established as audio only.

In the current implementation you can put the call on hold, go fullscreen, but for the moment you can have only one video call at a time and you can't transfer the video call. Conference is not supported yet.

*55 (echo test)

To test your microphone and speaker, you may call the echo test application. After a welcome message, the application will echo everything what you speak.

- 1. Dial the *55 number from your Desktop Assistant.
- 2. You should hear the "Echo" announcement.
- 3. After the announcement, you will hear back everything you say. If you hear what you are saying it means that your microphone and speakers are working.
- 4. Press # or hangup to exit the echo test application.

8.2 Desktop Applications

The XiVO Desktop Application is a standalone executable for either UC Assistant or CC Agent Environment. It is available for Windows (64bits) and Linux Debian based distributions (64bits). It offers some additional features compares to the existing web version that can be run in a browser.

8.2.1 Installation

The UC Assistant and CC Agent are available as desktop application through Electron packaging, to be able to use these applications in a standalone executable you need to deploy this container first on client machine.

Windows (64bits)

To download the latest version available on your environment, just open the following url from your computer:

http://<xucmgt_host>:<xucmgt_port>/install/win64

and then start the downloaded program.

Note: If you have a secured installation (using https/wss) the port can be omitted as the default port is already 443, generally speaking use the uc-assistant URL followed by */install/win64*.

Linux (Debian 64bits)

To install the latest version, you need to add a repository linked to the xucmgt host. Edit your /etc/apt/sources.list and add the following line:

deb http://<xucmgt_host>:<xucmgt_port>/updates/debian jessie contrib

Then run

```
sudo apt-get update
sudo apt-get install xivo-desktop-assistant
```

Note: This repository is currently not signed at all.

8.2.2 Configuration

On first launch the application will display the settings page and ask for the application address. Basically it should be the IP address of your XiVO CC/UC applications. If you don't know it, you need to ask your system administrator or refer to *Protocol and connection URL* paragraph.

Navigation

The top menu allows you to navigate either to the application or to the settings page. If you did not enter any setting, the application will redirect you to the settings page.

About

By clicking the ? menu you will open a popup that show you technical information about the application that can be used to report bugs.

Settings

Application Options

- Launch at startup if enabled, the app starts automatically when you log in to your machine.
- Close in tray if enabled, the app stays running in the notification area after app window is closed.

Global keyboard shortcut and Select2Call

This field allow you to define one shortcut in application to handle all basic actions that can be done for managing calls. With one combination keypress you should be able to:

- Call the phone number contained in your clipboard (a.k.a Select2Call)
- Answer a call if phone is ringing
- Hangup if you are already on call

Note:

To be able to **call** someone, you **must** beforehand have copied in your clipboard a phone number from any source (web page, e-mail, text document...)

- Linux: select phone number then trigger *shortcut*
- Windows: select phone number, type Ctrl+C then trigger *shortcut*

Default Select2Call shortcut is Ctrl+Space for Windows and Linux, you can either change it or disable it by leaving the field blank.

Warning: You must be logged in for using global shortcut and automatic dialing to work.

Handling callto: and tel: URLs

The *Desktop Application* can handle telephone number links that appear in web pages. The *Desktop Application* will automatically dial the number when you click on a link.

It is supported on both Windows and Linux Debian based distributions (with a desktop environment compatible with Freedesktop).

Note that this feature may need some manual configuration steps. See Known limitations paragraph.

Protocol and connection URL

In these two fields you need to specify the protocol and address to reach the *XiVO CC* application. The values depend on the Protocol used and the Application you want to reach. The table below list the possible value:

| | | Connection URL | | |
|-------------|--------------|----------------------|---------------------------------|--|
| Protocol | | Secure (recommended) | Non Secure (should not be used) | |
| Application | UC Assistant | XiVOCC_IP | XiVOCC_IP:8070 | |
| | CC Agent | XiVOCC_IP/ccagent | XiVOCC_IP:8070/ccagent | |

Note that XiVOCC_IP or XiVOCC_IP:8070 can be replaced by a FQDN if your administrator has set one.

Update

On Windows, the application will check at startup for a new version of the application and offer to upgrade if one is available.

On Debian, the update relies on the package manager behavior. However you can check for any update by issuing the following commands:

sudo apt-get update
apt-cache policy xivo-desktop-assistant

Startup options

The Desktop Application can be started with following options:

- --ignore-certificate-errors to disable certificate verification, this option is meant **only** for test purposes. You can use it with self-signed certificates.
- -d to enable debug menu items

Note: On Windows the shortcut both options be set must to xivo-desktop-assistant.exe pointing to application located in C:\Users\<USER>\AppData\Local\xivo\xivo-desktop-assistant.exe so that Target of shortcut looks like for example to: C:\Users\IEUser\AppData\Local\xivo\xivo-desktop-assistant. exe --ignore-certificate-errors -d

Known limitations

• *callto:* or *tel:* URLs : click on links using protocol *callto:* or *tel:* on **Windows** doesn't work if any version of *Skype / Lync* is installed on the PC. However **Manual association** can be done as explained here : https://superuser.com/a/1118466

Troubleshoot Application

If you don't succeed to reach login page of desired application (i.e. just give you the possibility to retry or to change parameters) and if you observe some errors about certificate in debug mode, you should

- Check that you installed correctly the certificate under */etc/docker/nginx/ssl* (*Signed SSL/TLS certificate for WebRTC*).
- Take care if your move a *.cer to *.crt. You must concatenate a key file to your *.cer (cat certifcate. cer certificate.key > certificate.crt). Just rename it will not work
- Check that XUC_HOST in */etc/docker/compose/custom.env* is also configured with the same FQDN as in the certificate, not the IP address.

8.2.3 Specific Features

This section lists the specific features per application available with the desktop application.

CC Agent

Resize Window

Once *CC Agent* is launched through standalone application, a new button appears to be able to switch between a vertical minimalist view and default one.

8.3 WebRTC Environment

One can use WebRTC with XiVO PBX and XiVO CC in the following environment:

- LAN network (currently no support for WAN environment),
- with the:
 - UC Assistant or CC Agent with Chrome browser version 57 or later

- or Desktop Application

8.3.1 Requirements

The requirements are:

- to have a microphone and headphones for your PC,
- to configure your *XiVO PBX*:
 - open WebRTC access (see: Configuration of XiVO PBX for WebRTC) taking great care of the security notice,
 - and then create users with a WebRTC line (see: Configuration of user with WebRTC line),
- have a SSL/TLS certificate signed by a certification authority installed on the nginx of XiVO CC (see: Signed SSL/TLS certificate for WebRTC),
- and use *https*:
 - UC Assistant: you must connect to the UC Assistant via https protocol,
 - Desktop Application: you must check Protocol -> Secure in the application parameters.

Note: Currently you can not have a user configured for both WebRTC and a phone set at the same time.

8.3.2 Limitations

Known limitation are :

• Voice may not be able to hear if your computer have more than 4 network interfaces up at the same time (this can happen if you use virtualization)

Note:

To check if you have more than 4 network interfaces you can type following command: ls /sys/class/net

Then just use: ifdown <ifname>

This will switch off network interface not required to make your call.

CHAPTER 9

Devices

In XiVO, there are two kind of devices:

9.1 Officially Supported Devices

The officially supported devices will be supported across upgrades and phone features are guaranteed to be supported on the latest version.

xivo-provd plugins for these devices can be installed from the "officially supported devices" repository.

9.1.1 Supported phones for UC Assistant and CC Agent

| Manufacturer | Function | | | | | |
|--------------------------|----------|--------|------|------------|----------|----------|
| | | | | | Attended | Direct |
| | Answer | Hangup | Hold | Conference | Transfer | Transfer |
| Snom 7XX | OK | OK | OK | OK | OK | OK |
| Polycom VVX | OK | OK | OK | NO | OK | OK |
| Yealink T4XG, T4XP, T4XS | OK | OK | OK | NO | OK | OK |

• NO - Not available

For other type of phone sets, you will not be able to use all the call features from the UC Assistant or the CCAgent.

9.1.2 Aastra

Aastra has been acquired by Mitel in 2014. In XiVO, the 6700 series and 6800 series phones are still referenced as Aastra phones, for historical and compatibility reasons.

Table 9.2 – continued from previous page

Supported expansion modules:

- Aastra® M680 (for Aastra® 6865i/6867i/6869i)
- Aastra® M685 (for Aastra® 6865i/6867i/6869i)

Note: The provisioning server doesn't know if you use a M680 or a M685. Therefore provisioning is done as if you had a M685 (the one with the more keys). See the below correspondency table between key number in Webi (*Function key* tab of user) and expansion module key number. **Note** that this example is given for a 6865 which has 8 programmable keys. Correspondency will change for a 6867 which has 38 softkeys.

| Webi Key Number | M680 Key Numbe | r | M685 Key Number | | |

For best results, activate DHCP Integration on your XiVO.

These devices can be used to connect faxes. For better success with faxes some parameters must be changed. You can read the *Using analog gateways* section.

Note: If you want to manually resynchronize the configuration from the ATA device you should use the following url:

http://ATA_IP/admin/resync?http://XIVO_IP:8667/CONF_FILE

where :

- *ATA_IP* is the IP address of the ATA,
- XIVO_IP is the IP address of your XiVO,
- CONF_FILE is one of spa3102.cfg, spa8000.cfg

Table 0.2 continued from pr

Warning: These phones can only be used in SCCP mode. They are limited to the features supported in XIVO's SCCP implementation.

To install firmware for xivo-cisco-sccp plugins, you need to manually download the firmware files from the Cisco website and save them in the /var/lib/xivo-provd/plugins/\$plugin-name/var/cache directory.

This directory is created by XiVO when you install the plugin (i.e. xivo-cisco-sccp-legacy). If you create the directory manually, the installation will fail.

Warning: Access to Cisco firmware updates requires a Cisco account with sufficient privileges. The account requires paying for the service and remains under the responsibility of the client or partner. Avencall is not responsible for these firmwares and does not offer any updates.

For example, if you have installed the xivo-cisco-sccp-legacy plugin and you want to install the 7940-7960-fw, networklocale and userlocale_fr_FR package, you must:

- Go to http://www.cisco.com
- Click on "Log In" in the top right corner of the page, and then log in
- Click on the "Support" menu
- Click on the "Downloads" tab, then on "Voice & Unified Communications"
- Select "IP Telephony", then "Unified Communications Endpoints", then the model of your phone (in this example, the 7940G)
- Click on "Skinny Client Control Protocol (SCCP) software"
- Choose the same version as the one shown in the plugin
- Download the file with an extension ending in ".zip", which is usually the last file in the list
- In the XiVO web interface, you'll then be able to click on the "install" button for the firmware

The procedure is similar for the network locale and the user locale package, but:

- Instead of clicking on "Skinny Client Control Protocol (SCCP) software", click on "Unified Communications Manager Endpoints Locale Installer"
- · Click on "Linux"
- Choose the same version of the one shown in the plugin
- For the network locale, download the file named "po-locale-combined-network.cop.sgn"
- For the user locale, download the file named "po-locale-\$locale-name.cop.sgn, for example "po-locale-fr_FR.cop.sgn" for the "fr_FR" locale
- Both files must be placed in /var/lib/xivo-provd/plugins/\$plugin-name/var/cache directory. Then install them in the XiVO Web Interface.

Note: Currently user and network locale 11.5.1 should be used for plugins xivo-sccp-legacy and xivo-cisco-sccp-9.4

9.1.4 Mitel

The Mitel 6700 Series and 6800 Series SIP Phones are supported in XiVO. See the Aastra section.

9.1.5 Patton

FXS Gateways

The following analog VoIP gateways are supported:

| | SN4112 | SN4114 | SN4116 | SN4118 | SN4316 | SN4324 | SN4332 |
|--------------|--------|--------|--------|--------|--------|--------|--------|
| Provisioning | Y | Y | Y | Y | Y | Y | Y |
| H-A | Y | Y | Y | Y | Y | Y | Y |

XiVO only supports configuring the FXS ports of these gateways. It does not support configuring the FXO ports. If you have a gateway on which you would like to configure the FXO ports, you'll need to write the FXO ports configuration manually by creating a *custom template* for your gateway.

It's only possible to enter a provisioning code on the first FXS port of a gateway. For example, if you have a gateway with 8 FXS ports, the first port can be configured by dialing a provisioning code from it, but ports 2 to 7 can only be configured via the XiVO web interface. Also, if you dial the *"reset to autoprov" extension* from any port, the configuration of all the ports will be reset, not just the port on which the extension was dialed. These limitations might go away in the future.

BRI Gateway

The following BRI VoIP gateways is supported:

| | SN4120 |
|--------------|--------|
| Provisioning | Y |
| H-A | Y |

To use the gateway you must, after having provisionned the gateway, configure a SIP trunk on the XiVO.

In *Trunk management -> SIP Protocol*, add a new SIP trunk with:

- Tab General:
 - Name: smartnode4120
 - Authentication username: smartnode4120
- Tab *Register*:
 - Register: yes
 - Name: smartnode4120
 - Authentication username: smartnode4120
 - Password: password
 - Remote server: the patton gateway IP address
- Tab Signalling:
 - Monitoring: yes

General notes

These gateways are configured with a few regional parameters (France by default). These parameters are easy to change by writing a *custom template*.

Telnet access and web access are enabled by default. You should change the default password by setting an administrator password via a XiVO "template device".

By downloading and installing the Patton firmwares, you agree to the Patton Electronics Company conditions.

To provision a gateway that was previously configured manually, use the following commands on your gateway (configure mode), replacing XIVO_IP by the IP address of your XiVO server:

```
profile provisioning PF_PROVISIONING_CONFIG
  destination configuration
  location 1 http://XIVO_IP:8667/$(system.mac).cfg
  activation reload graceful
  exit
provisioning execute PF_PROVISIONING_CONFIG
```

9.1.6 Polycom

| | 1 | 1 | 1 | | |
| Paging | NYT | Ν | NYT | | |

Particularities:

- The latest Polycom firmwares can take a lot of time to download and install due to their size (~650 MiB). For this reason, these files are explicitly excluded from the XiVO backups.
- For directed call pickup to work via the BLF function keys, you need to make sure that the option *Set caller-id in dialog-info+xml notify* is enabled on your XiVO. This option is located on the *Services* → *IPBX* → *General settings* → *SIP Protocol* page, in the *Signaling* tab.

 $^{^1}$ These devices are marked as Not Tested because other similar models using the same firmware have been tested instead. If these devices ever present any bugs, they will be troubleshooted by the XiVO support team.

Also, directed call pickup via a BLF function key will not work if the extension number of the supervised user is different from its caller ID number.

- Default password is 9486 (i.e. the word "xivo" on a telephone keypad).
- On the VVX101 and VVX201, to have the two line keys mapped to the same SIP line, create a *custom template* with the following content:

```
{% extends 'base.tpl' -%}
{% block remote_phonebook -%}
{% endblock -%}
{% block model_specific_parameters -%}
reg.1.lineKeys="2"
{% endblock -%}
```

This is especially useful on the VVX101 since it supports a maximum of 1 SIP line and does not support function keys.

Note: (XiVO HA cluster) BLF function key saved on the master node are not available.

Supported expansion modules:

- Polycom® VVX Color Expansion (for Polycom® VVX 300/310/400/410/500/600)
- Polycom® VVX Paper Expansion (for Polycom® VVX 300/310/400/410/500/600)
- Polycom® SoundPoint IP Backlit (for Polycom® SoundPoint 650)

Warning: Polycom® VVX® Camera are not supported.

Table 9.5 – continued from previous page

Supported expansion modules:

- Snom® Vision (for Snom® 7xx series and Snom® 8xx series)
- Snom® D7 (for Snom® 7xx series)

Note: For some models, function keys are shared with line keys

There's the following known limitations/issues with the provisioning of Snom phones in XiVO:

- If you are using Snom phones with HA, you should not assign multiple lines to the same device.
- The Snom D745 has limited space for function key labels: long labels might be split in a suboptimal way.
- When using a D7 expansion module, the function key label will not be shown on the first reboot or resynchronization. You'll need to reboot or resynchronize the phone a second time for the label to be shown properly.
- After a factory reset of a phone, if no language and timezone are set for the "default config device" in XiVO
 → Configuration → Provisioning → Template device, you will be forced to select a default language and
 timezone on the phone UI.

See also the list of *community supported Yealink models*.

Regarding the W52P (DECT), there is firmware for both the base station and the handset. The base and the handset are probably going to work if they are not using the same firmware version, although this does not seem to be officially recommended. By default, a base station will try to upgrade the firmware of an handset over the air (OTA) if the following conditions are met:

- Handset with firmware 26.40.0.15 or later
- Base station with firmware 25.40.0.15 or later
- Handset with hardware 26.0.0.6 or later

Otherwise, you'll have to manually upgrade the handset firmware via USB.

In all cases, you should consult the Yealink documentation on Upgrading W52x Handset Firmware.

Note: Some function keys are shared with line keys

Supported expansion modules:

- Yealink® EXP38 (for Yealink® T26P/T28P)
- Yealink® EXP39 (for Yealink® T26P/T28P)
- Yealink® EXP40 (for Yealink® T46G/T48G T46S/T48S)

Caption :

9.2 Community Supported Devices

The community supported devices are only supported by the community. In other words, maintenance, bug, corrections and features are developed by members of the XiVO community. XiVO does not officially endorse support for these devices.

xivo-provd plugins for these devices can be installed from the "community supported devices" repository.

9.2.1 Aastra

6700i and 9000i series:

| Model | Tested ¹ | Fkeys ² | XiVO HA ³ |
|--------|---------------------|--------------------|----------------------|
| 6730i | No | 8 | Yes |
| 6753i | Yes | 6 | Yes |
| 6757i | Yes | 30 | Yes |
| 9143i | Yes | 7 | Yes |
| 9480i | No | 6 | Yes |
| 9480CT | No | 6 | Yes |

9.2.2 Alcatel-Lucent

IP Touch series:

| Model | Tested ¹ | Fkeys ² | XiVO HA ³ |
|-----------------------|---------------------|--------------------|----------------------|
| 4008 Extended Edition | Yes | 4 | No |
| 4018 Extended Edition | Yes | 4 | No |

Note that you *must not* download the firmware for these phones unless you agree to the fact it comes from a non-official source.

For the plugin to work fully, you need these additional packages:

apt-get install p7zip python-pexpect telnet

 1 Tested means the device has been tested by the XiVO development team and that the developers have access to this device.

² Fkeys is the number of programmable function keys that you can configure from the XiVO web interface. It is not necessarily the same as the number of physical function keys the device has (for example, a 6757i has 12 physical keys but you can configure 30 function keys because of the page system).

³ XiVO HA means the device is confirmed to work with XiVO HA.

9.2.3 Avaya

1200 series IP Deskphones (previously known as Nortel IP Phones):

| Model | Tested ¹ | Fkeys ² | XiVO HA ³ |
|---------|---------------------|--------------------|----------------------|
| 1220 IP | Yes | 0 | No |
| 1230 IP | No | 0 | No |

9.2.4 Cisco

Cisco Small Business SPA300 series:

| Model | Tested ¹ | Fkeys ² | XiVO HA ³ |
|--------|---------------------|--------------------|----------------------|
| SPA301 | No | 1 | No |
| SPA303 | No | 3 | No |

Note: Function keys are shared with line keys for all SPA phones

Cisco Small Business SPA500 series:

| Model | Tested ¹ | Fkeys ² | XiVO HA ³ |
|----------|---------------------|--------------------|----------------------|
| SPA501G | Yes | 8 | No |
| SPA502G | No | 1 | No |
| SPA504G | Yes | 4 | No |
| SPA508G | Yes | 8 | No |
| SPA509G | No | 12 | No |
| SPA512G | No | 1 | No |
| SPA514G | No | 4 | No |
| SPA525G | Yes | 5 | No |
| SPA525G2 | No | 5 | No |

The SPA500 expansion module is supported.

Cisco Small Business IP Phones (previously known as Linksys IP Phones)

| Model | Tested ¹ | Fkeys ² | XiVO HA ³ |
|--------|---------------------|--------------------|----------------------|
| SPA901 | No | 1 | No |
| SPA921 | No | 1 | No |
| SPA922 | No | 1 | No |
| SPA941 | No | 4 | No |
| SPA942 | Yes | 4 | No |
| SPA962 | Yes | 6 | No |

Note: You must install the firmware of each SPA9xx phones you are using since they reboot in loop when they can't find their firmware.

The SPA932 expansion module is supported.

ATAs:

| Model | Tested ¹ | Fkeys ² | XiVO HA ³ |
|---------|---------------------|--------------------|----------------------|
| PAP2 | No | 0 | No |
| SPA2102 | No | 0 | No |
| SPA8800 | No | 0 | No |
| SPA112 | No | 0 | No |

For best results, activate DHCP Integration on your XiVO.

Note: These devices can be used to connect Faxes. For better success with faxes some parameters must be changed. You can read the *Using analog gateways* section.

Note: If you want to manually resynchronize the configuration from the ATA device you should use the following url:

http://ATA_IP/admin/resync?http://XIVO_IP:8667/CONF_FILE

where :

- *ATA_IP* is the IP address of the ATA,
- XIVO_IP is the IP address of your XiVO,
- CONF_FILE is one of spa2102.cfg, spa8000.cfg

| Table 9.7 - | - continued | from | previous page | |
|-------------|-------------|------|---------------|--|
|-------------|-------------|------|---------------|--|

Note: Some function keys are shared with line keys

Particularities:

- For best results, activate *DHCP Integration* on your XiVO.
- Impossible to do directed pickup using a BLF function key.
- Only supports DTMF in RFC2833 mode.
- Does not work reliably with Cisco ESW520 PoE switch. When connected to such a switch, the D40 tends to reboot randomly, and the D70 does not boot at all.
- It's important to not edit the phone configuration via the phones' web interface when using these phones with XiVO.
- Paging doesn't work.

9.2.6 Fanvil

| T23P | No | 3 | — | xivo-yealink-v80 |
| T27P | Yes | 21 | Yes | xivo-yealink-v80 |
| T29G | No | 27 | | xivo-yealink-v80 |
| T49G | Yes | 29 | Yes | xivo-yealink-v80 |

Note: Some function keys are shared with line keys

9.2.14 Zenitel

| Model | Tested ¹ | Fkeys ² | XiVO HA ³ |
|------------|---------------------|--------------------|----------------------|
| IP station | Yes | 1 | No |

The officially supported devices will be supported across upgrades and phone features are guaranteed to be supported on the latest version.

The community supported devices are only supported by the community. In other words, maintenance, bug, corrections and features are developed by members of the XiVO community. XiVO does not officially endorse support for these devices.

The next topics lists the officially and community supported devices. For each vendor, a table shows the various features supported by XiVO. Here's an example:

| | Model X | Model Y | Model Z |
|--------------------------------|-----------------------------|---------|---------|
| Provisioning | Y | Y | Y |
| H-A | Y | Y | Y |
| Directory XIVO | N | Y | Y |
| Funckeys | 0 | 2 | 8 |
| | Supported programmable keys | | |
| User with supervision function | Y | Y | Y |

The rows have the following meaning:

Provisioning Is the device supported by the *auto-provisioning* system ?

H-A Is the device supported by the *high availability* system ?

Directory XiVO Is the device supported by the *remote directory*? In other word, is it possible to consult the XiVO's remote directory from the device?

Funckeys How many function keys can be configured on the device from the XiVO web interface ?

The number of function keys that can be configured on a device is not necessarily the same as the number of physical function keys the device has. For example, an Aastra 6757i has 12 physical keys but you can configure 30 function keys because of the page system.

Inside a table, the following legend is used:

- Y = Yes / Supported
- N = No / Not supported
- NT = Not tested
- NYT = Not yet tested

Each table also contains a section about the supported function keys. In that section, the following legend can also be used:

- FK = Funckey
- SK = SoftKey
- HK = HardKey
- MN = Menu

Function keys work using the extensions in *Services* \rightarrow *Extensions*. It is important to enable the function keys you want to use. Also, the enable transfer option in the user configuration services tab must be enabled to use transfer function keys.

9.3 Plugins release notes

9.3.1 xivo-aastra-3.3.1-SP4-HF9

Note: Replaces xivo-aastra-3.3.1-SP4 plugin

- v1.8 Download links for firmwares update for Aastra/Mitel phones.
- **v1.7** Firmware update for Aastra/Mitel phones. Particularly these new firmwares support forwarding of Multiple Spanning Tree Protocol (MSTP) messages from the LAN port to the PC port. This ensures issues regarding network loops are not created.

9.3.2 xivo-aastra-4.3.0

Note: Replaces xivo-aastra-4.1.0 plugin

- v1.8 Download links for firmwares update for Aastra/Mitel phones.
- **v1.7** Firmware update for Aastra/Mitel phones. Particularly these new firmwares support forwarding of Multiple Spanning Tree Protocol (MSTP) messages from the LAN port to the PC port. This ensures issues regarding network loops are not created.

9.3.3 xivo-patton-6.10

v1.1 Plugin added which provision FXS patton gateways (SN411X and SN43XX)

9.3.4 xivo-patton-SN4120-6.10

- v1.2 Fix plugin installation (install rule for SN4120 firmware was wrong)
- v1.1 Plugin added which provision BRI patton gateway (SN4120)

9.3.5 xivo-polycom-4.0.11

Note: Replaces xivo-polycom-4.0.9 plugin: *this plugin is required* for Polycom devices with MAC address in the range 64167F (instead of 0004F2)

- v2.2 fix URL for Updater file download
- v2.1 DND feature disabled
- v1.9 integrate XiVOCC required template configuration

9.3.6 xivo-polycom-5.4.3

- v2.1 DND feature disabled
- v1.8 integrate XiVOCC required template configuration

9.3.7 xivo-snom-8.7.5.35

- v2.3 Change provisioning of *Login and Pause management using function keys* keys to support Wrapup indication.
- v2.2 Add support to SIP Auto-Answer Header (needed for CTI Transfer in Polaris)
- v2.1 DND feature disabled
- v1.9 update to use the new language pack
- v1.8 correction for provisioning if there is no DST

9.3.8 xivo-snom-8.9.3.60

Note: Replaces xivo-snom-8.9.3.40 plugin

- v2.5 Change parameter to fix Switchboard answer
- v2.4 Change provisioning of *Login and Pause management using function keys* keys to support Wrapup indication.
- v2.3 Add support for D712 and upgrade firmware for 7XX serie.
- v2.2 Add support to SIP Auto-Answer Header (needed for CTI Transfer in Polaris)
- v2.1 DND feature disabled
- v1.8 correction for provisioning if there is no DST

9.3.9 xivo-yealink-v70

v2.1.2 Replace broken firmware link

v2.1 DND feature disabled

9.3.10 xivo-yealink-v72

v2.1 DND feature disabled

9.3.11 xivo-yealink-v73

v2.1 DND feature disabled

9.3.12 xivo-yealink-v81

Note: Replaces xivo-yealink-v80 plugin

v2.3 switch to default Yealink french translation to fix duplicate label for T48X

Note: It leads to several small differences in the labels, for example:

- Attente is changed to Mtr Att
- Journal is changed to Historique
- Annuaire is changed to Répertoires

- v2.2 add support to expansion module EXP40 for T46/T48 S
- v2.1 new version of Yealink plugin with support for T4XS family and T23G

Warning: To install firmware for T4XS family, the 'unrar' executable must be present on the host system. If it is not, you'll have a runtime error while trying to install any firmware.

Starting from Five.08 and 2017.08 unrar-free and unar will be installed as a dependency of xivo-fetchfw package.

Otherwise you need to install them manually :

```
apt-get update
apt-get install unrar-free unar
```

Some older versions of unrar-free fail to decompress the firmware package. In that case you will need to enable non-free packages in debian and install unrar-nonfree :

```
apt-get update
apt-get install unrar
```

CHAPTER 10

API and SDK

10.1 Unified Communication Framework

This framework is mainly provided by the xuc server. It provides

- Javascript API
- Rest Web services
- Sample application
- Real Time Statistics

10.1.1 Web Socket API

The xivo solutions web socket API enables you to integrate enterprise communication functions to your business application. It exposes Cti functions using javascript methods calls and web socket events.

You may add your own handlers for your application to react to telephony / contact center events.

This API is using websockets, and therefore needs a modern browser supporting them (firefox, chrome ...)

Developers Guide

Integration Principles

· Include the Cti and Callback javascript API from the Xuc Server

• Include also the xc_webrtc and SIPml5 javascript APIs for the webRTC support:

• Connect to the Xuc server using new Authentication token (see Obtain authentication token)

```
var wsurl = "ws://"+server+"/xuc/api/2.0/cti?token="+token;
Cti.WebSocket.init(wsurl,username,phoneNumber);
```

• Connect to the Xuc server using XiVO client username and password (DEPRECATED)

· Setup event handlers to be notified on

- Phone state changes
- Agent state changes
- Statistics
- ...
- · Eventually also webRTC handlers
 - general
 - register
 - incoming
 - outgoing
- Once web socket communication is established you are able to call XuC Cti javascript methods.
 - Place a call, log an agent

```
...
$('#login_btn').click(function(event){
    Cti.loginAgent($('#agentPhoneNumber').val());
});
$('#logout_btn').click(function(event){
    Cti.logoutAgent();
});
$('#xuc_dial_btn').click(function(event){
    Cti.dial($("#xuc_destination").val());
});
```

Sample Application

A sample application is provided by the XuC server. This application allows to display events and using different methods exposed by the XuC

http://<sucserver>:<xucport>/sample

You may browse and use the sample.js javascript file as an example

• Calling Cti methods :

| Areascript APT | | | | | | | |
|--------------------------|---|----------------------------|--------------------|-----------------------|--------|---------------------|----------------|
| XuC Web In | | | loca/host.9000 | bruce | | 1000 | 👷 🗏 Sign in |
| This is a templa | This is a template for a xivo ctl server integration samples. | | | | | | |
| Agent | | User | Stat | ts | Agen | tEvents | |
| Agent Status | | Presence + | Sub | scribe to queue stats | Subscr | ibe to Agent Events | |
| | Agent Phone Number | Phone Status En. DAD | Dis. DND | | | | |
| 1000 | | User Status | | | | | |
| Agt log in Toggle Log | Aptilop out In Pause Un Pause | | Interior name to s | | | | |
| Queues | 5 | Queue Memb | bers Ag | ents | Age | nts | |
| Get queues | | Get Q members | - | agents | | directory | |
| © Company 2013 | | | | | | | |

```
.$('#xuc_login_btn').click(function(event) {
    Cti.loginAgent($('#xuc_agentPhoneNumber').val());
});
$('#xuc_logout_btn').click(function(event) {
    Cti.logoutAgent();
});
$('#xuc_pause_btn').click(function(event) {
    Cti.pauseAgent();
});
$('#xuc_unpause_btn').click(function(event) {
    Cti.unpauseAgent();
});
$('#xuc_subscribe_to_queue_stats_btn').click(function(event) {
    Cti.subscribeToQueueStats();
});
$('#xuc_answer_btn').click(function(event) {
    Cti.answer();
});
$('#xuc_hangup_btn').click(function(event) {
    Cti.hangup();
});
$('#xuc_login_btn').click(function(event) {
    Cti.loginAgent($('#xuc_agentPhoneNumber').val());
});
$('#xuc_logout_btn').click(function(event) {
    Cti.logoutAgent();
});
$('#xuc_togglelogin_btn').click(function(event) {
    Cti.toggleAgentLogin();
});
$('#xuc_pause_btn').click(function(event) {
    Cti.pauseAgent();
});
$('#xuc_unpause_btn').click(function(event) {
    Cti.unpauseAgent();
});
$('#xuc_subscribe_to_queue_stats_btn').click(function(event) {
    Cti.subscribeToQueueStats();
});
$('#xuc_answer_btn').click(function(event) {
```

```
Cti.answer();
});
$('#xuc_hangup_btn').click(function(event) {
   Cti.hangup();
});
$('#xuc_get_agent_call_history').click(function() {
   Cti.getAgentCallHistory(7);
});
$('#xuc_get_user_call_history').click(function() {
   Cti.getUserCallHistory(7);
});
```

.

• Declaring events handlers :

```
Cti.setHandler(Cti.MessageType.USERSTATUSES, usersStatusesHandler);
Cti.setHandler(Cti.MessageType.USERSTATUSUPDATE, userStatusHandler);
Cti.setHandler(Cti.MessageType.USERCONFIGUPDATE, userConfigHandler);
Cti.setHandler(Cti.MessageType.LOGGEDON, loggedOnHandler);
Cti.setHandler(Cti.MessageType.PHONESTATUSUPDATE, phoneStatusHandler);
Cti.setHandler(Cti.MessageType.VOICEMAILSTATUSUPDATE, voiceMailStatusHandler);
Cti.setHandler(Cti.MessageType.LINKSTATUSUPDATE, linkStatusHandler);
Cti.setHandler(Cti.MessageType.QUEUESTATISTICS, queueStatisticsHandler);
Cti.setHandler(Cti.MessageType.QUEUECONFIG, queueConfigHandler);
Cti.setHandler(Cti.MessageType.QUEUELIST, queueConfigHandler);
Cti.setHandler(Cti.MessageType.QUEUEMEMBER, queueMemberHandler);
Cti.setHandler(Cti.MessageType.QUEUEMEMBERLIST, queueMemberHandler);
Cti.setHandler(Cti.MessageType.DIRECTORYRESULT, directoryResultHandler);
Cti.setHandler(Cti.MessageType.AGENTCONFIG, agentConfigHandler);
Cti.setHandler(Cti.MessageType.AGENTLIST, agentConfigHandler);
Cti.setHandler(Cti.MessageType.AGENTGROUPLIST, agentGroupConfigHandler);
Cti.setHandler(Cti.MessageType.AGENTSTATEEVENT, agentStateEventHandler);
Cti.setHandler(Cti.MessageType.AGENTERROR, agentErrorHandler);
Cti.setHandler(Cti.MessageType.ERROR, errorHandler);
Cti.setHandler(Cti.MessageType.AGENTDIRECTORY, agentDirectoryHandler);
Cti.setHandler(Cti.MessageType.CONFERENCES, conferencesHandler);
Cti.setHandler(Cti.MessageType.CALLHISTORY, callHistoryHandler);
xc_webrtc.setHandler(xc_webrtc.MessageType.GENERAL, webRtcGeneralEventHandler);
xc_webrtc.setHandler(xc_webrtc.MessageType.REGISTRATION,_
→webRtcRegistrationEventHandler);
xc_webrtc.setHandler(xc_webrtc.MessageType.INCOMING, webRtcIncomingEventHandler);
xc_webrtc.setHandler(xc_webrtc.MessageType.OUTGOING, webRtcOutgoingEventHandler);
```

Debugging

Cti features

Cti events can be logged in the console if the Cti.debugMsg variable is set to true, you can do it directly in the developer tools console:

Cti.debugMsg=true;

You'll then get send and received events in the console log (prefixed by S>>> and R<<< respectively):

```
2016-11-23 14:48:59.180 S>>> {"claz":"web","command":"dial","destination":"111",

→"variables":{}}
2016-11-23 14:48:59.557 R<<< {"msgType":"PhoneStatusUpdate","ctiMessage":{"status":

→"CALLING"}}
```

Description

Login and Authentication

User login

Users can connect using login, password and phone number:

```
var wsurl = "ws://"+server+"/xuc/api/2.0/cti?token="+token;
Cti.WebSocket.init(wsurl,username,phoneNumber);
```

Agent login

An agent can be logged in using *Cti.loginAgent(agentPhoneNumber, agentId)*. For the moment, the phone number used for agent login should be the same as the one used for user login, otherwise you will get many error messages "LoggedInOnAnotherPhone".

Following cases are handled:

- agent is not logged and requests a login to a known line: the agent is logged in
- agent is not logged and requests a login to an unknown line: an error is raised:

{"Error":"PhoneNumberUnknown"}

- agent is already logged on the requested line: the agent stays logged
- agent is already logged on another line: an error is raised and the agent stays logged (on the number where he was logged before the new request). It's up to the implementation to handle this case.

```
{"Error":"LoggedInOnAnotherPhone","phoneNb":"1002","RequestedNb":"1001"}
```

• agent is not logged and requests a login to a line already used by another agent: the agent takes over the line and the agent previously logged on the line is unlogged

Generic CTI Events

Error

• Cti.MessageType.ERROR

LoggedOn

Cti.MessageType.LOGGEDON

Directory And Favorites

Cti.directoryLookUp: function(term)

This command deprecates previously used *Cti.searchDirectory(pattern)*. This command deprecates previously used *Cti.searchDirectory(pattern)* removed in xuc xivo16 versions.

Note: If dird is not configured, xivo.useDird should be configured to false, and search directory will fallback using the cti server

Associated Handler

Cti.MessageType.DIRECTORYRESULT

Triggered by command Cti.directoryLookUp(pattern).

Cti.getFavorites: function()

Cti.addFavorite: function(contactId, source)

Cti.removeFavorite: function(contactId, source)

Cti Events

Sheet

• Cti.MessageType.SHEET

User Statuses

• Cti.MessageType.USERSTATUSES : "UsersStatuses"

User Status Update

• Cti.MessageType.USERSTATUSUPDATE : "UserStatusUpdate",

User Config Update

• Cti.MessageType.USERCONFIGUPDATE : "UserConfigUpdate",

```
{"msgType":"UserConfigUpdate",
    "ctiMessage":{"userId":9,"dndEnabled":false,"naFwdEnabled":false,
    "naFwdDestination":"", "uncFwdEnabled":false,"uncFwdDestination":"",
    "busyFwdEnabled":false,"busyFwdDestination":"",
    "firstName":"Alice","lastName":"Johnson","fullName":"Alice Johnson",
    "mobileNumber":"064574512","agentId":22,"lineIds":[5],"voiceMailId":58,
    "voiceMailEnabled":true}}
```

Phone Status Update

• Cti.MessageType.PHONESTATUSUPDATE

Phone Events

- Cti.MessageType.PHONEEVENT
- Cti.MessageType.CURRENTCALLSPHONEEVENTS

Phone events are automatically sent when application is connected.

Format

```
{
   "msgType":"PhoneEvent",
   "ctiMessage":{
       "eventType":"EventRinging",
       "DN":"1118",
       "otherDN":"1058",
        "otherDName":"Jane Black",
        "linkedId":"1447670380.34",
        "uniqueId":"1447670382.37",
        "queueName":"blue",
        "callDirection": "Incoming",
        "userData":{
            "XIVO_CONTEXT":"default","XIVO_USERID":"9","XIVO_SRCNUM":"1058","XIVO_
→DSTNUM":"3000"
       }
   }
```

| fields | Description |
|---------------|--|
| Event types | EventReleased EventDialing EventRinging EventEstablished EventOnHold |
| DN | The directory number of the event |
| otherDN | Can be calling number of called number |
| otherDName | Can be name of caller of called number |
| queueName | Optional, the queue name for inbound acd calls |
| callDirection | Can be Incoming or Outgoing |
| UserData | Contains a list of attached data, system data XIVO_ or data attached to the call key beginning by USR_ |
| | or data attached to the can key beginning by USR_ |

If you use the following preprocess subroutine

```
[user_data_test]
exten = s,1,Log(DEBUG,**** set user data ****)
same = n,SET(USR_DATA1=hello)
same = n,SET(USR_DATA2=24)
same = n,SET(USR_DATA3=with space)
same = n,Return()
```

you will get these data in the events. Data can also be attached using the Cti.dial command.

You can also request a message with a concatenation of PhoneEvents for current calls by *Cti.getCurrentCallsPhoneEvents* command. The response to this command is formatted as follows:

```
{
   "msgType":"CurrentCallsPhoneEvents",
   "ctiMessage":{
        "events": [
        {
          "eventType":"EventRinging",
          "DN":"1118",
          "otherDN":"1058",
          "otherDName":"Jane Black",
          "linkedId":"1447670380.34",
          "uniqueId":"1447670382.37",
          "queueName":"blue",
          "callDirection": "Incoming",
          "userData":{
             "XIVO_CONTEXT":"default","XIVO_USERID":"9","XIVO_SRCNUM":"1058",
→"XIVO_DSTNUM":"3000"
          }
        },
        {
          "eventType":"EventEstablished",
          . . .
        },
        . . .
   }
```

Voice Mail Status Update

• VOICEMAILSTATUSUPDATE : "VoiceMailStatusUpdate",

Link Status Update

• Cti.MessageType.LINKSTATUSUPDATE

User Right Profile

• Cti.MessageType.RIGHTPROFILE: "RightProfile"

```
{"msgType":"RightProfile","ctiMessage":{"profile":"Supervisor"}}
```

This message is sent upon connection to the xuc websocket. The profile can be one of: "Supervisor", "Admin", "NoRight".

Queue Statistics

• Handler on : Cti.MessageType.QUEUESTATISTICS

The handler is executed when a notification of new statistic values is received. Each message contains one or more counters for one queue. The queue is identified by its queueId. See example below for reference. The queue's id can be used to retrieve queue's configuration, see *Queue Configuration*.

Following counters are available:

- TotalNumberCallsEntered
- TotalNumberCallsAnswered
- PercentageAnsweredBefore15
- TotalNumberCallsAbandonned
- TotalNumberCallsAbandonnedAfter15
- PercentageAbandonnedAfter15
- WaitingCalls
- LongestWaitingTime
- EWT
- AvailableAgents
- TalkingAgents

```
"msgType":"QueueStatistics",
    "ctiMessage":{
        "queueId":11,"counters":[{"statName":"AvailableAgents","value":0}, {
        →"statName":"LoggedAgents","value":0}, {"statName":"TalkingAgents","value":0}, {
        →"statName":"EWT","value":0}]
     }
}
```

Some events contain a queueRef with a queue's name instead of the queueId. This issue should be eliminated in future versions.

Queue Calls

• Handler on: Cti.MessageType.QUEUECALLS

Awaiting calls in a queue. Subscription to the events with : *Cti.subscribeToQueueCalls(9)* (9 being the queueId). Unsubscription with: *Cti.unSubscribeToQueueCalls(9)*.

```
{"queueId":9,"calls":[{"position":1,"name":"John Doe","number":"33356782212",

→"queueTime":"2015-07-16T10:40:16.626+02:00"}]}
```

Queue Configuration

• QUEUECONFIG : "QueueConfig",

{"id":8,"context":"default","name":"blue","displayName":"blue sky","number":"3506"}

Queue List

• QUEUELIST : "QueueList",

```
{
    "msgType":"QueueList",
    "ctiMessage":[
        {"id":170,"context":"default","name":"bluesky","displayName":"Bl Record",
\rightarrow "number": "3012"},
        {"id":5,"context":"default","name":"noagent","displayName":"noagent",
\rightarrow "number": "3050"},
        {"id":6,"context":"default","name":"___switchboard_hold","displayName":

Switchboard hold", "number": "3005"},

        {"id":173,"context":"default","name":"outbound","displayName":"outbound",
\leftrightarrow "number": "3099"},
        {"id":2,"context":"default","name":"yellow","displayName":"yellow stone",
\leftrightarrow "number": "3001"},
        {"id":7,"context":"default","name":"green","displayName":"green openerp",
\leftrightarrow "number": "3006"},
        {"id":3,"context":"default","name":"red","displayName":"red auto polycom",
\leftrightarrow "number": "3002"},
        {"id":11,"context":"default","name":"pool","displayName":"Ugips Pool",
\rightarrow "number": "3100"},
        {"id":4,"context":"default","name":"___switchboard","displayName":

witchboard", "number": "3004"

        1
```

Queue Member

• Handler on : Cti.MessageType.QUEUEMEMBER

Received when an agent is associated to a queue or a penalty is updated. Penalty is -1 when agent is removed from a queue

{"agentId":19,"queueId":3,"penalty":12}

Queue Member List

• Handler on : Cti.MessageType.QUEUEMEMBERLIST

Agent State Event

- Cti.MessageType.AGENTSTATEEVENT
 - AgentLogin (DEPRECATED: Agent are now going directly from AgentLoggedOut to AgentReady)

- AgentReady

- AgentOnPause

- AgentOnWrapup

- AgentRinging

- AgentDialing

- AgentOnCall

```
{"msgType":"AgentStateEvent","ctiMessage":
    {"name":"AgentOnCall","agentId":19,"phoneNb":"1000","since":0,
    o"queues":[8,14,170,4,1],
        "cause":"available","acd":false,"direction":"Incoming",
    o"callType":"External","monitorState":"ACTIVE"}}
```

- AgentLoggedOut

Agent Error

• Cti.MessageType.AGENTERROR

Agent Directory

• Cti.MessageType.AGENTDIRECTORY

Triggered by command Cti.getAgentDirectory

```
{"directory": [
    { "agent":
        {"context": "default", "firstName": "bj", "groupId": 1, "id": 8, "lastName
        ·": "agent", "number": "2000"},
            "agentState": {"agentId": 8, "cause": "", "name": "AgentReady", "phoneNb":
            ·"1001", "queues": [1, 2], "since": 2 }}]
```

Agent Configuration

• Cti.MessageType.AGENTCONFIG

Triggered when agent configuration changes

{"id":23,"firstName":"Jack","lastName":"Flash","number":"2501","context":"default"}

Agent List

• Cti.MessageType.AGENTLIST

Receives agent configuration list in a javascript Array : Command Cti.getList("agent");

```
[
    {"id":24,"firstName":"John","lastName":"Waynes","number":"2601","context":
    ·"default","groupId":1},
    {"id":20,"firstName":"Maricé","lastName":"Saprïtchà","number":"2602","context":
    ·"default","groupId":1},
    {"id":147,"firstName":"Etienne","lastName":"Burgad","number":"30000","context":
    ·"default","groupId":1},
    {"id":148,"firstName":"Caroline","lastName":"HERONDE","number":"29000","context
    ·":"default","groupId":2},
    {"id":149,"firstName":"Eude","lastName":"GARTEL","number":"75000","context":
    ·"default","groupId":3},
    {"id":22,"firstName":"Alice","lastName":"Johnson","number":"2058","context":
    ·"default","groupId":5}]
```

Agent Listen

• AGENTLISTEN: "AgentListen",

Receives agent listen stop / start event, received automatically if user is an agent, no needs to subscribe.

```
{"started":false, "phoneNumber":"1058", "agentId":22}
```

Agent Group List

• AGENTGROUPLIST : "AgentGroupList"

Agent group list triggered by command : Cti.getList("agentgroup")

```
{"id":1,"name":"default"},
{"id":2,"name":"boats"},
{"id":3,"name":"broum"},
{"id":4,"name":"bingba3nguh"},
{"id":5,"name":"salesexpert"},
{"id":6,"name":"a_very_long_group_name"}]
```

Agent Statistics

Received on subscribe to agent statistics with method *Cti.subscribeToAgentStats()*, current statistics are received automatically on subscribe.

• AGENTSTATISTICS : "AgentStatistics"

```
{"id":22,
    "statistics":[
        {"name":"AgentPausedTotalTime","value":0},
        {"name":"AgentWrapupTotalTime","value":0},
        {"name":"AgentReadyTotalTime","value":434},
        {"name":"LoginDateTime","value":"2015-04-27T08:15:01.081+02:00"},
        {"name":"LogoutDateTime","value":"2015-04-27T08:14:49.427+02:00"}
        ]
```

Call History

Cti.getUserCallHistory(size)

Get the call history of the logged in user, limited to the last *size* calls.

Cti.getAgentCallHistory(size)

Get the call history of the logged in agent, limited to the last size calls.

Cti.getQueueCallHistory(queue, size)

Get a call history for a queue or a set of queues. You may pass part of a queue name (not display name). i.e. pass bl if you want to match queue name blue, black and blow

Associated Handler CALLHISTORY

Received when calling the above methods Cti.getAgentCallHistory(size) or Cti.getUserCallHistory(size).

• CALLHISTORY : "CallHistory"

```
{
    "start":"2014-01-01 08:00:00",
    "duration":"00:21:35",
    "srcNum":"0115878",
    "dstNum":"2547892",
    "status":"answered"
}
```

For queue calls status can be :

- full full queue
- closed closed queue
- joinempty call arrived on empty queue
- · leaveempty exit when queue becomes empty
- divert_ca_ratio -call redirected because the ratio waiting calls/agents was exceeded
- divert_waittime call redirected because estimated waiting time was exceeded;
- answered call answered
- abandoned call abandoned
- timeout maximum waiting time exceeded

For other calls

- emitted
- missed
- ongoing

Callback Events

Callback lists

Received when calling Callback.getCallbackLists().

• CALLBACKLISTS : "CallbackLists"

```
{"uuid":"b0849ac0-4f4a-4ed0-9386-53ab2afd94b1",
"name":"Liste de test",
"queueId":1,
"callbacks":[
  {"uuid":"a967da84-bc41-4bf4-a4fc-2bcc54e11606",
  "listUuid":"b0849ac0-4f4a-4ed0-9386-53ab2afd94b1",
  "phoneNumber":"0230210082",
  "mobilePhoneNumber":"0789654123",
  "firstName":"Alice",
  "lastName":"O'Neill",
  "company":"YourSociety",
  "description":null,
  "agentId":null,
  "dueDate": "2016-08-01",
  "preferredPeriod": {
     "default": false,
     "name": "Afternoon",
     "periodStart": "14:00:00",
     "periodEnd": "17:00:00",
     "uuid": "d3270038-e20e-498a-af71-3cf69b5cc792"
  ] }
```

Callback Taken

Received after taking a callback with Callback.takeCallback(uuid).

CALLBACKTAKEN : "CallbackTaken"

```
{"uuid":"a967da84-bc41-4bf4-a4fc-2bcc54e11606",
    "agentId":2}
```

Callback Started

Received after starting a callback with Callback.startCallback(uuid, phoneNumber).

• CALLBACKSTARTED : "CallbackStarted"

```
{"requestUuid":"a967da84-bc41-4bf4-a4fc-2bcc54e11606",
"ticketUuid":"8e82de0f-847a-4606-97bf-bef5a18ea8b0"}
```

Callback Clotured

Received after giving to a callback a status different of Callback.

• CALLBACKCLOTURED : "CallbackClotured"

```
{"uuid":"a967da84-bc41-4bf4-a4fc-2bcc54e11606"}
```

Callback Released

Received after releasing a callback with Callback.releaseCallback(uuid).

```
• CALLBACKRELEASED : "CallbackReleased"
```

```
{"uuid":"a967da84-bc41-4bf4-a4fc-2bcc54e11606"}
```

Callback Updated

Received when calling *Callback.updateCallbackTicket(uuid, status, description, dueDate, periodUuid)* with a new due date or period.

CALLBACKREQUESTUPDATED : "CallbackRequestUpdated"

```
{"request": {
    "uuid":"a967da84-bc41-4bf4-a4fc-2bcc54e11606",
    "listUuid":"b0849ac0-4f4a-4ed0-9386-53ab2afd94b1",
    "phoneNumber":"0230210082",
    "mobilePhoneNumber":"0789654123",
    "firstName":"Alice",
    "lastName":"O'Neill",
    "company":"YourSociety",
    "description":null,
    "agentId":null,
    "dueDate": "2016-08-01",
    "preferredPeriod": {
        "default": false,
    }
}
```

```
"name": "Afternoon",
    "periodStart": "14:00:00",
    "periodEnd": "17:00:00",
    "uuid": "d3270038-e20e-498a-af71-3cf69b5cc792"
}
```

Membership Events

User default membership

Received when calling Membership.getUserDefaultMembership(userId).

• USERQUEUEDEFAULTMEMBERSHIP: "UserQueueDefaultMembership"

```
{
    "userId":186,
    "membership": [
        {"queueId":8,"penalty":1},
        {"queueId":17,"penalty":0},
        {"queueId":18,"penalty":0},
        {"queueId":23,"penalty":0}
]
}
```

Agent Methods

Cti.loginAgent(agentPhoneNumber, agentId)

Log an agent

Cti.logoutAgent(agentId)

Un log an agent

Cti.pauseAgent(agentId)

Change agent state to pause

Cti.unpauseAgent(agentId)

Change agent state to ready

Cti.listenAgent(agentId)

Listen to an agent

Cti Methods

Cti.changeUserStatus()

Update user status using a cti server configured status name

Cti.dnd(state)

Set or unset do not disturb, state true or false

Phone Methods

Cti.setData(variables)

Attach data to the device current calls. When there is a call connected to a device, Data can be attached by passing key values as a json object *Cti.setData("{'var1':'val1','USR_var2':'val2'}");*

The folowing json message is then sent to the server :

{"claz":"web","command":"setData","variables":{"var1":"val1","USR_var2":"val2"}}

When the call is transfered i.e. (*Cti.directTransfer(destination)*), data is sent in the event ringing see *Phone Events*, and in subsequent events. Data is not propagated in the reporting database.

```
{"eventType":"EventRinging","DN":"1000","otherDN":"0427466347","linkedId":

->"1469709757.74","uniqueId":"1469709960.78","queueName":"bluesky",

"userData":{

"XIVO_CONTEXT":"from-extern",

"XIVO_USERID":"1",

"USR_var1":"val1",

"USR_var2":"val2",

"XIVO_EXTENPATTERN":"_012305XXXX",

"XIVO_SRCNUM":"0427466347",

"XIVO_DST_FIRSTNAME":"Brucé",

"XIVO_DST_FIRSTNAME":"Brucé",

"XIVO_DSTNUM":"0123053012","XIVO_DST_LASTNAME":"Wail"}}
```

Note that USR_ prefix is added to the key, if the key does not start with it. Only attached data beginning with USR_ are sent back to the client API.

Warning: When transfering a call, these variables are attached to the new channel however to prevent propagation on all trunk channels, your trunk name must contain 'trunk' so they can be distinguished from sip devices.

Cti.dial(destination, variables)

Place a call to destination with the provided variables. Variables must take the following form:

```
{
    var1: "value 1",
    var2: "value 2"
}
```

USR_var1 and USR_var2 will be attached to the call and propagated to Phone Events

Cti.dialFromMobile(destination, variables)

Place a call from logged user's mobile number to destination with the provided variables. Variables must take the following form:

```
{
    var1: "value 1",
    var2: "value 2"
}
```

USR_var1 and USR_var2 will be attached to the call and propagated to Phone Events

Cti.dialFromQueue(destination, queueld, callerId, variables)

Creates outgoing call to destination from some free Agent attached to queueId. Caller id on both sides is set to callerId.

Variables must take the following form:

```
{
   var1: "value 1",
    var2: "value 2"
```

}

USR_var1 and USR_var2 will be attached to the call and propagated to Phone Events

Limitations: Queue No Answer settings does not work - see No Answer. Except: when there is no free Agent to queue (none attached, all Agents on pause or busy), then No answer settings work (but Fail does not).

Note: Line should be configured with enabled "Ring instead of On-Hold Music" enabled (on "Application: tab in queue configuration - see *Queues*). Otherwise the queue will answers the call and the destination rings even if there are no agents available.

Cti.originate(destination)

Originate a call

Cti.hangup()

Hangup a call

Cti.answer()

Answer a call

Cti.hold()

Put current call on hold

Cti.directTransfer(destination)

Tranfert to destination

Cti.attendedTransfer(destination)

Start a transfer to a destination

Cti.completeTransfer()

Complete previously started transfer

Cti.cancelTransfer()

Cancel a transfer

Cti.monitorPause(agentId)

Pause call recording

Note: You can only pause the recording of a call answered by an agent (i.e. a call sent via a Queue towards an Agent).

Cti.monitorUnpause(agentId)

Unpause call recording

Note: You can only pause the recording of a call answered by an agent (i.e. a call sent via a Queue towards an Agent).

Cti.getList(objectType)

Request a list of configuration objects, objectType can be :

- queue
- agent
- queuemember

Triggers handlers QUEUELIST, AGENTLIST, QUEUEMEMBERLIST. Subscribes to configuration modification changes, handlers QUEUECONFIG, AGENTCONFIG, QUEUEMEMBER can also be called

Cti.getConferenceRooms()

Request the list of conference rooms. Also receive event when the list is updated.

Warning: The xuc user must have a line.

```
{
    "number": "4000",
    "name": "public",
```

```
"pinRequired": false,
  "startTime": 1519659524032,
  "members": [
    {
      "joinOrder": 1,
      "joinTime": 1519659524032,
      "muted": false,
      "name": "James Bond",
      "number": "1002"
    }
  1
},
{
  "number": "4001",
  "name": "conference_support",
  "pinRequired": true,
  "startTime": 0,
  "members": []
}
```

Cti.getCurrentCallsPhoneEvents()

1

Request PhoneEvents for current device calls. See Phone Events for answer description.

Cti.setAgentQueue(agentId, queueId, penalty)

- agentId (Integer) : id of agent, returned in message Agent Configuration
- queueId (Integer) : id of queue, returned in message Queue Configuration
- penaly (Integer) : positive integer

If agent is not associated to the queue, associates it, otherwise changes the penalty

On success triggers a Queue Member event, does not send anything in case of failure :

{"agentId":<agentId>, "queueId":<queueId>, "penalty":<penalty>}

Cti.removeAgentFromQueue(agentId, queueId)

- agentId (Integer) : id of agent, returned in message Agent Configuration
- queueId (Integer) : id of queue, returned in message Queue Configuration

On success triggers a queue member event with penalty equals to -1, does not send anything in case of failure :

{"agentId":<agentId>, "queueId":<queueId>, "penalty":-1}

Cti.subscribeToAgentStats()

Subscribe to agent statistics notification. When called all current statistics are receive, and a notification is received for each updates. Both initial values and updates are transmitted by the *Agent Statistics* events.

Cti.subscribeToQueueStats()

This command subscribes to the queue statistics notifications. First, all actual statistics values are sent for initialisation and then a notification is sent on each update. Both initial values and updates are transmitted by the QUEUESTATISTICS events.

Cti.naFwd(destination,state)

Forward on non answer

Cti.uncFwd(destination,state)

Unconditionnal forward

Cti.busyFwd(destination,state)

Forward on busy

Callback Commands

Callback.getCallbackLists()

Retrieve the lists of callbacks with teir associated callback requests, and subscribe to callback events.

Callback.takeCallback(uuid)

Take the callback with the given uuid with the logged-in agent.

Callback.releaseCallback(uuid)

Release the callback which was previously taken

Callback.startCallback(uuid, phoneNumber)

Launch the previously taken callback with the provided phone number.

Callback.updateCallbackTicket(uuid, status, description, dueDate, periodUuid)

Update a callback ticket wih the provided description and status. Allowaed values for status are:

- NoAnswer
- Answered
- Fax
- Callback

dueDate is an optional parameter specifying the new due date using ISO format ("YYYY-MM-DD"). periodUuid is an optional parameter specifying the new preferred period for the callback.

Membership Commands

Membership.init(cti)

Initialize the Membership library using the given Cti object.

Membership.getUserDefaultMembership(userId)

Request the default membership for the given user id. Warning, the userId is not the same as the agentId.

Membership.setUserDefaultMembership(userId, membership)

Set the default membership for the given user id. Warning, the userId is not the same as the agentId. 'membership' should be an array of Queue membership like:

```
[
  {"queueId":8, "penalty":1},
  {"queueId":17, "penalty":0},
  {"queueId":18, "penalty":0},
  {"queueId":23, "penalty":0}
]
```

Membership.setUsersDefaultMembership(userIds, membership)

Set the default membership for the given array of user id. Warning, the userId is not the same as the agentId. 'userIds' should be an array of user id like :

[1, 2, 3]

'membership' should be an array of Queue membership like:

```
[
  {"queueId":8, "penalty":1},
  {"queueId":17, "penalty":0},
  {"queueId":18, "penalty":0},
  {"queueId":23, "penalty":0}
]
```

Membership.applyUsersDefaultMembership(userIds)

Apply the existing default configuration to a set of users. Warning, the userId is not the same as the agentId. 'usersIds' should be an array of userId like:

:: [1, 2, 7, 9]

Security considerations

Defining a user profile in the ConfigMGT impact the behavior of this api.

No Profile

If no profile is found, the behavior falls back on the Admin Profile behavior.

Admin Profile

An admin profile will be allowed to receive all events and send all commands.

Supervisor Profile

A supervisor profile has the some properties impacting the events he can receive:

- A list of queue which will filter the following events based on the queues in this list (send event only for queues defined in the list):
 - QueueList
 - QueueMemberList
 - QueueStatistics
- A list of groups which will filter the following events based on the groups in this list (send event only if matching agent group is in the list):
 - AgentStateEvent
 - AgentStatistics
 - AgentGroupList
 - AgentList

Conferences API

This api is to manipulate voice conference room

You can refer to Conference Room configuration for organizer feature

Conference Events

See associated Conference Methods

Conference Event

• Cti.MessageType.CONFERENCEEVENT

Received when you enter or leave a conference room.

```
{
  "eventType": "Join",
  "uniqueId": "1519658665.8",
  "conferenceNumber": "4001",
  "conferenceName": "conference_support",
  "participants": [
   {
      "index": 1,
      "callerIdName": "James Bond",
      "callerIdNum": "1002",
      "since": 0,
      "isTalking": false,
      "role": "User",
      "isMuted": false,
      "isMe": true,
   }
 ],
```

"since": 0

}

Fields description :

- eventType: "Join" or "Leave"
- uniqueId: channel / call unique id entering this conference (related to Phone events)
- conferenceNumber: DN Number of the joined/left conference
- conferenceName: Name of the joined/left conference
- participants: array of participant
- since: delay in seconds since the beginning of the conference

Conference Participant Event

Cti.MessageType.CONFERENCEPARTICIPANTEVENT

Received when a participant enter, leave, or be updated in your conference room.

```
{
   "eventType": "Update",
   "uniqueId": "1519658665.8",
   "conferenceNumber": "4001",
   "index": 1,
   "callerIdName": "James Bond",
   "callerIdNum": "1002",
   "since": 0,
   "isTalking": true,
   "role": "Organizer",
   "isMuted": false,
   "isMe": false
}
```

Fields description :

- eventType: "Join", "Leave" or "Update"
- uniqueId: channel / call unique id entering this conference (related to Phone events)
- conferenceNumber: DN Number of the joined/left conference
- conferenceName: Name of the joined/left conference
- index: position of the participant in the conference
- callerIdName: Name of the participant
- callerIdNum: DN Number of the participant
- since: delay in seconds since the beginning of the conference
- isTalking: true or false if participant is talking
- role: participant role, either "User" or "Organizer"
- isMuted: indicate if participant is muted
- isMe: indicate if participant is the current user

Conference Command Error Event

Cti.MessageType.CONFERENCECOMMANDERROR

Received after a conference command (mute/unmute, muteme/unmuteme, muteall/unmuteall, kick) if an error is encountered while processing the command

```
"error": "NotAMember"
```

{

The error code can be one of the following:

- NotAMember: The current user is not a member of the given conference number.
- NotOrganizer: The current user is not an organizer in the given conference number and cannot perform the command.
- CannotKickOrganizer: You cannot kick an organizer out of a conference.
- ParticipantNotFound: The targeted participant wasn't found.

Conference Methods

Cti.conference()

Start a conference using phone set capabilities

Cti.conferenceMuteMe(conferenceNumber)

Mute the current user in the given conference. See also *conference_command_error*.

Cti.conferenceUnmuteMe(conferenceNumber)

Un-mute the current user in the given conference

See also conference_command_error.

Cti.conferenceMuteAll(conferenceNumber)

Mute all attendees except current user in the given conference. This method is restricted to conference organizer so you must enter the conference with an organizer pin.

See also *conference_command_error*.

Cti.conferenceUnmuteAll(conferenceNumber)

Un-Mute all attendees in the given conference. This method is restricted to conference organizer so you must enter the conference with an organizer pin.

See also *conference_command_error*.

Cti.conferenceMute(conferenceNumber, index)

Mute an attendee by its index in the given conference. This method is restricted to conference organizer so you must enter the conference with an organizer pin.

See also *conference_command_error*.

Cti.conferenceUnmute(conferenceNumber, index)

Un-Mute an attendee by its index in the given conference. This method is restricted to conference organizer so you must enter the conference with an organizer pin.

See also *conference_command_error*.

Cti.conferenceKick(conferenceNumber, index)

Kick an attendee out of the given conference by its index. This method is restricted to conference organizer so you must enter the conference with an organizer pin.

See also *conference_command_error*.

WebRTC API

WebRTC features

The WebRTC debug can be activated separately by the following method:

xc_webrtc.setDebug(sipml5level, event, handler)

Where:

- sipml5level refers to the SIPml5 library log level string as described on SIPml5 log level documentation,
- event is a boolean value activating event logging (each event is prefixed by RE<<<),
- handler is a boolean value activating logging of message handler subscription/unsubscription.

WebRTC on sample page

Once logged on the sample page, you can init the webRTC through the init button, follow events shown in the webRTC section and send and receive calls. You can terminate a call by the terminate button in the phone section. Attended transfer can be performed using xfer buttons. Hold and DTMF features are available via the webRTC API. You can receive or make up to 2 calls, answer and hold methods do their best to put other calls on hold when answering or hold the call which is not held (or resume the one which is held), but currently the SIPml5 session ids are not exposed, so you have to avoid getting in a situation where it's not clear from the context what needs to be done, for example putting on hold two calls in the same time.

Current browsers doesn't allow media sharing without secure connections - https and wss. The xivoxc_nginx docker image contains the configuration required for loading the sample page over a secure connection using an auto-signed certificate. This certificate is automatically generated by the installation script. It is meant to be used only for test purposes, you should replace it by a signed certificate before switching to production. The sample page is available on the following address: https://MACHINE_IP:8443/sample

webRTC Methods

Once the cti login done, you can init the webRTC component by calling the xc_webrtc.init method.

xc_webrtc.init(name, ssl, websocketPort, remoteAudio, ip)

Init the webRTC connection and register the user's line.

- name user's login to get the line details,
- ssl if set to true the wss is used,
- websocketPort, ip port and address for the webRTC websocket connection, when ip is not passed the xivo ip is used,
- remoteAudio id of the HTML5 audio element for remote audio player, if not passed 'audio_remote' is used. The element should look like:

<audio id="audio_remote" autoplay="autoplay"></audio>

xc_webrtc.dial(destination, video)

Start a webRTC call to the *destination*.

Warning: The video call support is currently an experimental feature and the API can change any time.

The 'video' parameter is optional, if omitted it's considered as false and allows you to start an audio/video call. Currently, multiple concurrent video calls are not supported, all video calls reuse the same video elements. The local video element has to be created by the user of the API with id video-local and a second video element for remote video stream with id video-remote.

xc_webrtc.answer()

Answer an incoming webRTC call.

Note: The library accepts as an optional parameter the session id, but these ids are not currently reported in events. This parameter is currently reserved for internal use.

xc_webrtc.hold()

Toggle hold on a webrtc call.

Note: The library accepts as an optional parameter the session id, but these ids are not currently reported in events. This parameter is currently reserved for internal use.

xc_webrtc.dtmf(key)

Send a DTMF.

xc_webrt.attendedTransfer(destination)

Start an attendedTransfer to the destination. This method designed to work with the AMI based transfer implemented by the XUC server, so it first puts current calls on hold and then starts a new call in an auto-answer mode.

xc_webrtc.compeleteTransfer()

Complete an attended transfer. It's a simple wrapper of the Cti method introduced to complete the API of the xc_webrtc library.

xc_webrtc.setHandler(eventName, handler)

Set a handler for eventName from xc_webrtc.MessageType.

xc_webrtc.disableICE()

Disable ICE server use, only LAN addresses will be used in the SDP.

xc_webrtc.setIceUrIs(urIs)

Set a list of STUN/TURN servers, for example:

webRTC Events

There are four groups of events:

- general,
- register,
- incoming,
- outgoing.

List of associated events is defined in the *xc_webrtc.General*, *xc_webrtc.Registration*, *xc_webrtc.Incoming*, *xc_webrtc.Outgoing*. See the xc_webrtc.js on https://gitlab.com/xivo.solutions/xucserver/blob/master/app/assets/ javascripts/xc_webrtc.js. The error state events contains a description in the reason field. Call establishment event contains *caller* or *callee* detail. Use the sample page to see some examples.

10.1.2 Rest API

General form

 $\label{eq:localhost:protect\T1\textdollarxucport/xuc/api/1.0\protect\T1\textdollarmethod\protect\T1\textdollarusername/$

withHeaders(("Content-Type", "application/json"))

- \$xucport : Xuc port number (default 8090)
- \$method : See available methods below
- \$domain : Represents a connection site, can be anything
- \$username : XiVO client user username

Events

Xuc post JSON formated events on URL eventUrl = "http://localhost:8090/xivo/ 1.0/event/avencall.com/dropbox/" configured in /usr/share/xuc/application.conf

Phone Event Notification

Related to a username, phone event is in message payload same structure as javascript Phone Events

```
{
    "username":"alicej",
    "message":{
        "msgType":"PhoneEvent",
        "ctiMessage":{"eventType":"EventDialing","DN":"1058","otherDN":"3000",
        "linkedId":"1447670380.34","uniqueId":"1447670380.34","userData":{"XIVO_USERID":
        →"9"}}}
```

Obtain authentication token

POST http://localhost:\protect\T1\textdollarxucport/xuc/api/2.0/auth/login

```
curl -XPOST -d '{"login": "<login>", "password": "<password>"}' -H "Content-Type:_

→application/json" http://localhost:8090/xuc/api/2.0/auth/login
```

Will retrieve an object

```
{login: "<login>", token: "<token>"}
```

or an error

```
{error:"<error_code>", message:"<error_message>"}
```

where error_code is one of:

- UserNotFound
- InvalidPassword
- InvalidJson
- UnhandledError

This token can then be used with the CTI Authentication and Check authentication token.

Obtain authentication token (SSO/Kerberos)

GET http://localhost:\protect\T1\textdollarxucport/xuc/api/2.0/auth/sso

```
curl -XGET http://localhost:8090/xuc/api/2.0/auth/sso
```

Will retrieve an object

{login: "<login>", token: "<token>"}

or an error

{error:"<error_code>", message:"<error_message>"}

where error_code is one of:

• UserNotFound

- SsoAuthenticationFailed
- UnhandledError

This token can then be used with the CTI Authentication and Check authentication token.

Check authentication token

You can check the validity of a token using the following web service with an Authorization header set to 'Bearer <token>'

GET http://localhost:\protect\T1\textdollarxucport/xuc/api/2.0/auth/check

```
curl -X GET -H "Authorization: Bearer eyJ0eXAiOiJKV1QiLCJhbGciOiJIUzI1NiJ9.

→eyJsb2dpbiI6InZtYWNoaW4iLCJleHBpcmVzIjoxNDg5OTk4Mzg2fQ.

→R6bzc5fBRs7417ZBdLVjSIbNx3j3e07mV6mAX4_skll" "http://localhost:8090/xuc/api/2.0/

→auth/check"
```

Will retrieve an object with a refreshed token

{login: "<login>", token: "<token>"}

or an error

{error:"<error_code>", message:"<error_message>"}

where error_code is one of:

- InvalidToken
- InvalidJson
- BearerNotFound
- AuthorizationHeaderNotFound
- TokenExpired
- UnhandledError

Connection

POST http://localhost:\protect\T1\textdollarxucport/xuc/api/1.0/connect\protect\T1\textdollardomain/protect\T1\textdollarusername/

```
{"password" : "password"}
```

DND

POST http://localhost:\protect\T1\textdollarxucport/xuc/api/1.0/dnd/\protect\T1\textdollardomain/ \protect\T1\textdollarusername/

Dial

POST http://localhost:\protect\T1\textdollarxucport/xuc/api/1.0/dial/\protect\T1\textdollardomain/ \protect\T1\textdollarusername/

DialByUsername

POST http://localhost:\protect\T1\textdollarxucport/xuc/api/1.0/dialByUsername/protect\T1\textdollardomain/protect\T1\textdollarusername/

{"username" : "john"}

curl -XPOST -d '{"username":"<username>"}' -H "Content-Type: application/json" http://localhost:8090/xuc/ api/1.0/dialByUsername/avencall.com/<username>/

DialFromQueue

POST http://localhost:\protect\T1\textdollarxucport/xuc/api/1.0/dialFromQueue/\protect\T1\textdollardomain/\protect\T1\textdollarusername/

```
{"destination":"1002","queueId":5,"callerIdName":"Thomas","callerIdNumber":"999999

o","variables":{"foo":"bar"}}
curl -XPOST -d '{"destination":"1002","queueId":5,"callerIdName":"Thomas",
o"callerIdNumber":"999999","variables":{"foo":"bar"}}' -H "Content-Type:__
oapplication/json" http://localhost:8090/xuc/api/1.0/dialFromQueue/avencall.com/
o<username>/
```

Limitations: Queue No Answer settings does not work - see *No Answer*. Except: when there is no free Agent to queue (none attached, all Agents on pause or busy), then No answer settings work (but Fail does not).

Note: Line should be configured with enabled "Ring instead of On-Hold Music" enabled (on "Application: tab in queue configuration - see *Queues*). Otherwise the queue will answers the call and the destination rings even if there are no agents available.

Phone number sanitization

Dial command automatically applies filters to the phone number provided to make it valid for Xivo. Especially, it removes invalid characters and handles properly different notations of international country code.

Some countries don't follow the international standard and actually keep the leading zero after the country code (e.g. Italy). Because of this, if the zero isn't surrounded by parenthesis, the filter keeps it^1 .

Forward

All forward commands use the above payload

```
{"state" : [true|false],
    "destination" : "1102")
```

¹ See Redmine ticket #150

Unconditionnal

POST http://localhost:\protect\T1\textdollarxucport/xuc/api/1.0/uncForward/protect\T1\textdollardomain/protect\T1\textdollarusername/

On No Answer

POST http://localhost:\protect\T1\textdollarxucport/xuc/api/1.0/naForward/protect\T1\textdollardomain/protect\T1\textdollarusername/

On Busy

POST http://localhost:\protect\T1\textdollarxucport/xuc/api/1.0/busyForward/\protect\T1\textdollardomain/protect\T1\textdollarusername/

Personal Contacts

To handle personal contacts of a user

Error management

If an error occurs while using API actions, error will always be raised with proper HTTP return code and will be wrapped in JSON object with following format

```
"error": <error_code>
"message": <cause>
}
```

Error codes

| Error code | HTTP header code | Possible cause |
|------------------|------------------|--|
| InvalidContact | 400 | Personal contact has bad format |
| ContactNotFound | 404 | Personal contact does not exist |
| DuplicateContact | 409 | Personal contact already exists |
| Unreachable | 503 | Directory server is not reachable |
| JsonParsingError | 500 | Personal Contact sent to API is not JSON valid |
| NotHandledError | 500 | Error not covered in current implementation |

List

GET http://localhost:\protect\T1\textdollarxucport/xuc/api/2.0/contact/personal

Will retrieve an object containing all personal contacts *entries* with associated values defined in *headers* (HTTP code 200)

```
"entries": [
    { "status": 0, "entry": [ "hawkeye", "pierce", "1002", "0761187406", "false
    ··"]},
    { "status": -2, "entry": [ "peter", "pan", "1004", "", "false"]}],
    "headers":
        ["Firstname", "Lastname", "Number", "Mobile", "Favorite"]
}
```

Get

GET http://localhost:\protect\T1\textdollarxucport/xuc/api/2.0/contact/personal/\protect\T1\ textdollarcontactId

Will retrieve an object containing a single personal contact (HTTP code 200)

```
{
   "id":"28079dc0-2c6b-4332-9075-61da9229389f",
   "firstname":"doe",
   "lastname":"john",
   "number":"1111",
   "mobile":"2222",
   "fax":"3333",
   "email":"j.doe@my.corp",
   "company":"corp"
}
```

Create

POST http://localhost:\protect\T1\textdollarxucport/xuc/api/2.0/contact/personal

```
{
    "firstname":"doe",
    "lastname":"john",
    "number":"1111",
    "mobile":"2222",
    "fax":"3333",
    "email":"j.doe@my.corp",
    "company":"corp"
}
```

Will create and return object containing a single personal contact with id (HTTP code 201)

```
{
   "id":"28079dc0-2c6b-4332-9075-61da9229389f",
   "firstname":"doe",
   "lastname":"john",
   "number":"1111",
   "mobile":"2222",
   "fax":"3333",
   "email":"j.doe@my.corp",
   "company":"corp"
}
```

Update

PUT http://localhost:\protect\T1\textdollarxucport/xuc/api/2.0/contact/personal/\protect\T1\textdollarcontactId

```
{
             "firstname":"doe",
           "lastname":"john",
            "number":"1111",
           "mobile":"2222",
            "fax":"3333",
             "email":"j.doe@my.corp",
             "company":"corp"
    }
curl -XPUT -H "Content-Type: application/json" -H "X-Auth-Token:
 →eyJ0eXAiOiJKV1QiLCJhbGciOiJIUzI1NiJ9.
 →eyJsb2dpbiI6InZtYWNoaW4iLCJleHBpcmVzIjoxNDg5OTk4Mzg2fQ.
 →R6bzc5fBRs7417ZBdLVjSIbNx3j3e07mV6mAX4_sklI" http://localhost:8090/xuc/api/2.0/
 →contact/personal/28079dc0-2c6b-4332-9075-61da9229389f -d '{"lastname":"john",

where the state of the s
```

Will update and return object containing single personal contact with id (HTTP code 200)

```
{
   "id":"28079dc0-2c6b-4332-9075-61da9229389f",
   "firstname":"doe",
   "lastname":"john",
   "number":"1111",
   "mobile":"2222",
   "fax":"3333",
   "email":"j.doe@my.corp",
   "company":"corp"
}
```

Delete

DELETE http://localhost:\protect\T1\textdollarxucport/xuc/api/2.0/contact/personal/\protect\T1\textdollarcontactId

Will return empty content (HTTP code 204)

Delete All

DELETE http://localhost:\protect\T1\textdollarxucport/xuc/api/2.0/contact/personal

Will return empty content (HTTP code 204)

Export

GET http://localhost:\protect\T1\textdollarxucport/xuc/api/2.0/contact/export/personal

Will return csv text content with UTF-8 encoding (HTTP code 200) containing all personal contacts of a user

```
company,email,fax,firstname,lastname,mobile,number
corp,jdoe@company.corp,3333,John,Doe,2222,1111
```

Import

POST http://localhost:\protect\T1\textdollarxucport/xuc/api/2.0/contact/import/personal

Note: request needs to have plain csv as content with utf-8 charset

Will create and return object containing result of success/failure for each personal contact inserted (HTTP code 201)

```
{
   "created": [{
    "id": "e62ee672-f74a-498c-b138-86ac1b0ae429",
    "lastname": "Wayne"
   }, {
        "id": "d3a67f8e-3d8a-465a-9633-bde65a41f1bb",
        "lastname": "Hawking"
   }],
   "failed": [{
        "line": 3,
        "errors": ["too many fields"]
   }]
}
```

Handshake

Will repost all events on the configured URL

POST http://localhost:\protect\T1\textdollarxucport/xuc/api/1.0/handshake/\protect\T1\ textdollardomain/

AgentLogout

Logout un agent

POST http://protect\T1\textdollarxuchost:\protect\T1\textdollarxucport/xuc/api/1.0/agentLogout/

TogglePause

Change state of an agent, pause if ready, ready if on pause or on wrapup

POST http://protect/T1/textdollarxuchost:/protect/T1/textdollarxucport/xuc/api/1.0/togglePause/

10.1.3 Real Time Statistics

Exposed by xuc

Queue statistics

These real time statistics are calculated nearly in real time from the queue_log table Statistic are reset to 0 at midnight (24h00) can be changed by configuration

| name | Description | | |
|-----------------------------|---|--|--|
| TotalNumberCallsEntered | Total number of calls entered in a queue | | |
| TotalNumberCallsAbandonned | Total number of calls abandoned in a queue (not answered) | | |
| TotalNumberCallsAban- | Total number of calls abandoned after 15 seconds | | |
| donnedAfter15 | | | |
| TotalNumberCallsAnswered | Total number of calls answered | | |
| TotalNumberCallsAnsweredBe- | Total number of calls answered before 15 seconds | | |
| fore15 | | | |
| PercentageAnsweredBefore15 | Percentage of calls answered before 15 seconds over total number of calls | | |
| | entered | | |
| PercentageAbandonnedAfter15 | Percentage of calls abandoned after 15 seconds over total number of calls | | |
| | entered | | |
| TotalNumberCallsClosed | Total number or calls received when queue is closed | | |
| TotalNumberCallsTimeout | Total number or calls diverted on queue timeout | | |

Real time calculated Queue statistic

All queue statistics counters (except percentage) are also available for the sliding last hour by adding LastHour to the name .i.e. TotalNumberCallsAbandonnedLastHour.

For percentage, there is no historical value (LastHour). If you need historical percentage, you should compute it using the historical total numbers.

Additional Thresholds

You can configure xuc to add statistics for thresholds other than 15 seconds. In this case the xuc server will automatically publish TotalNumberCallsAbandonnedAfterXX, TotalNumberCallsAnsweredBeforeXX, PercentageAbandonnedAfterXX. XX will be replace by all the defined thresholds values.

Configuration

You need to include in the compose.yml file a link to a specific configuration file by adding in xuc section a specific volume and an environment variable to specify the alternate config file location

```
xuc:
....
environment:
....
- CONFIG_FILE=/conf/xuc.conf
volumes:
- /etc/docker/xuc:/conf
```

Edit in /etc/docker/xuc/ a configuration file named xuc.conf to add new thresholds configuration (empty by default)

```
include "application.conf"
xucstats {
  queues {
    statTresholdsInSec = [10,30] # 15 sec treshold is automatically added
  }
}
```

Recreate and restart the container : xivocc-dcomp up -d xuc

Note: In this example, xuc will publish counters for 10, 15 and 30 seconds periods.

Other queue statistics

Other queue statistics are calculated by xivo cti server

- AvailableAgents
- TalkingAgents
- LongestWaitTime
- WaitingCalls
- EWT

Definition in xivo documentation xivo documentation

Calculated Agent statistics

| name | Description |
|----------------------|---|
| PausedTime | Total time agent in pause |
| WrapupTime | Total time agent in wraup |
| ReadyTime | Total time agent ready |
| InbCalls | Total number of inbound calls received internal and external |
| InbAcdCalls | Total number of inbound ACD calls received internal and external |
| InbCallTime | Total time for inbound calls received internal and external |
| InbAcdCallTime | Total time for inbound ACD calls received internal and external |
| InbAcdCallTime | Total time for inbound ACD calls received internal and external |
| InbAnsCalls | Answered inbound calls received internal and external |
| InbAnsAcdCalls | Answered inbound ACD calls received internal and external |
| InbUnansCalls | Unanswered inbound calls received internal and external |
| InbUnansAcdCalls | Unanswered inbound ACD calls received internal and external |
| InbPercUnansCalls | Percentage of unanswered inbound calls received internal and external |
| InbPercUnansAcdCalls | Percentage of unanswered inbound ACD calls received internal and external |
| InbAverCallTime | Average time for inbound calls received internal and external |
| InbAverAcdCallTime | Average time for inbound ACD calls received internal and external |
| OutCalls | Total number of outbound calls received internal and external |
| LoginDateTime | Last login date time |
| LogoutDateTime | Last logout date time |

Terms:

inbound ACD calls all calls received by an agent via ACD.

inbound calls all calls received by an agent, internal, external or ACD calls.

oubound calls all calls dialed by an agent, internal or external calls.

Agent statistics are calculated internaly on a daily basis and reset to 0 at midnight (default configuration). see javascript api

If some status are configured in xivo cti server with activate pause to all queue = true, additionnal statistics computing the total time in not ready with this status are calculated. This statistics name is equal to the presence name configuration in XiVO.

10.1.4 Technical structure of XiVO-CC

Reporting

The reporting is composed of four packages: pack-reporting, xivo-full-stats, xivo-reporting-db and xivo-db replication.

These packages will feed the tables of the xivo_stats database:

- xivo-db-replication feeds the tables cel and queue_log in real time, and the configuration tables (dialaction, linefeatures, etc...) every 5 minutes
- xivo-full-stats feeds in real time tha tables call_on_queue, call_data, stat_queue_periodic, stat_agent_periodic and agent_position
- xivo-reporting-db and pack-reporting work together to feed the tables stat_queue_specific, stat_agent_queue_specific and stat_agent_specific every 15 minutes

10.2 Third Party Integration

Third party web application integration is possible inside the XucMgt Agent application. Upon each call, you can display a custom panel next to the agent interface:

10.2.1 Workflow

When a call is ringing on the agent phone, the Application will call the external web service (see *Configuration* below). The web service response will dictate the behaviour of the integration. For example, if the speficied action is to open the application when the call is hung up, a new panel will be created and opened inside the agent interface, showing the content specified by the web service response. (see *Web Service API* for available options).

When the work is complete in the integrated application, the application must post a message to terminate the third party application pane inside the agent application (see *Completion*).

10.2.2 Configuration

You need to specify the third party application web service url to integrate this application inside the XucMgt Agent interface. This can be done by giving a value to the THIRD_PARTY_URL environment variable in the /etc/docker/compose/custom.env file

```
THIRD_PARTY_URL=http://some.url.com/ws/endpoint
```

The speficied URL must be accessible from the client browser (i.e. the end user of the Agent application). The call wil be made from his browser.

10.2.3 Web Service API

The Web Service url specified in the : Configuration must conforms to the following behaviour.

The service will receive a POST request with a payload as application/json, for example:

```
{
    "user":{
        "userId":4,
        "agentId":1,
        "firstName":"James",
        "lastName":"Bond",
        "fullName":"James Bond"
```

| | Third P | arty Sample | |
|-------------|----------|-----------------|-------|
| Data table | Raw data | | Close |
| Property | | Value | |
| Call | | | |
| From | | "1101" | |
| То | | "1100" | |
| Queue | | | |
| id | | 1 | |
| name | | "support" | |
| displayName | | "support" | |
| number | | "3000" | |
| User | | | |
| agentid | | 3 | |
| fullName | | "César Brideau" | |
| lastName | | "Brideau" | |
| firstName | | "César" | |
| userId | | 7 | |
| User Data | | | |
| XIVO_USERI |) | "10" | |

| César Brideau | | | Third Party Sample |
|---------------------------|--------------------|-------------|--------------------|
| Paused - 04:04 | € 1100 | Data table | Raw data Close |
| < 🖓 00:00:00 | 00:00:00 > | Property | Value |
| 9 😑 😐 | | Call | |
| History Activities Agents | Callbacks Customer | From | "1101" |
| SEARCH OR CA | ALL Q | То | "1100" |
| | | Queue | |
| NAME - My activities | SUBS. \$ STAT. \$ | id | 1 |
| big long queue name | | name | "support" |
| sales | • × ≣ | displayName | "support" |
| support | • • ≡ | number | "3000" |
| Switchboard | × 🔳 | User | |
| Switchboard_hold | > × ≣ | agentid | 3 |
| | | fullName | "César Brideau" |
| | | lastName | "Brideau" |
| | | firstName | "César" |
| | | userId | 7 |
| | | User Data | |
| | | XIVO_USERID | D "10" |
| | | | |
| | | | |

```
}.
    "callee":"1000",
    "caller":"1001",
    "queue":{
        "id":2,
        "name":"trucks",
        "displayName":"Trucks",
        "number":"3001"
    },
    "userData":{
        "XIVO CONTEXT":"default",
        "XIVO_USERID":"2",
        "XIVO_SRCNUM":"1001",
        "XIVO_DSTNUM":"3001"
   }
}
```

- user contains the connected user information
- callee contains the number called
- queue queue properties
- userData call data presented by Xivo

The Web service must answer with an application/json content. For example:

```
{
    "action":"open",
    "event":"EventReleased",
    "url":"/thirdparty/open/6bd37819-b4a6-43d3-8fa3-6eb6489bb705",
    "autopause":true,
    "title":"Third Party Sample"
}
```

or:

{

}

```
"action":"none"
```

- action is one of "open" or "none"
- event is one of "EventRinging", "EventEstablished", "EventReleased". The third party application will be opened when one the specified event occurs
- url should be the url to open inside the application. This url should point to a valid web application that can be specific for each call.
- autopause if set to true, the agent will be put on pause when the application pane is opened and back to ready when the application is completed.
- title will set the title of the tabs that will be opened.

Warning, when the XucMgt application and the integrated application are on different server, domain, url,... (which should be common case), You may get CORS errors. To workaround this issue, you should implement the OPTIONS request on your web service. This method will be called by the browser before issuing the POST request to ensure the target web server allows calls from the original application. You application must set at least the following headers in order to overcome the CORS errors:

- Access-Control-Allow-Origin: * or the domain hosting the XucMgt application
- Access-Control-Allow-Methods: POST, OPTIONS (at least)
- Access-Control-Allow-Headers: Origin, X-Requested-With, Content-Type, Accept (at least)

10.2.4 Completion

Once the work is complete inside the third party application, it should post a completion message (closeThirdParty) to the application using the Web Messaging API.

For example, here is how to define a close method in javascript to send the message to the hosting application and bind it to a simple button:

```
(function () {
    function close() {
        parent.window.postMessage("closeThirdParty", "*");
    }
    document.getElementById("close").addEventListener("click", close, false);
})();
```

10.3 Recording server REST Api

This section describes the Recording server API.

In the following, all url are relative to the recording server base url and port. For example a relative URL / records/search is meant to be replaced by http://192.168.29.101:9400/records/search assuming the recording server is available on port 9400 at 192.168.29.101

10.3.1 Authentication

To use the recording api you need to add an additional header in the HTTP Request. The header name is X-Auth-Token and its value must be the same as the authentication.token value in the application.conf of the recording server.

Example:

```
curl -XPOST -H "Content-Type: application/json" -H "Accept: application/json"
        -H 'X-Auth-Token: u@pf#41[gYHJm<]9N[a0iWDQQ7`e9k' http://192.168.29.
        →101:9400/records/search?pageSize=3 -d '{"agent": "1573"}'
```

10.3.2 Records

Search

This api allows to search for recorded calls in the database using criteria.

Description:

```
\boldsymbol{URL}\xspace /records/search
```

 $Method \ {\tt POST}$

Url parameters

page The page number to return, counting from 1

pageSize The number of elements per page

Request body Json object with field & value pair.

Allowed field names:

agent The agent number to filter on

queue The queue number to filter on
start Return only calls starting or ending after the given value
end Return only calls starting before the given value
callee Return only calls with the given destination number
caller Return only calls with the give source number
direction Filter calls based on the call direction, one of incoming, outgoing or all
key filter based on the given key name in the attached data along with the value of the value field
value value of the key defined in the key field

Example

Query:

Response:

```
{
   "hasNext": true,
   "records": [
        {
            "agent": "Joe Dalton (1573)",
            "attached_data": {
                "recording": "xivocc_gateway-1459433866.13971"
            },
            "dst_num": "73555",
            "duration": "00:00:20",
            "id": "xivocc_gateway-1459433866.13971",
            "queue": "oneforone (3555)",
            "src_num": "loadtester",
            "start": "2016-03-31 16:17:46",
            "status": "answered"
        },
        {
            "agent": "Joe Dalton (1573)",
            "attached_data": {
                "recording": "xivocc_gateway-1459433330.13665"
            },
            "dst_num": "73555",
            "duration": "00:01:01",
            "id": "xivocc_gateway-1459433330.13665",
            "queue": "oneforone (3555)",
            "src_num": "loadtester",
            "start": "2016-03-31 16:08:51",
            "status": "answered"
        }
   ]
```

Search by call id

This api allows to search for a recorded call based on call id.

Description:

URL /records/callid_search

 $Method \ {\tt POST}$

Url parameters

callid The call id to retrieve

Example Query:

Response:

```
{
   "hasNext": false,
   "records": [
        {
            "agent": "Dino Falconetti (1564)",
            "attached_data": {
                "recording": "xivocc_gateway-1459435465.15089"
            },
            "dst_num": "73556",
            "duration": "",
            "id": "xivocc_gateway-1459435465.15089",
            "queue": "hotline (3556)",
            "src_num": "loadtester",
            "start": "2016-03-31 16:44:26",
            "status": "answered"
        }
   ]
```

Retrieve audio file

This api allows to retrieve an audio file of a give call.

Description:

URL /records/records/<file-id>/audio

Method GET

Url parameters

file-ud The file to retrieve

Example:

```
curl -XGET -H "Accept: application/json" -H 'X-Auth-Token: u@pf#41[gYHJm

→<]9N[a0iWDQQ7`e9k'

http://192.168.29.101:9400/records/xivocc_gateway-1459435465.15089/audio
```

Attach call data

This api allows to attach data to a given call

Description:

URL /call_data/<call-data-id>/attached_data

Method POST

Url parameters

call-data-id The id of the call-data, not to be confused by the call id or unique id.

Request Body An array of key value

Example:

```
curl -XPOST -H "Content-Type: application/json" -H "Accept: application/json" -H

→ 'X-Auth-Token: u@pf#41[gYHJm<]9N[a0iWDQQ7`e9k'

http://192.168.29.101:9400/call_data/761054/attached_data -d '[{"key":

→ "color", "value": "green"}]'
```

10.3.3 History

Search

This api gives the call history of a given interface.

Description:

 \boldsymbol{URL} /history

Method POST

Url parameters

size The maximum number of result to return

Request Body A json object with a field named interface containing the interface to search for.

Example Query:

```
curl -XPOST -H "Content-Type: application/json" -H "Accept: application/json" -H

→ 'X-Auth-Token: u@pf#41[gYHJm<]9N[a0iWDQQ7`e9k' http://localhost:9400/history -d

→ '{"interface":"SIP/az9kf7"}'
```

Response:

Γ

```
{
    "start": "2017-01-27 15:37:54",
    "duration": "00:00:18",
    "src_num": "1001",
    "dst_num": "3000",
    "status": "emitted",
    "src_firstname": "Poste",
    "src_lastname": "Poste 1001",
    "dst_firstname": null,
    "dst_lastname": "Cars"
}
```

Search by customer

This api helps to find call history of a customer thanks to a list of predefined filters.

Description:

URL /history/customer

Method POST

- **Request Body** A json object with filters (optional) named filters containing the customer to search for and size to limit the results returned.
- **Response** total the number of call received by this customer, list the call details reduced to the size set in query.

A filter is composed of a field as key (basically column name), an operator (=, <, >) and a value.

Allowed filter field:

src_num The customer phone number

key Call Attached data key

value Call Attached data value

Example Query:

```
curl -XPOST -H "Content-Type: application/json" -H "Accept: application/json" -H

→ 'X-Auth-Token: u@pf#41[gYHJm<]9N[a0iWDQQ7`e9k'

http://localhost:9400/history/customer -d '{"filters": [{"field":"src_num",

→ "operator": "=", "value": "1456"}], "size":2}'
```

Response:

```
"total":11,
"list":[
    {"start":"2017-06-13 17:32:45","duration":"00:00:08",
    "wait_time":"00:00:06","agent_name":"Brucé Waill",
    "agent_num":"2500","queue_name":"Bl Record",
    "queue_num":"3012","status":"answered"},
    {"start":"2017-06-13 17:26:54","duration":"00:00:06",
    "wait_time":"00:00:05","agent_name":"Brucé Waill",
    "agent_num":"2500","queue_name":"Blue Ocean",
    "queue_num":"3000","status":"answered"
    }
]
```

Last agent for number

This api retrieves the last agent id who answered a given caller number.

Description:

URL /last_agent

 $Method \ {\tt GET}$

Url parameters

callerNo The calling number

since The number of days to search in the history

Example Query:

```
curl -XGET -H "Content-Type: application/json" -H "Accept: application/json" -H 'X-

→Auth-Token: u@pf#41[gYHJm<]9N[a0iWDQQ7`e9k' 'http://localhost:9400/last_agent?

→callerNo=1002&since=100'
```

Response:

```
{"agentNumber":"2000"}
```

10.4 XiVO REST API

The XiVO REST APIs are the privileged way to programmatically interact with XiVO.

10.4.1 Reference

xivo-agentd REST API

You can view the API documentation at http://<youxivo>.api.

Changelog

15.19

• Token authentication is now required for all routes, i.e. it is not possible to interact with xivo-agentd without a xivo-auth authentication token.

15.18

• xivo-agentd now uses HTTPS instead of HTTP.

15.15

- The resources returning agent statuses, i.e.:
 - GET /agents
 - GET /agents/by-id/{agent_id}
 - GET /agents/by-number/{agent_number}

are now returning an additional argument named "state_interface", which is "the interface (e.g. SIP/alice) that is used to determine if an agent is in use or not".

xivo-confd REST API

Note: REST API 1.1 for confd is currently evolving. New features and small fixes are regularly being added over time. We invite the reader to periodically check the *changelog* for an update on new features and changes.

xivo-confd REST API changelog

16.06

- A new API for initializing a XiVO (passing the wizard):
 - GET /1.1/wizard
 - POST /1.1/wizard
 - GET /1.1/wizard/discover
- A new API for associating a user with an entity has been added:
 - GET /1.1/users/<user_id>/entities
 - PUT /1.1/users/<user_id>/entities/<entity_id>

16.05

- A new API for associating a user with a call permission has been added:
 - GET /1.1/users/<user_id>/callpermissions
 - PUT /1.1/users/<user_id>/callpermissions/<call_permission_id>
 - DELETE /1.1/users/<user_id>/callpermissions/<call_permission_id>
 - GET /1.1/callpermissions/<call_permission_id>/users
- Two new parameters have been added to the users resource:
 - call_permission_password
 - enabled
- A new API for user's forwards has been added:
 - PUT /1.1/users/<user_id>/forwards
- SIP endpoint: allow and disallow options are not split into multiple options anymore.
- SCCP endpoint: allow and disallow options are not split into multiple options anymore.

16.04

- The summary view has been added to /users (GET /users?view=summary)
- A new API for user's services has been added:
 - GET /1.1/users/<user_id>/services
 - GET /1.1/users/<user_id>/services/<service_name>
 - PUT /1.1/users/<user_id>/services/<service_name>
- A new API for user's forwards has been added:
 - GET /1.1/users/<user_id>/forwards
 - GET /1.1/users/<user_id>/forwards/<forward_name>
 - PUT /1.1/users/<user_id>/forwards/<forward_name>
- GET /1.1/users/export now requires the following header for CSV output:

Accept: text/csv; charset=utf-8

• Added call permissions endpoints:

- GET /1.1/callpermissions
- POST /1.1/callpermissions
- GET /1.1/callpermissions/<callpermission_id>
- PUT /1.1/callpermissions/<callpermission_id>
- DELETE /1.1/callpermissions/<callpermission_id>

16.03

- Added switchboard endpoints:
 - GET /1.1/switchboards
 - GET /1.1/switchboards/<switchboard_id>/stats
- A new API for associating a line with a device has been added:
 - PUT /1.1/lines/<line_id>/devices/<device_id>
 - DELETE /1.1/lines/<line_id>/devices/<device_id>
- The following URLs have been deleted. Please use the new API instead:
 - GET /1.1/devices/<device_id>/associate_line/<line_id>
 - GET /1.1/devices/<device_id>/dissociate_line/<line_id>

16.02

- Added users endpoints in REST API:
 - GET /1.1/users/<user_uuid>/lines/main/associated/endpoints/sip

16.01

- The SIP API has been improved. options now accepts any extra parameter. However, due to certain database limitations, parameters that appear in *Supported parameters on SIP endpoints* may only appear once in the list. This limitation will be removed in future versions.
- A new API for custom endpoints has been added: /1.1/endpoints/custom
- A new API for associating custom endpoints has been added: /1.1/lines/<line_id>/ endpoints/custom/<endpoint_id>

15.20

- A new API for mass updating users has been added: PUT /1.1/users/import
- A new API for exporting users has been added: GET /1.1/users/export

15.19

- A new API for mass importing users has been added: POST /1.1/users/import
- The following fields have been added to the /users API:
 - supervision_enabled
 - call_tranfer_enabled

- ring_seconds
- simultaneous_calls

15.18

- Ports 50050 and 50051 have been removed. Please use 9486 and 9487 instead
- Added sccp endpoints in REST API:
 - GET /1.1/endpoints/sccp
 - POST /1.1/endpoints/sccp
 - DELETE /1.1/endpoints/sccp/<sccp_id>
 - GET /1.1/endpoints/sccp/<sccp_id>
 - PUT /1.1/endpoints/sccp/<sccp_id>
 - GET /1.1/endpoints/sccp/<sccp_id>/lines
 - GET /1.1/lines/<line_id>/endpoints/sccp
 - DELETE /1.1/lines/<line_id>/endpoints/sccp/<sccp_id>
 - PUT /1.1/lines/<line_id>/endpoints/sccp/<sccp_id>
- Added lines endpoints in REST API:
 - GET /1.1/lines/<line_id>/users

15.17

- A new API for SIP endpoints has been added. Consult the documentation on http://xivo/api/ for further details.
- The /lines_sip API has been deprecated. Please use /lines and /endpoints/sip instead.
- Due to certain limitations in the database, only a limited number of optional parameters can be configured. This limitation will be removed in future releases. Supported parameters are listed further down.
- Certain fields in the /lines API have been modified. List of fields are further down

Fields modified in the /lines API

| Name | Replaced by | Editable ? | Required ? |
|------------------------|-------------------|------------|------------|
| id | | no | |
| device_id | | no | |
| name | | no | |
| protocol | | no | |
| device_slot | position | no | |
| provisioning_extension | provisioning_code | no | |
| context | | yes | yes |
| provisioning_code | | yes | |
| position | | yes | |
| caller_id_name | | yes | |
| caller_id_num | | yes | |

Supported parameters on SIP endpoints

- md5secret
- language
- accountcode
- amaflags
- allowtransfer
- fromuser
- fromdomain
- subscribemwi
- buggymwi
- call-limit
- callerid
- fullname
- cid-number
- maxcallbitrate
- insecure
- nat
- promiscredir
- usereqphone
- videosupport
- trustrpid
- sendrpid
- allowsubscribe
- allowoverlap
- dtmfmode
- rfc2833compensate
- qualify
- g726nonstandard
- disallow
- allow
- autoframing
- mohinterpret
- useclientcode
- progressinband
- t38pt-udptl
- t38pt-usertpsource
- rtptimeout
- rtpholdtimeout

- rtpkeepalive
- deny
- permit
- defaultip
- setvar
- port
- regexten
- subscribecontext
- fullcontact
- vmexten
- callingpres
- ipaddr
- regseconds
- regserver
- lastms
- parkinglot
- protocol
- outboundproxy
- transport
- remotesecret
- directmedia
- callcounter
- busylevel
- ignoresdpversion
- session-timers
- session-expires
- session-minse
- session-refresher
- callbackextension
- timert1
- timerb
- qualifyfreq
- contactpermit
- contactdeny
- unsolicited_mailbox
- use-q850-reason
- encryption
- snom-aoc-enabled
- maxforwards

- disallowed-methods
- textsupport

15.16

- The parameter skip is now deprecated. Use offset instead for:
 - GET /1.1/devices
 - GET /1.1/extensions
 - GET /1.1/voicemails
 - GET /1.1/users
- The users resource can be referred to by uuid
 - GET /1.1/users/<uuid>
 - PUT /1.1/users/<uuid>
 - DELETE /1.1/users/<uuid>

15.15

- The field enabled has been added to the voicemail model
- A line is no longer required when associating a voicemail with a user
- · Voicemails can now be edited even when they are associated to a user

15.14

- All optional fields on a user are now always null (sometimes they were empty strings)
- The caller id is no longer automatically updated when the firstname or lastname is modified. You must update the caller id yourself if you modify the user's name.
- Caller id will be generated if and only if it does not exist when creating a user.

14.16

- Association user-voicemail, when associating a voicemail whose id does not exist:
 - before: error 404
 - after: error 400

14.14

• Association line-extension, a same extension can not be associated to multiple lines

14.13

• Resource line, field provisioning_extension: type changed from int to string

REST API 1.1 examples

Create User for a line and a exten

Add user, line and exten with association

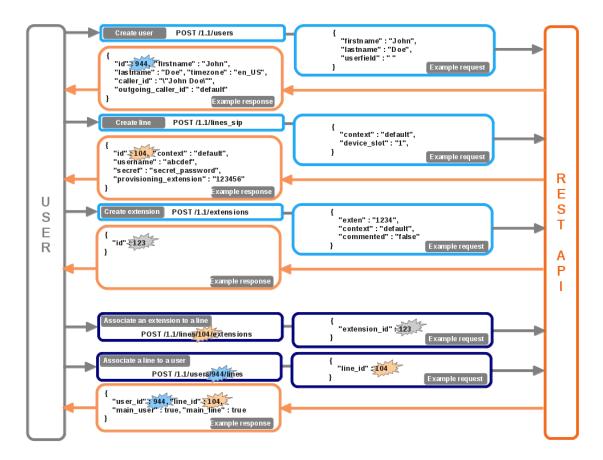

Fig. 10.1: Download source. (source)

Add voicemail with association

Choice and add CTI profile with association

Multiple users for a line association

API reference

This section contains extended documentation for certain aspects of the API.

Function Keys

Function keys can be used as shortcuts for dialing a number, or accomplishing other menial tasks, by pushing a button on the phone. A function key's action is determined by its destination.

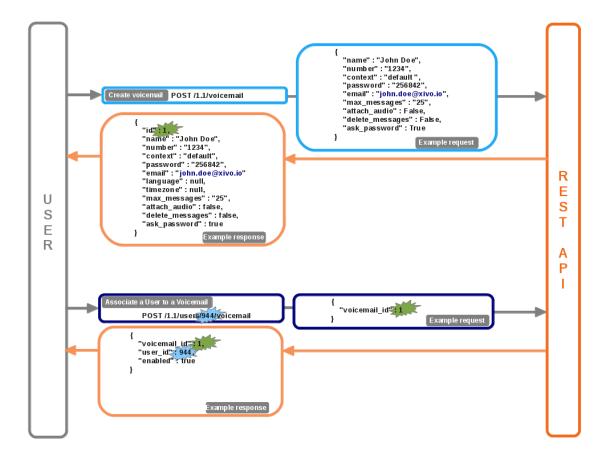

Fig. 10.2: Download source. (source)

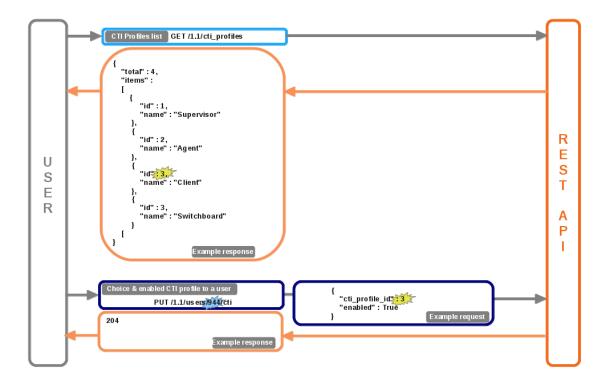

Fig. 10.3: Download source. (source)

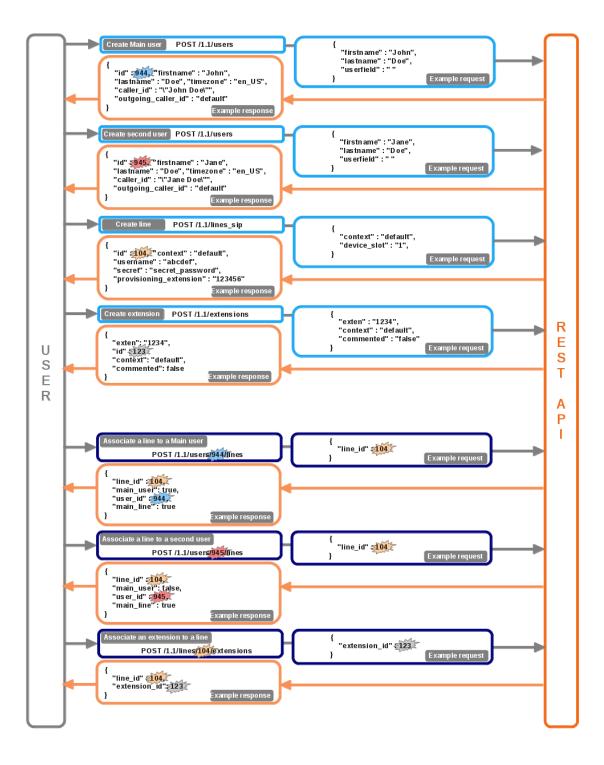

Fig. 10.4: Download source. (source)

Function keys can be added directly on a user, or in a template. Templates are useful for creating a set of common function keys that can be used by the same group of people.

This page only describes the data models used by the REST API. Consult the API documentation for further details on URLs.

Function Key Template

Parameters

| Field | Туре | Re- | Description | |
|-------|----------|--------|---|--|
| | | quired | | |
| name | string | No | A name for the template. | |
| keys | Function | No | A collection of function keys under the form {"position": | |
| | Key | | "funckey" }. See the example for more details. | |

Example

```
{
   "name": "Example template",
   "keys": {
        "1": {
            "destination": {
                 "type": "user",
                 "user_id": 34
             }
         },
         "2": {
             "blf": true,
             "label": "Call mom",
             "destination": {
                 "type": "custom",
                 "exten": "5551234567"
             }
         }
    }
}
```

Function Key

Description

| Field | Туре | Required | Description |
|-------------|-------------|----------|---|
| blf | boolean | No | Turn on BLF when there is activity on the destination |
| label | string | No | Label to display next to the function key |
| destination | Destination | Yes | Destination to call |

Example

```
{
    "blf": True,
    "label": "Call john",
```

```
"destination": {
    "type": "user",
    "user_id": 34
  }
}
```

Destination

A destination determines the number to dial when using a function key. Destinations are composed of a parameter named type and any additional parameters required by its type.

Available destination types:

agent An agent

bsfilter Boss/Secretary filter

conference Conference room

custom A custom number to dial

forward Forward a call towards another number

group A group

onlinerec Record a conversation during a call

paging A paging

park Park a call

park_position Pick up a parked call

queue Call queue

service A call service

transfer Transfer a call

user A User

Here are the parameters required for each destination:

Agent

| Field | Туре | Value |
|----------|---------|-------------|
| agent_id | numeric | Agents's id |

BSFilter

| Field | Туре | Value |
|------------------|---------|-------------------------|
| filter_member_id | numeric | ID of the filter member |

Conference

| Field | Туре | Value |
|---------------|---------|-----------------|
| conference_id | numeric | Conference's id |

Custom

| Field | Туре | Value |
|-------|--------|----------------|
| exten | string | Number to dial |

Forward

| Field | Туре | Value |
|---------|--------|---|
| forward | string | Type of forward. Possible values: busy, noanswer, unconditional |
| exten | string | Number to dial (optional) |

Group

| Field | Туре | Value |
|----------|---------|------------|
| group_id | numeric | Group's id |

Online call recording

No parameters are required for this destination

Paging

| Field | Туре | Value |
|-----------|---------|--------------|
| paging_id | numeric | Pagings's id |

Parking

No parameters are required for this destination

Parking Position

| Field | Туре | Value |
|----------|----------------|------------------------------------|
| position | numeric string | Position of the parking to pick up |

Queue

| Field | Туре | Value |
|----------|---------|-----------|
| queue_id | numeric | User's id |

Service

| | Field | Туре | Value | | |
|--|-----------|--------|---------------------|--|--|
| | service | string | Name of the service | | |
| | | | | | |
| Currently supported services: | | | | | |
| phonestatus Phone Status | | | | | |
| recsnd Sound Recording | | | | | |
| callrecord Call recording | | | | | |
| incallfilter Incoming call filtering | | | | | |
| enablednd Enable "Do not disturb" mode | | | | | |
| pickup Group Interception | | | | | |
| calllistening Listen to online calls | | | | | |
| directoryaccess Directory access | | | | | |
| fwdundoall Disable all forwaring | | | | | |
| enablevm Enable Voicemail | | | | | |
| vmusermsg Consult the Voicemail | | | | | |
| vmuserpurge Delete messages fro | m voicema | ail | | | |

Transfer

| Field | Туре | Value |
|----------|--------|--|
| transfer | string | Type of transfer. Possible values: blind, attended |

User

| Field | Туре | Value |
|---------|---------|-----------|
| user_id | numeric | User's id |

CSV User Import

Users and common related resources can be imported onto a XiVO server by sending a CSV file with a predefined *set of fields*.

This page only documents additional notes useful for API users.

Uploading files

Files may be uploaded as usual through the web interface, or from a console by using HTTP utilities and the REST API. When uploading through the API, the header *Content-Type: text/csv charset=utf-8* must be set and the CSV data must be sent in the body of the request. A file may be uploaded using *curl* as follows:

```
curl -k -H "Content-Type: text/csv; charset=utf-8" -u username:password --data-

→binary "@file.csv" https://xivo:9486/1.1/users/import
```

The response can be reindented in a more readable format by piping the output through *python -m json.tool* in the following way:

curl (...) | python -m json.tool

Migration from 1.0

The API version 1.0 is no longer supported and has been removed. In most cases, code that used the old API can be migrated to version 1.1 without much hassle by updating the URL. For example, in 1.0, the URL to list users was:

/1.0/users/ In 1.1, it **is::** /1.1/users

Please note that there are no trailing slashes in URLs for version 1.1.

For further details consult the documentation at http://<youxivo>.api

xivo-provd REST API

This section describes the REST API provided by the xivo-provd application.

If you want to interact with the REST API of the xivo-provd daemon that is executing as part of XiVO, you should be careful on which operation you are doing as to not cause stability problem to other parts of the XiVO ecosystem. Mostly, this means being careful when editing or deleting devices and configs.

By default, the REST API of xivo-provd is accessible only from localhost on port 8666. No authentication is required.

Warning: Major changes could happen to this API.

API

The description of the API has been split into these sections:

Provd Management

Get the Provd Manager

The provd manager resource represents the main entry point to the xivo-provd REST API.

It links to the following resources:

- The dev relation links to a *device manager*.
- The cfg relation links to a *config manager*.
- The pg relation links to a *plugin manager*.
- The srv. configure relation links to the provd manager *configuration service*.

Query

GET /provd HTTP/1.1

Example request

```
GET /provd HTTP/1.1
Host: xivoserver
Accept: application/vnd.proformatique.provd+json
```

Example response

```
HTTP/1.1 200 OK
Content-Type: application/vnd.proformatique.provd+json
{
    "links": [
        {
            "href": "/provd/dev_mgr",
            "rel": "dev"
        },
        {
            "href": "/provd/cfg_mgr",
            "rel": "cfg"
        },
        {
            "href": "/provd/pg_mgr",
            "rel": "pg"
        },
        {
            "href": "/provd/configure",
            "rel": "srv.configure"
        }
    ]
```

Devices Management

Get the Device Manager

The device manager links to the following resources:

- The dev.synchronize relation links to the device synchronization service.
- The dev. reconfigure relation links to the device reconfiguration service.
- The dev. dhcpinfo relation links to the device DHCP information service.
- The dev. devices relation links to the *list of devices*.

Query

GET /provd/dev_mgr HTTP/1.1

Example request

```
GET /provd/dev_mgr HTTP/1.1
Host: xivoserver
Accept: application/vnd.proformatique.provd+json
```

Example response

```
HTTP/1.1 200 OK
Content-Type: application/vnd.proformatique.provd+json
{
    "links": [
        {
            "href": "/provd/dev_mgr/synchronize",
            "rel": "dev.synchronize"
        },
        {
            "href": "/provd/dev_mgr/reconfigure",
            "rel": "dev.reconfigure"
        },
        {
            "href": "/provd/dev_mgr/dhcpinfo",
            "rel": "dev.dhcpinfo"
        },
        {
            "href": "/provd/dev_mgr/devices",
            "rel": "dev.devices"
        }
    ]
}
```

List Devices

Query

GET /provd/dev_mgr/devices HTTP/1.1

Query Parameters

| Field | Description | | |
|---------|--|--|--|
| q | A selector, encoded in JSON, describing which device should be returned. All devices are returned if | | |
| | not specified. Example: q={ "ip": "10.34.1.119" } | | |
| fields | A list of fields, separated by comma. Example: fields=mac, ip | | |
| skip | An integer specifing the number of devices to skip. Example: skip=10 | | |
| sort | The key on which to sort the results. Example: sort=id | | |
| sort_or | sort_ordThe order of sort; either ASC or DESC. | | |

```
GET /provd/dev_mgr/devices HTTP/1.1
Host: xivoserver
Accept: application/vnd.proformatique.provd+json
```

Example response

```
HTTP/1.1 200 OK
Content-Type: application/vnd.proformatique.provd+json
{
    "devices": [
        {
            "added": "auto",
            "config": "38e5e08ffe804b468f5aa53b9536bb25",
            "configured": true,
            "description": "",
            "id": "38e5e08ffe804b468f5aa53b9536bb25",
            "ip": "10.34.1.122",
            "mac": "00:08:5d:33:e5:76",
            "model": "6731i",
            "plugin": "xivo-aastra-3.3.1-SP2",
            "remote_state_sip_username": "je5qtq",
            "vendor": "Aastra",
            "version": "3.3.1.2235"
        }
    ]
}
```

Create a Device

Query

POST /provd/dev_mgr/devices HTTP/1.1

Example request

```
POST /provd/dev_mgr/devices HTTP/1.1
Host: xivoserver
Content-Type: application/vnd.proformatique.provd+json
{
    "device": {
        "ip": "192.168.1.1",
        "mac": "00:11:22:33:44:55",
        "plugin": "xivo-aastra-3.3.1-SP2"
    }
}
```

```
HTTP/1.1 201 Created
Content-Type: application/vnd.proformatique.provd+json
Location: /provd/dev_mgr/devices/68b10c99945b4fb889f22a7559fc3271
```

{"id": "68b10c99945b4fb889f22a7559fc3271"}

If the id field is not given, then an ID is automatically generated by the server.

Get a Device

Query

GET /provd/dev_mgr/devices/<device_id> HTTP/1.1

Example request

```
GET /provd/dev_mgr/devices/68b10c99945b4fb889f22a7559fc3271 HTTP/1.1
Host: xivoserver
Accept: application/vnd.proformatique.provd+json
```

Example response

```
HTTP/1.1 200 OK
Content-Type: application/vnd.proformatique.provd+json
{
    "device": {
        "added": "auto",
        "config": "38e5e08ffe804b468f5aa53b9536bb25",
        "configured": true,
        "description": "",
        "id": "38e5e08ffe804b468f5aa53b9536bb25",
        "ip": "10.34.1.122",
        "mac": "00:08:5d:33:e5:76",
        "model": "6731i",
        "plugin": "xivo-aastra-3.3.1-SP2",
        "remote_state_sip_username": "je5qtq",
        "vendor": "Aastra",
        "version": "3.3.1.2235"
    }
}
```

Update a Device

Query

PUT /provd/dev_mgr/devices/<device_id> HTTP/1.1

```
PUT /provd/dev_mgr/devices/68b10c99945b4fb889f22a7559fc3271 HTTP/1.1
Host: xivoserver
Content-Type: application/vnd.proformatique.provd+json
```

```
'
"device": {
    "added": "auto",
    "config": "38e5e08ffe804b468f5aa53b9536bb25",
    "configured": true,
    "description": "",
    "id": "38e5e08ffe804b468f5aa53b9536bb25",
    "ip": "10.34.1.122",
    "mac": "00:08:5d:33:e5:76",
    "model": "6731i",
    "plugin": "xivo-aastra-3.4",
    "remote_state_sip_username": "je5qtq",
    "version": "3.3.1.2235"
}
```

Example response

HTTP/1.1 204 No Content

Delete a Device

Query

DELETE /provd/dev_mgr/devices/<device_id> HTTP/1.1

Example request

```
DELETE /provd/dev_mgr/devices/68b10c99945b4fb889f22a7559fc3271 HTTP/1.1
Host: xivoserver
```

Example response

HTTP/1.1 204 No Content

Synchronize a Device

Query

POST /provd/dev_mgr/synchronize HTTP/1.1

```
POST /provd/dev_mgr/synchronize HTTP/1.1
Host: xivoserver
Content-Type: application/vnd.proformatique.provd+json
```

"id": "d035bccaf0dd4a8396fc57a3329ca0a4"

Example response

```
HTTP/1.1 201 Created
Location: /provd/dev_mgr/synchronize/42
```

The URI returned in the Location header points to an operation in progress resource.

Reconfigure a Device

Query

{

}

POST /provd/dev_mgr/reconfigure HTTP/1.1

Errors

| Error code | Error message | Description |
|------------|-------------------|-------------|
| 400 | invalid device ID | |

Example request

```
POST /provd/dev_mgr/reconfigure HTTP/1.1
Host: xivoserver
Content-Type: application/vnd.proformatique.provd+json
{
    "id": "d035bccaf0dd4a8396fc57a3329ca0a4"
}
```

Example response

HTTP/1.1 204 No Content

Push DHCP Request Information

Query

```
POST /provd/dev_mgr/dhcpinfo HTTP/1.1
```

```
POST /provd/dev_mgr/dhcpinfo HTTP/1.1
Host: xivoserver
Content-Type: application/vnd.proformatique.provd+json
{
    "dhcp_info": {
        "ip": "192.168.1.100",
        "mac": "00:11:22:33:44:55",
        "op": "commit",
        "options": [
            "06066.6f.6f.62.61.72.a"
        ]
    }
}
```

Example response

HTTP/1.1 204 No Content

Configs Management

Get the Config Manager

The config manager links to the following resources:

- The cfg. configs relation links to the *list of configs*.
- The cfg.autocreate relation links to the *config autocreate service*.

Query

GET /provd/cfg_mgr HTTP/1.1

Example request

```
GET /provd/cfg_mgr HTTP/1.1
Host: xivoserver
Accept: application/vnd.proformatique.provd+json
```

```
HTTP/1.1 200 OK
Content-Type: application/vnd.proformatique.provd+json
{
    "links": [
        {
          "href": "/provd/cfg_mgr/configs",
          "rel": "cfg.configs"
        },
        {
        }
    }
}
```

```
"href": "/provd/cfg_mgr/autocreate",
    "rel": "cfg.autocreate"
}
]
}
```

List Configs

Query

GET /provd/cfg_mgr/configs HTTP/1.1

Query Parameters

These are the same parameters as for the list devices action.

Example request

```
GET /provd/cfg_mgr/configs HTTP/1.1
Host: xivoserver
Accept: application/vnd.proformatique.provd+json
```

```
HTTP/1.1 200 OK
Content-Type: application/vnd.proformatique.provd+json
{
    "configs": [
        {
            "configdevice": "defaultconfigdevice",
            "deletable": true,
            "id": "38e5e08ffe804b468f5aa53b9536bb25",
            "parent_ids": [
                "base",
                "defaultconfigdevice"
            ],
            "raw_config": {
                "X_key": "",
                "exten_dnd": "*25",
                "exten_fwd_busy": "*23",
                "exten_fwd_disable_all": "*20",
                "exten_fwd_no_answer": "*22",
                "exten_fwd_unconditional": "*21",
                "exten_park": null,
                "exten_pickup_call": "*8",
                "exten_pickup_group": null,
                "exten_voicemail": "*98",
                "funckeys": {
                    "1": {
                        "label": "",
                        "line": 1,
                        "type": "speeddial",
                        "value": "1005"
```

```
}
                },
                "protocol": "SIP",
                "sip_dtmf_mode": "SIP-INFO",
                "sip_lines": {
                    "1": {
                        "auth_username": "je5qtq",
                        "display_name": "El\u00e8s 01",
                        "number": "1001",
                        "password": "T2S7C0",
                        "proxy_ip": "10.34.1.11",
                        "registrar_ip": "10.34.1.11",
                        "username": "je5qtq"
                    }
               }
          }
      }
   ]
}
```

Create a Config

Query

POST /provd/cfg_mgr/configs HTTP/1.1

```
POST /provd/cfg_mgr/configs HTTP/1.1
Host: xivoserver
Content-Type: application/vnd.proformatique.provd+json
{
    "config": {
        "parent_ids": [
            "base"
        ],
        "raw_config": {
            "sip": {
                "lines": {
                    "1": {
                        "auth_username": "100",
                        "display_name": "Foo",
                        "password": "100",
                        "username": "100"
                    }
               }
           }
       }
   }
}
```

Example response

```
HTTP/1.1 201 Created
Content-Type: application/vnd.proformatique.provd+json
Location: /provd/cfg_mgr/configs/77839d0f05c84662864b0ae5c27b33e4
{"id": "77839d0f05c84662864b0ae5c27b33e4"}
```

If the id field is not given, then an ID id automatically generated by the server.

Get a Config

Query

```
GET /provd/cfg_mgr/configs/<config_id> HTTP/1.1
```

Example request

```
GET /provd/cfg_mgr/configs/77839d0f05c84662864b0ae5c27b33e4 HTTP/1.1
Host: xivoserver
Accept: application/vnd.proformatique.provd+json
```

```
HTTP/1.1 200 OK
Content-Type: application/vnd.proformatique.provd+json
{
    "config": {
        "id": "77839d0f05c84662864b0ae5c27b33e4",
        "parent_ids": [
            "base"
        ],
        "raw_config": {
            "sip": {
                "lines": {
                    "1": {
                        "auth_username": "100",
                        "display_name": "Foo",
                        "password": "100",
                        "username": "100"
                    }
                }
           }
       }
   }
}
```

Get a Raw Config

Query

GET /provd/cfg_mgr/configs/<config_id>/raw HTTP/1.1

Example request

```
GET /provd/cfg_mgr/configs/77839d0f05c84662864b0ae5c27b33e4/raw HTTP/1.1
Host: xivoserver
Accept: application/vnd.proformatique.provd+json
```

Example response

```
HTTP/1.1 200 OK
Content-Type: application/vnd.proformatique.provd+json
{
    "raw_config": {
        "X_xivo_phonebook_ip": "10.34.1.11",
        "http_port": 8667,
        "ip": "10.34.1.11",
        "ntp_enabled": true,
        "ntp_ip": "10.34.1.11",
        "sip": {
            "lines": {
                "1": {
                    "auth_username": "100",
                    "display_name": "John",
                     "password": "100",
                     "username": "100"
                }
            }
        },
        "tftp_port": 69
    }
```

Update a Config

Query

PUT /provd/cfg_mgr/configs/<config_id> HTTP/1.1

```
PUT /provd/cfg_mgr/configs/77839d0f05c84662864b0ae5c27b33e4 HTTP/1.1
Host: xivoserver
Content-Type: application/vnd.proformatique.provd+json
{
    "config": {
```

```
"id": "77839d0f05c84662864b0ae5c27b33e4",
        "parent_ids": [
            "base"
        ],
        "raw_config": {
            "sip": {
                "lines": {
                    "1": {
                        "auth_username": "100",
                        "display_name": "John",
                        "password": "100",
                        "username": "100"
                    }
               }
           }
      }
   }
}
```

Example response

HTTP/1.1 204 No Content

Delete a Config

Query

```
DELETE /provd/cfg_mgr/configs/<config_id> HTTP/1.1
```

Example request

```
DELETE /provd/cfg_mgr/configs/77839d0f05c84662864b0ae5c27b33e4 HTTP/1.1
Host: xivoserver
```

Example response

HTTP/1.1 204 No Content

Autocreate a Config

This service is used to create a new config from the config that has the autocreate role.

Query

POST /provd/cfg_mgr/autocreate HTTP/1.1

Example request

```
POST /provd/cfg_mgr/autocreate HTTP/1.1
Host: xivoserver
Content-Type: application/vnd.proformatique.provd+json
{}
```

Example response

```
HTTP/1.1 201 Created
Content-Type: application/vnd.proformatique.provd+json
Location: /provd/cfg_mgr/configs/autoprov1411400365
{"id":"autoprov1411400365"}
```

Plugins Management

Get the Plugin Manager

The plugin manager links to the following resources:

- The srv.install relation links to the plugin manager *installation service*. This installation service permits installing/uninstalling plugins.
- The pg.plugins relation links to the *list of plugins*.
- The pg.reload relation links to the *plugin reload service*.

Query

GET /provd/pg_mgr HTTP/1.1

Example request

```
GET /provd/pg_mgr HTTP/1.1
Host: xivoserver
Accept: application/vnd.proformatique.provd+json
```

```
HTTP/1.1 200 OK
Content-Type: application/vnd.proformatique.provd+json
{
    "links": [
        {
          "href": "/provd/pg_mgr/install",
          "rel": "srv.install"
        },
        {
          "href": "/provd/pg_mgr/plugins",
        }
        }
    }
```

```
"rel": "pg.plugins"
},
{
    "href": "/provd/pg_mgr/reload",
    "rel": "pg.reload"
}
]
```

List Plugins

List the installed plugins.

If you want to install/uninstall plugins, you need to go trough the plugin installation service.

Query

GET /provd/pg_mgr/plugins HTTP/1.1

Example request

```
GET /provd/pg_mgr/plugins HTTP/1.1
Host: xivoserver
Accept: application/vnd.proformatique.provd+json
```

Example response

```
HTTP/1.1 200 OK
Content-Type: application/vnd.proformatique.provd+json
{
    "plugins": {
        "xivo-aastra-3.3.1-SP2": {
            "links": [
                 {
                     "href": "/provd/pg_mgr/plugins/xivo-aastra-3.3.1-SP2",
                     "rel": "pg.plugin"
                 }
            ]
        },
        "xivo-cisco-sccp-9.0.3": {
            "links": [
                 {
                     "href": "/provd/pg_mgr/plugins/xivo-cisco-sccp-9.0.3",
                     "rel": "pg.plugin"
                 }
            ]
        }
    }
}
```

Get a Plugin

The plugin links to the following resources:

- The pg.info relation links to the *plugin information*.
- The srv.install relation links to the plugin *installation service*. Plugins usually provided this service to install/uninstall firmware and language files.

Query

```
GET /provd/pg_mgr/plugins/<plugin_id> HTTP/1.1
```

Example request

```
GET /provd/pg_mgr/plugins/xivo-aastra-3.3.1-SP2 HTTP/1.1
Host: xivoserver
Accept: application/vnd.proformatique.provd+json
```

Example response

```
HTTP/1.1 200 OK
Content-Type: application/vnd.proformatique.provd+json
{
    "links": [
        {
            "href": "/provd/pg_mgr/plugins/xivo-aastra-3.3.1-SP2/info",
            "rel": "pg.info"
        },
        {
            "href": "/provd/pg_mgr/plugins/xivo-aastra-3.3.1-SP2/install",
            "rel": "srv.install"
        }
    ]
}
```

Get Information of a Plugin

Query

GET /provd/pg_mgr/plugins/<plugin_id>/info HTTP/1.1

Example request

```
GET /provd/pg_mgr/plugins/xivo-aastra-3.3.1-SP2/info HTTP/1.1
Host: xivoserver
Accept: application/vnd.proformatique.provd+json
```

```
HTTP/1.1 200 OK
Content-Type: application/vnd.proformatique.provd+json
```

{

```
"plugin_info": {
       "capabilities": {
            "Aastra, 6730i, 3.3.1.5089": {

       "description": "Plugin for Aastra 6730i, 6731i, 6735i, 6737i, 6739i, 6753i,
↔ 6755i, 6757i, 6757i CT, 9143i, 9480i, 9480i CT in version 3.3.1 SP2.",
       "version": "1.1"
   }
ļ
```

Reload a Plugin

Reload the given plugin. This is mostly useful during plugin development, after changing the code of the plugin, instead of restarting the xivo-provd application.

Query

POST /provd/pg_mgr/reload HTTP/1.1

```
POST /provd/pg_mgr/reload HTTP/1.1
Host: xivoserver
Content-Type: application/vnd.proformatique.provd+json
```

```
{
    "id": "xivo-aastra-3.3.1-SP2"
}
```

Example response

HTTP/1.1 204 No Content

General Resources

This section describes the resources that are available from more than one URI or are generic enough to not fit in a more specific section.

Operation In Progress

This resource represents an operation in progress and is used to follow the progress of an underlying operation. Said differently, it is a monitor on an operation that can change over time.

Get Current Status

Query

```
GET <uri> HTTP/1.1
```

Example request

```
GET <uri> HTTP/1.1
Host: xivoserver
Accept: application/vnd.proformatique.provd+json
```

Example response

```
HTTP/1.1 200 OK
Content-Type: application/vnd.proformatique.provd+json
{
    "status": "progress"
}
```

The status field describe the current status of the operation. The format is [label|]state[;current[/ end]](\(sub_oips\)) *. Here's some examples:

- progress
- downloadlprogress
- downloadlprogress;10
- downloadlprogress;10/100
- downloadlprogress(file_1lprogress;20/100)(file_2lwaiting;0/50)

- downloadlprogress;20/150(file_1lprogress)(file_2lwaiting)
- oplprogress(op11lprogress)(op12lwaiting))(op2lprogress)

The state of an operation is either waiting, progress, success or fail.

Delete

Delete the "operation in progress" resource.

This does not cancel the underlying operation; it only deletes the monitor. Every monitor that is created should be deleted, else they won't be freed by the process and they will accumulate, taking memory.

Query

DELETE <uri> HTTP/1.1

Example request

```
DELETE <uri> HTTP/1.1
Host: xivoserver
```

Example response

```
HTTP/1.1 204 No Content
```

Configuration Service

Get the Configuration

Query

GET <uri> HTTP/1.1

Example request

Example request for the configuration service of the provd manager.

```
GET /provd/configure HTTP/1.1

```

Get the Value of a Parameter

Query

GET <uri> HTTP/1.1

Example request

Example request for the NAT option of the configuration service of the provd entry point.

```
GET /provd/configure/NAT HTTP/1.1
Host: xivoserver
Accept: application/vnd.proformatique.provd+json
```

Example response

```
HTTP/1.1 200 OK
Content-Type: application/vnd.proformatique.provd+json
{
    "param": {
        "value": 0
    }
}
```

Set the Value of a Parameter

Query

PUT <uri> HTTP/1.1

Example request

Example request for the NAT option of the configuration service of the provd manager.

```
PUT /provd/configure/NAT HTTP/1.1
Host: xivoserver
Content-Type: application/vnd.proformatique.provd+json
{
    "param": {
        "value": 1
```

}

}

Example response

```
HTTP/1.1 204 No Content
Content-Type: application/vnd.proformatique.provd+json
```

Installation Service

Get the Installation Service

Query

GET **<uri> HTTP**/1.1

Example request

Example request for the installation service of the *plugin manager*.

```
GET /provd/pg_mgr/install HTTP/1.1
Host: xivoserver
Accept: application/vnd.proformatique.provd+json
```

Example response

```
HTTP/1.1 200 OK
Content-Type: application/vnd.proformatique.provd+json
{
    "links": [
        {
            "href": "/provd/pg_mgr/install/install",
            "rel": "srv.install.install"
        },
        {
            "href": "/provd/pg_mgr/install/uninstall",
            "rel": "srv.install.uninstall"
        },
        {
            "href": "/provd/pg_mgr/install/installed",
            "rel": "srv.install.installed"
        },
        {
            "href": "/provd/pg_mgr/install/installable",
            "rel": "srv.install.installable"
        },
        {
            "href": "/provd/pg_mgr/install/upgrade",
            "rel": "srv.install.upgrade"
        },
        {
            "href": "/provd/pg_mgr/install/update",
```

```
"rel": "srv.install.update"
}
]
```

The upgrade and update services are optional and not all installation service provide them.

Install a Package

Query

POST <uri> HTTP/1.1

Example request

Example request for the installation service of the plugin manager.

```
POST /provd/pg_mgr/install/install HTTP/1.1
Host: xivoserver
Content-Type: application/vnd.proformatique.provd+json
{
    "id": "xivo-polycom-4.0.4"
}
```

Example response

```
HTTP/1.1 201 Created
Location: /provd/pg_mgr/install/install/1
Content-Type: application/vnd.proformatique.provd+json
```

The URI returned in the Location header points to an operation in progress resource.

Uninstall a Package

Query

```
POST <uri> HTTP/1.1
```

Example request

Example request for the installation service of the plugin manager.

```
POST /provd/pg_mgr/install/uninstall HTTP/1.1
Host: xivoserver
Content-Type: application/vnd.proformatique.provd+json
{
    "id": "xivo-polycom-4.0.4"
}
```

Example response

```
HTTP/1.1 204 No Content
Content-Type: application/vnd.proformatique.provd+json
```

Upgrade a Package

Query

POST <uri> HTTP/1.1

Example request

Example request for the installation service of the plugin manager.

```
POST /provd/pg_mgr/install/upgrade HTTP/1.1
Host: xivoserver
Content-Type: application/vnd.proformatique.provd+json
{
    "id": "xivo-polycom-4.0.4"
}
```

Example response

```
HTTP/1.1 201 Created
Location: /provd/pg_mgr/install/upgrade/1
Content-Type: application/vnd.proformatique.provd+json
```

The URI returned in the Location header points to an operation in progress resource.

Update the List of Installable Packages

Query

POST <uri> HTTP/1.1

Example request

Example request for the installation service of the plugin manager.

```
POST /provd/pg_mgr/install/update HTTP/1.1
Host: xivoserver
Content-Type: application/vnd.proformatique.provd+json
{}
```

Example response

```
HTTP/1.1 201 Created
Location: /provd/pg_mgr/install/update/1
Content-Type: application/vnd.proformatique.provd+json
```

The URI returned in the Location header points to an operation in progress resource.

List Installable Packages

Query

```
GET <uri> HTTP/1.1
```

Example request

Example request for the installation service of the plugin manager.

```
GET /provd/pg_mgr/install/installable HTTP/1.1
Host: xivoserver
Accept: application/vnd.proformatique.provd+json
```

Example response

```
HTTP/1.1 200 OK
Content-Type: application/vnd.proformatique.provd+json

xivo-sysconfd REST API

This service provides a public API that can be used to change the configuration that are on a XiVO.

Warning: The 0.1 API is currently in development. Major changes could still happen and new resources will be added over time.

API reference

Asterisk Voicemail

Delete voicemail

Query

GET /delete_voicemail

Parameters

Mandatory

name the voicemail name

Optional

context the voicemail context (default is 'default')

Errors

| Error code | Error message | Description |
|------------|---------------|------------------------------|
| 404 | Not found | The voicemail does not exist |

Example requests

```
GET /delete_voicemail HTTP/1.1
Host: xivoserver
Accept: application/json
```

Example response

```
HTTP/1.1 200 OK
Content-Type: application/json
{
    nothing
}
```

Common configuration

Apply configuration

Query

```
GET /commonconf_apply
```

Generate configuration

Query

POST /commonconf_generate

Dhcpd configuration

Update configuration

Query

GET /dhcpd_update

Ethernet configuration

Discover interfaces

Query

GET /discover_netifaces

Example request

```
GET /discover_netifaces HTTP/1.1
Host: xivoserver
Accept: application/json
```

Example response

```
HTTP/1.1 200 OK
Content-Type: application/json
{

"options": null
}
```

Modify interface

Description

}

| Field | Values | Description |
|-----------|---------|--------------------------------|
| iface | string | Interface name like eth0 |
| method | list | static or dhcp |
| address | string | |
| netmask | string | |
| broadcast | string | |
| gateway | string | |
| mtu | int | |
| auto | boolean | |
| up | boolean | |
| options | list | dns-search and dns-nameservers |

Query

PUT /modify_physical_eth_ipv4

Example request

```
PUT /modify_physical_eth_ipv4 HTTP/1.1
Host: xivoserver
Content-Type: application/json
{
    "ifname': "eth0",
    "method': "dhcp",
    "auto": "True"
}
```

Replace virtual interface

Query

PUT /replace_virtual_eth_ipv4

Example request

```
PUT /replace_virtual_eth_ipv4 HTTP/1.1
Host: xivoserver
Content-Type: application/json
{
    "ifname": "eth0:0",
    "new_ifname": "eth0:1",
    "method": "dhcp",
    "auto": "True"
}
```

Modify interface

Query

PUT /modify_eth_ipv4

Example request

Change state

Query

PUT /change_state_eth_ipv4

Example request

```
PUT /change_state_eth_ipv4 HTTP/1.1
Host: xivoserver
Content-Type: application/json
{
    'ifname' : 'eth0',
    'state': True
}
```

Delete interface ipv4

Query

GET /delete_eth_ipv4/<interface>

Example request

```
GET /delete_eth_ipv4/eth0 HTTP/1.1
Host: xivoserver
Content-Type: application/json
```

HA configuration

Get HA configuration

Query

GET /get_ha_config

Update HA configuration

Query

```
POST /update_ha_config
```

network configuration

Get network configuration

Query

GET /network_config

Rename ethernet interface

Query

POST /rename_ethernet_interface

swap ethernet interface

Query

POST /swap_ethernet_interfaces

Routes

Query

POST /routes

OpenSSL configuration

List certificates

Query

GET /openssl_listcertificates

Get certificate infos

Query

GET /openssl_certificateinfos

Export public key

Query

GET /openssl_exportpubkey

Export SSL certificate

Query

GET /openssl_export

Create CA certificate

Query

POST /openssl_createcacertificate

Create certificate

Query

POST / openssl_createcertificate

Delete certificate

Query

GET /openssl_deletecertificate

Import SSL certificate

Query

POST /openssl_import

DNS configuration

Host configuration

Query

POST /hosts

Query

POST /resolv_conf

Services daemon

Reload services

Query

POST /services

Xivo Services

Reload XiVO services

Query

POST /xivoctl

Handlers

Execute handlers

Query

POST /exec_request_handlers

Status check

Status

Query

GET /status-check

Example request

```
GET /status-check HTTP/1.1
Host: xivoserver
Content-Type: application/json
```

Example response

```
HTTP/1.1 200 OK
Content-Type: application/json
{
    "status": "up"
}
```

For other services, see http://xivo/api/. This public instance does not allow you to directly test the requests (i.e. the "Try it out!" button will not work), but you may use the *embedded version of your XiVO*, where this button will work.

How to use the embedded REST API web interface (Swagger UI)

Every XiVO server embeds its own copy of the Swagger UI. The instance embedded in the XiVO allows you to directly try the requests with the in-page buttons.

For the rest of this article, we will consider that your XiVO is accessible under the hostname MY_XIVO.

The instance is available at: http://MY_XIVO/api

Before using the Swagger UI, there are a few prerequisites:

- Accept the HTTPS certificate for each service of the XiVO
- Add the permissions to use the REST API to a Web Services Access user
- Obtain an authentication token

HTTPS certificates

For each service on the left menu that you want to try, you need to accept the HTTPS certificate for this service. To that end:

- 1. click on the service in the menu on the left
- 2. copy the URL you see in the text box at the top of the page, something like: https://MY_XIVO:9497/ 0.1/api/api.json and paste it in your browser
- 3. accept the HTTPS certificate validation exception
- 4. go back to http://MY_XIVO/api and select the service again (or click on the top-right "Explore" button)

You should now be able to see the different sections for the REST API of that service.

REST API permissions

You must create a Web Services Access with the right permissions before using the REST API. See *Web Services Access*.

Each endpoint has its own ACL, but you may add wildcard ACLs, like:

- auth. # to gain access to all xivo-auth REST API endpoints
- confd. # to gain access to all xivo-confd REST API endpoints
- # to gain access to every endpoint of every service.

Warning: Only use wildcards when doing tests, not with a production REST API access. You should always restrict the permissions to the bare minimum.

Obtain an authentication token

You can get a token via Swagger UI (what else?). Choose the xivo-auth service in the list of REST API. Under tokens, choose POST /tokens.

- 1. In the top-right text box of the page (left to the "Explore" button), fill "token" with the string username:password where those credentials come from the Web Services Access you created earlier.
- 2. Go back to the POST /tokens section and click on the yellow box to the right of the body parameter. This will pre-fill the body parameter.
- 3. In the body parameter, set:
 - backend to xivo_service
 - expiration to the number of seconds for the token to be valid (e.g. 3600 for one hour). After the expiration time, you will need to re-authenticate to get a new token.
- 4. Click "Try it out" at the end of the section
- 5. In the response, you should see a token attribute.

For more informations about the backends of xivo-auth, see xivo-auth plugins.

Use the authentication token

To use the authentication token, choose the service for which you want to try the REST API, then paste the token in the top-right text box. You do not need to click "Explore" to apply the token change, the new token will be used automatically at the next request you send.

You can now choose a REST API endpoint and "Try it out".

10.4.2 Access

Each REST API is available via HTTPS on different ports.

10.4.3 Examples (xivo-confd)

```
# Get the list of users
curl --insecure \
-H 'Accept: application/json' \
-H 'X-Auth-Token: 17496bfa-4653-9d9d-92aa-17def0fa9826' \
https://xivo:9486/1.1/users
# Create a user
# When sending data, you need the Content-Type header.
curl --insecure \
-X POST \
-d '{"firstname": "hello-world"} \
-H 'Accept: application/json' \
-H 'Content-Type: application/json' \
-H 'X-Auth-Token: 17496bfa-4653-9d9d-92aa-17def0fa9826' \
https://xivo:9486/1.1/users
```

10.4.4 Authentication

For all REST APIs, the main way to authenticate is to use an access token obtained from *xivo-auth*. This token should be given in the X-Auth-Token header in your request. For example:

```
curl <options...> -H 'X-Auth-Token: 17496bfa-4653-9d9d-92aa-17def0fa9826' https://
```

Also, your token needs to have the right ACLs to give you access to the resource you want. See *REST API Permissions*.

REST API Permissions

The tokens delivered by *xivo-auth* have a list of permissions associated (ACL), that determine which REST resources are authorized for this token. Each REST resource has an associated required ACL. When you try to access to a REST resource, this resource requests xivo-auth with your token and the required ACL to validate the access.

Syntax

An ACL contains 3 parts separated by dot (.)

- *service*: name of service, without prefix xivo- (e.g. xivo-confd -> confd).
- resource: name of resource separated by dot (.) (e.g. /users/17/lines -> users.17.lines).

- action: action performed on resource. Generally, this is the following schema:
 - get -> read
 - put -> update
 - post -> create
 - delete -> delete

Substitutions

There are 3 substitution values for an ACL.

- *: replace only one word between dot.
- #: replace one or multiple words.
- me: replace the user_uuid from sent token.

Example

The ACL confd.users.me.#.read will have access to the following REST resources:

```
GET /users/{user_id}/cti
GET /users/{user_id}/funckeys
GET /users/{user_id}/funckeys/{position}
GET /users/{user_id}/funckeys/templates
GET /users/{user_id}/lines
GET /users/{user_id}/lines/{line_id}
GET /users/{user_id}/voicemail
```

- service: confd
- resource: users.me.#
- *action*: read

The ACL confd.users.me.funckeys.*.* will have access to the following REST resources:

```
DELETE /users/{user_id}funckeys/{position}
GET /users/{user_id}funckeys/{position}
PUT /users/{user_id}funckeys/{position}
GET /users/{user_id}funckeys/templates
```

- service: confd
- *resource*: users.me.funckeys.*
- action: *

Where {user_id} is the user uuid from the token.

Available ACLs

The ACL corresponding to each resource is documented. Some resources may not have any associated ACL yet, so you must use {service}.# instead.

See also Service Authentication for details about the token-based authentication process.

Other methods (xivo-confd)

Warning: DEPRECATED

For compatibility reason, xivo-confd may accept requests without an access token. For this, you must create a webservices user in the web interface (*Configuration* \rightarrow *Management* \rightarrow *Web Services Access*):

- if an IP address is specified for the user, no authentication is needed
- if you choose not to specify an IP address for the user, you can connect to the REST API with a HTTP Digest authentication, using the user name and password you provided. For instance, the following command line allows to retrieve XiVO users through the REST API, using the login **admin** and the password **passadmin**:

10.4.5 HTTP status codes

Standard HTTP status codes are used. For the full definition see IANA definition.

- 200: Success
- 201: Created
- 400: Incorrect syntax
- 404: Resource not found
- 406: Not acceptable
- 412: Precondition failed
- 415: Unsupported media type
- 500: Internal server error

See also *Errors* for general explanations about error codes.

10.4.6 General URL parameters

Example usage of general parameters:

```
GET http://<xivo_address>:9486/1.1/voicemails?limit=X&offset=Y
```

Parameters

order Sort the list using a column (e.g. "number"). See specific resource documentation for columns allowed.

direction 'asc' or 'desc'. Sort list in ascending (asc) or descending (desc) order

limit total number of resources to show in the list. Must be a positive integer

offset number of resources to skip over before starting the list. Must be a positive integer

search search resources. Only resources with a field containing the search term will be listed.

10.4.7 Data representation

Data retrieved from the REST server

JSON is used to encode returned or sent data. Therefore, the following headers are needed:

- when the request is supposed to return JSON: Accept = application/json
- when the request's body contains JSON: Content-Type = application/json

Note: Optional properties can be added without changing the protocol version in the main list or in the object list itself. Properties will not be removed, type and name will not be modified.

Getting object lists

GET /1.1/objects

When returning lists the format is as follows:

- total number of items in total in the system configuration (optional)
- items returned data as an array of object properties list.

Other optional properties can be added later.

Response data format

```
{
    "total": 2,
    "items":
    [
        {
            "id": "1",
            "prop1": "test"
        },
        {
            "id": "2",
            "prop1": "ssd"
        }
    ]
}
```

Getting An Object

Format returned is a list of properties. The object should always have the same attributes set, the default value being the equivalent to NULL in the content-type format.

```
GET /1.1/objects/<id>
```

```
Response data format
```

```
{
    "id": "1",
    "prop1": "test"
}
```

Data sent to the REST server

The XiVO REST server implements POST and PUT methods for item creation and update respectively. Data is created using the POST method via a root URL and is updated using the PUT method via a root URL suffixed by /<id. The server expects to receive JSON encoded data. Only one item can be processed per request. The data format and required data fields are illustrated in the following example:

```
Request data format
```

```
{
    "id": "1",
    "prop1": "test"
}
```

When updating, only the id and updated properties are needed, omitted properties are not updated. Some properties can also be optional when creating an object.

Errors

A request to the web services may return an error. An error will always be associated to an HTTP error code, and eventually to one or more error messages. The following errors are common to all web services:

| Error | Error mes- | Description |
|-------|----------------|---|
| code | sage | |
| 406 | empty | Accept header missing or contains an unsupported content type |
| 415 | empty | Content-Type header missing or contains an unsupported content type |
| 500 | list of errors | An error occured on the server side; the content of the message depends of the type |
| | | of errors which occured |

The 400, 404 and 412 errors depend on the web service you are requesting. They are separately described for each of them.

The error messages are contained in a JSON list, even if there is only one error message:

```
[ message_1, message_2, ... ]
```

10.5 Subroutine

10.5.1 What is it ?

The preprocess subroutine allows you to enhance XiVO features through the Asterisk dialplan. Features that can be enhanced are :

- User
- Group
- Queue
- Meetme
- Incoming call
- · Outgoing call

There are three possible categories :

- Subroutine for one feature
- Subroutine for global forwarding

• Subroutine for global incoming call to an object

Subroutines are called at the latest possible moment in the dialplan, so that the maximum of variables have already been set: this way, the variables can be read and modified at will before they are used.

Here is an example of the dialplan execution flow when an external incoming call to a user being forwarded to another external number (like a forward to a mobile phone):

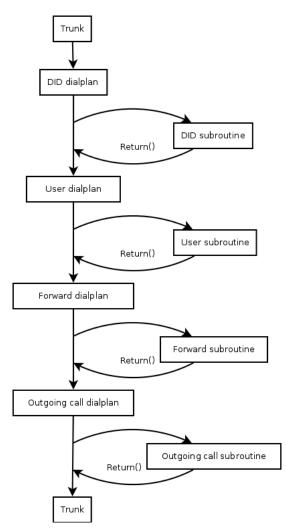

Fig. 10.5: Where subroutines are called in dialplan

10.5.2 Adding new subroutine

If you want to add a new subroutine, we propose to edit a new configuration file in the directory /etc/ asterisk/extensions_extra.d. You can also add this file by the web interface.

An example:

```
[myexample]
exten = s,1,NoOp(This is an example)
same = n,Return()
```

Subroutines should always end with a Return (). You may replace Return () by a Goto() if you want to completely bypass the XiVO dialplan, but this is not recommended.

To plug your subroutine into the XiVO dialplan, you must add myexample in the subroutine field in the web interface, e.g. $Services \rightarrow IPBX \rightarrow PBX$ Settings $\rightarrow Users \rightarrow Edit \rightarrow tab$ General \rightarrow Preprocess subroutine.

10.5.3 Global subroutine

There is predefined subroutine for this feature, you can find the name and the activation in the /etc/xivo/ asterisk/xivo_globals.conf. The variables are:

```
; Global Preprocess subroutine
XIVO_PRESUBR_GLOBAL_ENABLE = 1
XIVO_PRESUBR_GLOBAL_USER = xivo-subrgbl-user
XIVO_PRESUBR_GLOBAL_AGENT = xivo-subrgbl-agent
XIVO_PRESUBR_GLOBAL_GROUP = xivo-subrgbl-group
XIVO_PRESUBR_GLOBAL_QUEUE = xivo-subrgbl-queue
XIVO_PRESUBR_GLOBAL_MEETME = xivo-subrgbl-meetme
XIVO_PRESUBR_GLOBAL_DID = xivo-subrgbl-did
XIVO_PRESUBR_GLOBAL_OUTCALL = xivo-subrgbl-outcall
XIVO_PRESUBR_GLOBAL_PAGING = xivo-subrgbl-paging
```

So if you want to add a subroutine for all of your XiVO users you can do this:

```
[xivo-subrgbl-user]
exten = s,1,NoOp(This is an example for all my users)
same = n,Return()
```

10.5.4 Forward subroutine

You can also use a global subroutine for call forward.

```
; Preprocess subroutine for forwards

XIVO_PRESUBR_FWD_ENABLE = 1

XIVO_PRESUBR_FWD_USER = xivo-subrfwd-user

XIVO_PRESUBR_FWD_GROUP = xivo-subrfwd-group

XIVO_PRESUBR_FWD_QUEUE = xivo-subrfwd-queue

XIVO_PRESUBR_FWD_MEETME = xivo-subrfwd-meetme

XIVO_PRESUBR_FWD_VOICEMAIL = xivo-subrfwd-voicemail

XIVO_PRESUBR_FWD_SCHEDULE = xivo-subrfwd-schedule

XIVO_PRESUBR_FWD_VOICEMENU = xivo-subrfwd-voicemenu

XIVO_PRESUBR_FWD_SOUND = xivo-subrfwd-sound

XIVO_PRESUBR_FWD_CUSTOM = xivo-subrfwd-custom

XIVO_PRESUBR_FWD_EXTENSION = xivo-subrfwd-extension
```

10.5.5 Dialplan variables

Some of the XiVO variables can be used and modified in subroutines (non exhaustive list):

- XIVO_CALLOPTIONS: the value is a list of options to be passed to the Dial application, e.g. hHtT. This variable is available in agent, user and outgoing call subroutines. Please note that it may not be set earlier, because it will be overwritten.
- XIVO_CALLORIGIN: the value is:
 - extern for calls coming from a DID
 - intern for all other calls

This variable is used by xivo-agid when *selecting the ringtone* for ringing a user. This variable is available only in user subroutines.

- XIVO_DSTNUM: the value is the extension dialed, as received by XiVO (e.g. an internal extension, a DID, or an outgoing extension including the local prefix). This variable is available in all subroutines.
- XIVO_GROUPNAME: the value is the name of the group being called. This variable is only available in group subroutines.

- XIVO_GROUPOPTIONS: the value is a list of options to be passed to the Queue application, e.g. hHtT. This variable is only available in group subroutines.
- XIVO_INTERFACE: the value is the *Technology/Resource* pairs that are used as the first argument of the Dial application. This variable is only available in the user subroutines.
- XIVO_MOBILEPHONENUMBER: the value is the phone number of a user, as set in the web interface. This variable is only available in user subroutines.
- XIVO_QUEUENAME: the value is the name of the queue being called. This variable is only available in queue subroutines.
- XIVO_QUEUEOPTIONS: the value is a list of options to be passed to the Queue application, e.g. hHtT. This variable is only available in queue subroutines.
- XIVO_SRCNUM: the value is the callerid number of the originator of the call: the internal extension of a user (outgoing callerid is ignored), or the public extension of an external incoming call. This variable is available in all subroutines.

10.6 Queue logs

Queue logs are events logged by Asterisk in the queue_log table of the asterisk database. Queue logs are used to generate XiVO call center statistics.

10.6.1 Queue log sample

Agent callback login

CHAPTER 11

Contributing

General information:

11.1 Contributing to the Documentation

XiVO documentation is generated with Sphinx. The source code is available on GitLab at https://gitlab.com/xivo.solutions/xivo-solutions-doc

Provided you already have Python installed on your system. You need first to install Sphinx : <code>easy_install-U Sphinx^1</code>.

Quick Reference

- http://docutils.sourceforge.net/docs/user/rst/cheatsheet.txt
- http://docutils.sourceforge.net/docs/user/rst/quickref.html
- http://openalea.gforge.inria.fr/doc/openalea/doc/_build/html/source/sphinx/rest_syntax.html

11.1.1 Documentation guideline

Here's the guideline/conventions to follow for the XiVO documentation.

Language

The documentation must be written in english, and only in english.

Sections

The top section of each file must be capitalized using the following rule: capitalization of all words, except for articles, prepositions, conjunctions, and forms of to be.

Correct:

¹ easy_install can be found in the debian package python-setuptools: sudo apt-get install python-setuptools

The Vitamins are **in** My Fresh California Raisins

Incorrect:

The Vitamins Are In My Fresh California Raisins

Use the following punctuation characters:

- * with overline, for "file title"
- =, for sections
- –, for subsections
- ^, for subsubsections

Punctuation characters should be exactly as long as the section text.

Correct:

Section1

Incorrect:

Section2 _____

There should be 2 empty lines between sections, except when an empty section is followed by another section.

Correct:

```
Section1
=======
Foo.
Section2
======
Bar.
```

Correct:

| Correct: | |
|----------|--|
| Bar. | |
| ====== | |
| Section2 | |
| target: | |
| | |
| Foo. | |
| ====== | |
| Section1 | |

| Section1 |
|-------------|
| |
| Subsection1 |
| |

Foo.

Incorrect:

```
Section1
=======
Foo.
Section2
=======
Bar.
```

Lists

Bullet lists:

* First item* Second item

Autonumbered lists:

#. First item
#. Second item

Literal blocks

Use :: on the same line as the line containing text when possible.

The literal blocks must be indented with three spaces.

Correct:

```
Bla bla bla::
apt-get update
```

Incorrect:

```
Bla bla bla:
.::
    apt-get update
```

Inline markup

Use the following roles when applicable:

• :file: for file, i.e.:

The :file:`/dev/null` file.

• :menuselection: for the web interface menu:

The :menuselection:`Configuration --> Management --> Certificates` page.

• : guilabel: for designating a specific GUI element:

```
The :guilabel: `Action` column.
```

Others

- There must be no warning nor error messages when building the documentation with make html.
- There should be one and only one newline character at the end of each file
- There should be no trailing whitespace at the end of lines
- Paragraphs must be wrapped and lines should be at most 100 characters long

11.2 Debugging Asterisk

11.2.1 Precondition

To debug asterisk crashes or freezes, you need the following debug packages on your XiVO:

| General rule | XiVO < 14.18 | XiVO >= 14.18 14.18 | | |
|-----------------|---|---|--|--|
| Example version | 14.12 | | | |
| Commands | | | | |
| | apt-get install xivo-fai- →14.12 apt-get update apt-get install gdb apt-get install -t xivo- →14.12 asterisk-dbg_ →xivo-libsccp-dbg | <pre>xivo-dist xivo-14.18 apt-get update apt-get install gdb apt-get install -t xivo- \$\implies14.18 asterisk-dbg_ \$\impliesxivo-libsccp-dbg \$\impliesxivo-libsccp-dbg \$\ \$\\$ \$\\$ \$\\$ \$\\$ \$\\$</pre> | | |

11.2.2 So There is a Problem with Asterisk. Now What ?

- 1. Find out the time of the incident from the people most likely to know
- 2. Determine if there was a segfault
 - (a) The command grep segfault /var/log/syslog should return a line such as the following:

```
Oct 16 16:12:43 xivo-1 kernel: [10295061.047120] asterisk[1255]: segfault_

→at e ip b751aa6b sp b5ef14d4 error 4 in libc-2.11.3.so[b74ad000+140000]
```

- (b) Note the exact time of the incident from the segfault line.
- (c) Follow the *Debugging Asterisk Crash* procedure.
- 3. If you observe some of the following common symptoms, follow the *Debugging Asterisk Freeze* procedure.
 - The output of command service asterisk status says Asterisk PBX is running.
 - No more calls are distributed and phones go to No Service.
 - Command core show channels returns only headers (no data) right before returning
- 4. Fetch Asterisk logs for the day of the crash (make sure file was not already logrotated):

```
cp -a /var/log/asterisk/full /var/local/`date +"%Y%m%d"`-`hostname`-asterisk-

→full.log
```

5. Fetch xivo-ctid logs for the day of the crash (make sure file was not already logrotated):

```
cp -a /var/log/xivo-ctid.log /var/local/`date +"%Y%m%d"`-`hostname`-xivo-ctid.

→log
```

11.2.3 Debugging Asterisk Crash

When asterisk crashes, it usually leaves a core file in /var/spool/asterisk/.

You can create a backtrace from a core file named core_file with:

```
gdb -batch -ex "bt full" -ex "thread apply all bt" asterisk core_file > bt-threads. {\hookrightarrow} txt
```

11.2.4 Debugging Asterisk Freeze

You can create a backtrace of a running asterisk process with:

gdb -batch -ex "thread apply all bt" asterisk \$(pidof asterisk) > bt-threads.txt

If your version of asterisk has been compiled with the DEBUG_THREADS flag, you can get more information about locks with:

asterisk -rx "core show locks" > core-show-locks.txt

Note: Debugging freeze without this information is usually a lot more difficult.

Optionally, other information that can be interesting:

- the output of asterisk -rx 'core show channels'
- the verbose log of asterisk just before the freeze

11.2.5 Recompiling Asterisk

It's relatively straightforward to recompile the asterisk version of your XiVO with the DEBUG_THREADS and DONT_OPTIMIZE flag, which make debugging an asterisk problem easier.

The steps are:

1. Uncomment the deb-src line for the XiVO sources:

```
sed -i 's/^# *deb-src/deb-src/' /etc/apt/sources.list.d/xivo*
```

2. Fetch the asterisk source package:

```
mkdir -p ~/ast-rebuild
cd ~/ast-rebuild
apt-get update
apt-get install -y build-essential
apt-get source asterisk
```

3. Install the build dependencies:

apt-get build-dep -y asterisk

4. Enable the DEBUG_THREADS and DONT_OPTIMIZE flag:

```
cd <asterisk-source-folder>
vim debian/rules
```

5. Update the changelog by appending +debug1 in the package version:

vim debian/changelog

6. Rebuild the asterisk binary packages:

dpkg-buildpackage -us -uc

This will create a couple of .deb files in the parent directory, which you can install via dpkg.

Recompiling a vanilla version of Asterisk

It is sometimes useful to produce a "vanilla" version of Asterisk, i.e. a version of Asterisk that has none of the XiVO patches applied, to make sure that the problem is present in the original upstream code. This is also sometimes necessary before opening a ticket on the Asterisk issue tracker.

The procedure is similar to the one described above. Before calling dpkg-buildpackage, you just need to:

1. Make sure quilt is installed:

apt-get install -y quilt

2. Unapply all the currently applied patches:

quilt pop -a

3. Remove all the lines in the debian/patches/series file:

truncate -s0 debian/patches/series

When installing a vanilla version of Asterisk on a XiVO 16.08 or earlier, you'll need to stop monit, otherwise it will restart asterisk every few minutes.

11.2.6 Running Asterisk under Valgrind

1. Install valgrind:

apt-get install valgrind

- 2. Recompile asterisk with the DONT_OPTIMIZE flag.
- 3. Edit /etc/asterisk/modules.conf so that asterisk doesn't load unnecessary modules. This step is optional. It makes asterisk start (noticeably) faster and often makes the output of valgrind easier to analyze, since there's less noise.
- 4. Edit /etc/asterisk/asterisk.conf and comment the highpriority option. This step is optional.
- 5. Stop monit and asterisk:

```
monit quit
service asterisk stop
```

- 6. Stop all unneeded XiVO services. For example, it can be useful to stop xivo-ctid, so that it won't interact with asterisk via the AMI.
- 7. Copy the valgrind.supp file into /tmp. The valgrind.supp file is located in the contrib directory of the asterisk source code.

8. Execute valgrind in the /tmp directory:

```
cd /tmp
valgrind --leak-check=full --log-file=valgrind.txt --suppressions=valgrind.
→supp --vgdb=no asterisk -G asterisk -U asterisk -fnc
```

Note that when you terminate asterisk with Control-C, asterisk does not unload the modules before exiting. What this means is that you might have lots of "possibly lost" memory errors due to that. If you already know which modules is responsible for the memory leak/bug, you should explicitly unload it before terminating asterisk.

Running asterisk under valgrind takes a lots of extra memory, so make sure you have enough RAM.

11.3 Debugging Daemons

To activate debug mode, add debug: true in the daemon *configuration file*). The output will be available in the daemon's *log file*.

It is also possible to run the XiVO daemon, in command line. This will allow to run in foreground and debug mode. To see how to use it, type:

xivo-{name} -h

Note that it's usually a good idea to stop monit before running a daemon in foreground:

```
systemctl stop monit.service
```

11.3.1 xivo-confgend

```
twistd -no -u xivo-confgend -g xivo-confgend --python=/usr/bin/xivo-confgend --

-logger xivo_confgen.bin.daemon.twistd_logs
```

No debug mode in confgend.

11.3.2 xivo-provd

```
twistd -no -u xivo-provd -g xivo-provd -r epoll --logger provd.main.twistd_logs_
→xivo-provd -s -v
```

- · -s for logging to stderr
- -v for verbose

11.3.3 consul

There is no log file, but you can consult the output of consul with:

```
consul monitor
```

2015/08/03 09:48:25 [INFO] consul: cluster leadership acquired 2015/08/03 09:48:25 [INFO] consul: New leader elected: this-xivo 2015/08/03 09:48:26 [INFO] raft: Disabling EnableSingleNode (bootstrap) 2015/08/03 11:04:08 [INFO] agent.rpc: Accepted client: 127.0.0.1:41545

11.4 Generate your own prompts

If you want your XiVO to speak in your language that is not supported by XiVO, and you don't want to record the whole package of sounds in a studio, you may generate them yourself with some text-to-speech services.

The following procedure will generate prompts for pt_BR (portuguese from Brazil) based on the Google TTS service.

Note: There are two sets of prompts: the Asterisk prompts and the XiVO prompts. This procedure only covers the XiVO prompts, but it may be adapted for Asterisk prompts.

- 1. Create an account on Transifex and join the team of translation of XiVO.
- 2. Translate the prompts in the xivo-prompts resource.
- 3. Go to https://www.transifex.com/proformatique/xivo/xivo-prompt/pt_BR/download/for_use/ and download the file on your XiVO. You should have a file named like for_use_xivo_xivo-prompt_pt_BR. ini.
- 4. On your XiVO, download the tool to automate the use of Google TTS:

```
wget https://github.com/zaf/asterisk-googletts/raw/master/cli/googletts-cli.pl
chmod +x googletts-cli.pl
```

5. Then run the tool, and generate the sound files (set LANGUAGE and COUNTRY to your own language):

```
LANGUAGE=pt

COUNTRY=BR

mkdir -p wav/{digits,letters}

cat for_use_xivo_xivo-prompt_${LANGUAGE}_${COUNTRY}.ini | while IFS='=' read_

→file text ; do

echo $file

./googletts-cli.pl -t "$text" -1 ${LANGUAGE}-${COUNTRY} -s 1.4 -r 8000 -o_

→wav/$file.wav

done
```

6. Install the prompts on your system:

mv wav /usr/share/asterisk/sounds/\${LANGUAGE}_\${COUNTRY}

7. Make your language available in the web interface:

Note that this last modification may be erased after running xivo-upgrade.

And that's it, you can configure a user to use your new language and he will hear the prompts in your language. You may also want to use the *xivo-confd HTTP API* to mass-update your users.

11.5 XiVO Guidelines

11.5.1 Inter-process communication

Our current goal is to use only two means of communication between XiVO processes:

- a REST API over HTTP for synchronous commands
- a software bus (RabbitMQ) for asynchronous events

Each component should have its own REST API and its own events and can communicate with every other component from across a network only via those means.

11.5.2 Service API

The current xivo-dao Git repository contains the basis of the future services Python API. The API is split between different resources available in XiVO, such as users, groups, schedules... For each resource, there are different modules :

- service: the public module, providing possible actions. It contains only business logic and no technical logic. There must be no file name, no SQL queries and no URLs in this module.
- dao: the private Data Access Object. It knows where to get data and how to update it, such as SQL queries, file names, URLs, but has no business logic.
- model: the public class used to represent the resource. It must be self-contained and have almost no methods, except for computed fields based on other fields in the same object.
- notifier: private, it knows to whom and in which format events must be sent.
- validator: private, it checks input parameters from the service module.

11.5.3 Definition of XiVO Daemon

The goal is to make XiVO as elastic as possible, i.e. the XiVO services need to be able to run on separate machines and still talk to each other.

To be in accordance with our goal, a XiVO daemon must (if applicable):

- Offer a REST API (with encryption, authentication and accepting cross-site requests)
- Be able to read and send events on a software bus
- Be able to run inside a container, such as Docker, and be separated from the XiVO server
- Offer a configuration file in YAML format.
- Access the XiVO database through the xivo-dao library
- Have a configurable level of logging
- Have its own log file
- Be extendable through the use of plugins
- Not run with system privileges
- Be installable from source
- Service discovery with consul

Currently, none of the XiVO daemons meet these expectations; it is a work in progress.

11.6 Network

11.6.1 Configuration for daemon

Network Flow table (IN) :

| Daemon Name | Service | Protocol | Port | Listen | Authentication | Enabled |
|------------------|-----------------|----------|------|-----------|----------------|---------|
| - | ICMP | ICMP | - | 0.0.0.0 | no | yes |
| postfix | SMTP | ТСР | 25 | 0.0.0.0 | yes | yes |
| isc-dhcpd | DHCP | UDP | 67 | 0.0.0.0 | no | no |
| isc-dhcpd | DHCP | UDP | 68 | 0.0.0.0 | no | no |
| xivo-provd | TFTP | UDP | 69 | 0.0.0.0 | no | yes |
| ntpd | NTP | UDP | 123 | 0.0.0.0 | yes | yes |
| monit | HTTP | ТСР | 2812 | 127.0.0.1 | no | yes |
| asterisk | SIP | UDP | 5060 | 0.0.0.0 | yes | yes |
| asterisk | IAX | UDP | 4569 | 0.0.0.0 | yes | yes |
| asterisk | SCCP | ТСР | 2000 | 0.0.0.0 | yes | yes |
| asterisk | AMI | ТСР | 5038 | 127.0.0.1 | yes | yes |
| asterisk | HTTP | ТСР | 5039 | 127.0.0.1 | yes | yes |
| asterisk | HTTPS | ТСР | 5040 | 127.0.0.1 | yes | yes |
| sshd | SSH | ТСР | 22 | 0.0.0.0 | yes | yes |
| nginx | HTTP | ТСР | 80 | 0.0.0.0 | yes | yes |
| nginx | HTTPS | ТСР | 443 | 0.0.0.0 | yes | yes |
| munin | HTTP | ТСР | 4949 | 127.0.0.1 | no | yes |
| xivo-ctid | XiVO-CTI/S | ТСР | 5003 | 0.0.0.0 | yes | yes |
| postgresql | SQL | ТСР | 5432 | 127.0.0.1 | yes | yes |
| rabbitMQ | AMQP | ТСР | 5672 | 0.0.0.0 | yes | yes |
| consul | Consul RPC | ТСР | 8300 | 127.0.0.1 | yes | yes |
| consul | Consul Serf LAN | TCP/UDP | 8301 | 127.0.0.1 | yes | yes |
| consul | Consul Serf WAN | TCP/UDP | 8302 | 127.0.0.1 | yes | yes |
| consul | Consul HTTPS | ТСР | 8500 | 127.0.0.1 | both | yes |
| xivo-provd | HTTP | ТСР | 8666 | 127.0.0.1 | no | yes |
| xivo-provd | HTTP | ТСР | 8667 | 0.0.0.0 | no | yes |
| xivo-confgend | HTTP | ТСР | 8669 | 127.0.0.1 | no | yes |
| xivo-sysconfd | HTTP | ТСР | 8668 | 127.0.0.1 | no | yes |
| xivo-confd | HTTPS | ТСР | 9486 | 0.0.0.0 | yes | yes |
| xivo-confd | HTTP | ТСР | 9487 | 127.0.0.1 | no | yes |
| xivo-dird | HTTPS | ТСР | 9489 | 0.0.0.0 | yes | yes |
| xivo-amid | HTTPS | ТСР | 9491 | 0.0.0.0 | yes | yes |
| xivo-agentd | HTTPS | ТСР | 9493 | 0.0.0.0 | yes | yes |
| xivo-ctid | HTTP | ТСР | 9495 | 127.0.0.1 | no | yes |
| xivo-auth | HTTPS | ТСР | 9497 | 0.0.0.0 | both | yes |
| xivo-dird-phoned | HTTP | ТСР | 9498 | 0.0.0.0 | IP filtering | yes |
| xivo-dird-phoned | HTTPS | ТСР | 9499 | 0.0.0.0 | IP filtering | yes |

11.7 Debian packaging for XiVO

11.7.1 Adding a package from backports

1. Download the package:

apt-get download name-of-package/jessie-backports

2. Copy the .deb on to the mirror:

```
scp name-of-package.deb mirror.xivo.solutions:/tmp
```

3. Add package to distribution on mirror:

```
ssh mirror.xivo.solutions
cd /data/reprepro/xivo
reprepro includedeb xivo-dev /tmp/name-of-package.deb
```

11.8 Profiling Python Programs

11.8.1 Profiling CPU/Time Usage

Here's an example on how to profile xivo-ctid for CPU/time usage:

1. Stop the monit daemon:

```
service monit stop
```

2. Stop the process you want to profile, i.e. xivo-ctid:

service xivo-ctid stop

3. Start the service in foreground mode running with the profiler:

```
python -m cProfile -o test.profile /usr/bin/xivo-ctid -f
```

This will create a file named test.profile when the process terminates.

To profile xivo-confgend, you must use this command instead of the one above:

```
twistd -p test.profile --profiler=cprofile --savestats -no --python=/usr/bin/
```

Note that profiling multi-threaded program (xivo-agid, xivo-confd) doesn't work reliably.

The *Debugging Daemons* section documents how to launch the various XiVO services in foreground/debug mode.

4. Examine the result of the profiling:

```
$ python -m pstats test.profile
Welcome to the profile statistics browser.
% sort time
% stats 15
...
% sort cumulative
% stats 15
```

11.8.2 Measuring Code Coverage

Here's an example on how to measure the code coverage of xivo-ctid.

This can be useful when you suspect a piece of code to be unused and you want to have additional information about it.

1. Install the following packages:

```
apt-get install python-pip build-essential python-dev
```

2. Install coverage via pip:

pip install coverage

3. Run the program in foreground mode with coverage run:

```
service monit stop
service xivo-ctid stop
coverage erase
coverage run /usr/bin/xivo-ctid -f
```

The *Debugging Daemons* section documents how to launch the various XiVO service in foreground/debug mode.

4. After the process terminates, use coverage html to generate an HTML coverage report:

```
coverage html --include='*xivo_cti*'
```

This will generate an htlmcov directory in the current directory.

5. Browse the coverage report.

Either copy the directory onto your computer and open it with a web browser, or start a web server on the XiVO:

```
cd htmlcov
python -m SimpleHTTPServer
```

Then open the page from your computer (i.e. not on the xivo):

```
firefox http://<xivo-hostname>:8000
```

11.8.3 External Links

- Official python documentation
- PyMOTW
- coverage.py

11.9 Style Guide

11.9.1 Syntax

License

Python files start with a UTF8 encoding comment and the GPLv3 license. A blank line should separate the license from the imports

Example:

```
# -*- coding: utf-8 -*-
# Copyright 2016 Avencall
# SPDX-License-Identifier: GPL-3.0+
import argparse
```

Spacing

- Lines should not go further than 80 to 100 characters.
- In python, indentation blocks use 4 spaces
- In PHP, indentation blocks use tabs
- · Imports should be ordered alphabetically
- Separate module imports and from imports with a blank line

Example:

```
import argparse
import datetime
import os
import re
import shutil
import tempfile
from StringIO import StringIO
from urllib import urlencode
```

PEP8

When possible, use pep8 to validate your code. Generally, the following errors are ignored :

• E501 (max 80 chars per line)

Example:

```
pep8 --ignore=E501 xivo_cti
```

When possible, avoid using backslashes to separate lines.

Bad Example:

```
user = session.query(User).filter(User.firstname == firstname)\
    .filter(User.lastname == lastname)\
    .filter(User.number == number)\
    .all()
```

Good Example:

Strings

Avoid using the + operator for concatenating strings. Use string interpolation instead.

Bad Example:

phone_interface = "SIP" + "/" + username + "-" + password

Good Example:

phone_interface = "SIP/%s-%s" % (username, password)

Comments

Redundant comments should be avoided. Instead, effort should be put on making the code clearer.

Bad Example:

```
#Add the meeting to the calendar only if it was created on a week day
#(monday to friday)
if meeting.day > 0 and meeting.day < 7:
    calendar.add(meeting)</pre>
```

Good Example:

```
def created_on_week_day(meeting):
    return meeting.day > 0 and meeting.day < 7
if created_on_week_day(meeting):
    calendar.add(meeting)</pre>
```

Conditions

Avoid using parenthesis around if statements, unless the statement expands on multiple lines or you need to nest your conditions.

Bad Examples:

```
if(x == 3):
    print "condition is true"
if(x == 3 and y == 4):
    print "condition is true"
```

Good Examples:

```
if x == 3:
    print "condition is true"
if x == 3 and y == 4:
    print "condition is true"
if (extremely_long_variable == 3
    and another_long_variable == 4
    and yet_another_variable == 5):
    print "condition is true"
if (2 + 3 + 4) - (1 + 1 + 1) == 6:
    print "condition is true"
```

Consider refactoring your statement into a function if it becomes too long, or the meaning isn't clear.

Bad Example:

```
if price * tax - bonus / reduction + fee < money:
    product.pay(money)</pre>
```

Good Example:

```
def calculate_price(price, tax, bonus, reduction, fee):
    return price * tax - bonus / reduction + fee
final_price = calculate_price(price, tax, bonus, reduction, fee)
```

```
if final_price < money:
    product.pay(money)</pre>
```

11.9.2 Naming

- Class names are in CamelCase
- File names are in lower_underscore_case

Conventions for functions prefixed by *find*:

- Return None when nothing is found
- Return an object when a single entity is found
- Return the first element when multiple entities are found

```
Example:
```

```
def find_by_username(username):
    users = [user1, user2, user3]
    user_search = [user for user in users if user.username == username]
    if len(user_search) == 0:
        return None
    return user_search[0]
```

Conventions for functions prefixed by get:

- Raise an Exception when nothing is found
- Return an object when a single entity is found
- Return the first element when multiple entities are found

Example:

```
def get_user(userid):
    users = [user1, user2, user3]
    user_search = [user for user in users if user.userid == userid]
    if len(user_search) == 0:
        raise UserNotFoundError(userid)
    return user_search[0]
```

Conventions for functions prefixed by *find_all*:

- Return an empty list when nothing is found
- Return a list of objects when multiple entites are found

Example:

```
def find_all_users_by_username(username):
    users = [user1, user2, user3]
    user_search = [user for user in users if user.username == username]
    return user_search
```

Magic numbers

Magic numbers should be avoided. Arbitrary values should be assigned to variables with a clear name

Bad example:

```
class TestRanking(unittest.TestCase):
    def test_ranking(self):
        rank = Rank(1, 2, 3)
        self.assertEquals(rank.position, 1)
        self.assertEquals(rank.grade, 2)
        self.assertEquals(rank.session, 3)
```

Good example:

```
class TestRanking(unittest.TestCase):
    def test_ranking(self):
        position = 1
        grade = 2
        session = 3
        rank = Rank(position, grade, session)
        self.assertEquals(rank.position, position)
        self.assertEquals(rank.grade, grade)
        self.assertEquals(rank.session, session)
```

11.9.3 Tests

Tests for a package are placed in their own folder named "tests" inside the package.

Example:

```
package1/
__init__.py
mod1.py
tests/
__init__.py
test_mod1.py
package2/
__init__.py
mod9.py
tests/
__init__.py
test_mod9.py
```

Unit tests should be short, clear and concise in order to make the test easy to understand. A unit test is separated into 3 sections :

- Preconditions / Preparations
- Thing to test
- Assertions

Sections are separated by a blank line. Sections that become too big should be split into smaller functions.

Example:

```
class UserTestCase(unittest.TestCase):
   def test_fullname(self):
        user = User(firstname='Bob', lastname='Marley')
        expected = 'Bob Marley'
        fullname = user.fullname()
       self.assertEquals(expected, fullname)
   def _prepare_expected_user(self, firstname, lastname, number):
       user = User()
       user.firstname = firstname
       user.lastname = lastname
       user.number = number
       return user
   def _assert_users_are_equal(expected_user, actual_user):
        self.assertEquals(expected_user.firstname, actual_user.firstname)
        self.assertEquals(expected_user.lastname, actual_user.lastname)
       self.assertEquals(expected_user.number, actual_user.number)
   def test_create_user(self):
       expected = self._prepare_expected_user('Bob', 'Marley', '4185551234')
        user = create_user('Bob', 'Marley', '4185551234')
        self._assert_users_are_equal(expected, user)
```

11.9.4 Exceptions

Exceptions should not be used for flow control. Raise exceptions only for edge cases, or when something that isn't usually expected happens.

Bad Example:

```
def is_user_available(user):
    if user.available():
        return True
    else:
        raise Exception("User isn't available")

try:
    is_user_available(user)
except Exception:
    disable_user(user)
```

Good Example:

```
def is_user_available(user):
    if user.available():
        return True
    else:
        return False

if not is_user_available(user):
    disable_user(user)
```

Avoid throwing Exception. Use one of Python's built-in Exceptions, or create your own custom Exception. A

list of exceptions is available on the Python documentation website.

Bad Example:

```
def get_user(userid):
    user = session.query(User).get(userid)
    if not user:
        raise Exception("User not found")
```

Good Example:

```
class UserNotFoundError(LookupError):
    def __init__(self, userid):
        message = "user with id %s not found" % userid
        LookupError.__init__(self, message)
    def get_user(userid):
        user = session.query(User).get(userid)
        if not user:
            raise UserNotFoundError(userid)
```

Never use except: without specifying any exception type. The reason is that it will also catch important exceptions, such as KeyboardInterrupt and OutOfMemory exceptions, making your program unstoppable or continuously failing, instead of stopping when wanted.

Bad Example:

```
try:
    get_user(user_id)
except:
    logger.exception("There was an error")
```

Good Example:

```
try:
    get_user(user_id)
except UserNotFoundError as e:
    logger.error(e.message)
    raise
```

11.10 Translating XiVO

French and English are maintained by Avencall. Other languages are provided by the community.

11.10.1 Asterisk and XiVO Prompts

Avencall is in contact with several studios for different languages and prompts. The information for those languages are :

- French : Super Sonic productions (supersonicprod@wanadoo.fr)
- English : Asterisk voice (allison@theasteriskvoice.com)
- German : ATS studio
- Italian : ATS studio

Prompts transcripts are listed in Transifex (*-prompts). You may translate them there.

The prompts used in XiVO are stored in xivo-sounds git repository. You may also want to generate your own sound files.

11.10.2 XiVO Client

All translations are in Transifex (xivo-client). The source language is English. Translations are synchronised with the code before every release.

11.10.3 Web Interface

Translations are currently available in French and English. There are no plans to translate the Web interface in other languages.

11.11 XiVO Package File Structure

11.11.1 Package naming

Let's assume we want to organise the files for xivo-confd.

- Git repo name: xivo-confd
- Binary file name: xivo-confd
- Python package name: xivo_confd

```
xivo-confd
|-- bin
| `-- xivo-confd
|-- contribs
    `-- docker
|-- ...
        `-- prod
`-- ...
|-- debian
   `-- ...
1
|-- Dockerfile
|-- docs
   `-- ...
1
|-- etc
   `-- ...
|-- integration-tests
    `-- ...
|-- LICENSE
|-- README.md
|-- requirements.txt
|-- setup.cfg
|-- setup.py
|-- test-requirements.txt
|-- .travis.yml
`-- xivo_confd
    `-- ...
```

Sources

etc/ Contains default configuration files.

- **docs**/ Contains technical documentation for this package: API doc, architecture doc, diagrams, ... Should be in RST format using Sphinx.
- bin/ Contains the binaries. Not applicable for pure libraries.
- integration-tests/ Contains the tests bigger than unit-tests. Tests should be runnable simply, e.g.
 nosetests integration-tests.

README.md Read me in markdown (Github flavor).

LICENSE License (GPLv3)

.travis.yml Travis CI configuration file

Python

Standard files:

- setup.py
- setup.cfg
- requirements.txt
- test-requirements.txt
- xivo_confd/ (the main sources)

Debian

debian/ Contains the Debian packaging files (control, rules, ...)

Docker

Dockerfile Used to build a docker image for a working production version

- contribs/docker/prod/ Contains the files necessary for running xivo-confd inside a production Docker image
- contribs/docker/other/ Contains the Dockerfile and other files to run xivo-confd inside Docker with
 specific configuration

11.11.2 File naming

- PID file: /var/run/xivo-confd/xivo-confd.pid
- WSGI socket file: /var/run/xivo-confd/xivo-confd.sock
- Config file: /etc/xivo-confd/config.yml
- Log file: /var/log/xivo-confd.log
- Static data files: /usr/share/xivo-confd
- Storage data files: /var/lib/xivo-confd

Component specific information:

11.12 CTI Server

This section describes the informations and tools for CTI Server.

11.12.1 CTI Proxy

Here's how to run the various CTI client-server development/debugging tools. These tools can be found on GitLab, in the XiVO project.

```
You can get the scripts by using Git:
```

```
$ git clone https://gitlab.com/xivo.solutions/xivo-tools.git
```

General Information

Both the ctispy, ctisave and ctistat tools work in a similar way. They both are proxies that need to be inserted between the CTI client and the CTI server message flow.

To do this, you first start the given tool on your development machine, giving it the CTI server hostname as the first argument. You then configure your CTI client to connect to the tool on port 50030 (notice the trailing 0). The tool should then accept the connection from the client, and once this is done, will make a connection to the server, thereby being able to process all the information sent between the client and the server.

In the following examples, we suppose that the CTI server is located on the host named xivo-new.

Tools

ctispy

ctispy can be used to see the message flow between the client and the server in "real-time".

The simplest invocation is:

\$ cti-proxy/ctispy xivo-new

You can pretty-print the messages if you want by using the --pretty-print option:

\$ cti-proxy/ctispy xivo-new --pretty-print

By default, each message is displayed separately even though more than one message can be in a single TCP packet. You can also use the -raw option if you want to see the raw traffic between the client and the server:

\$ cti-proxy/ctispy xivo-new --raw

Note that when using the --raw option, some other option doesn't work because the messages are not decoded/analyzed.

If you want to remove some fields from the messages, you can use the --strip option:

\$ cti-proxy/ctispy xivo-new --strip timenow --strip commandid --strip replyid

If you want to see only messages matching a certain key and value, use the --include option:

\$ cti-proxy/ctispy xivo-new --include class=getlist

Finally, you can ignore all the messages from the client or the server by using the --no-client or --no-server option respectively.

By default, ctispy will exit after the connection with the client is closed. You can bypass this behavior with the --loop option, that will make the CTI proxy continue, whether the client is connected or not.

ctisave

ctisave save the messages from the client and the server in two separate files. This is useful to do more careful post-analysis.

The simplest invocation is:

\$ cti-proxy/ctisave xivo-new /tmp/cti-client /tmp/cti-server

To do comparison, it's often useful to strip some fields:

\$ cti-proxy/ctisave xivo-new /tmp/cti-client /tmp/cti-server --strip timenow --strip commandid --strip replyid

One useful thing to do with files generated from different ctisave invocation is to compare them with a tool like vimdiff, for example:

| e <u>E</u> dit <u>V</u> iew <u>T</u> erminal Ta <u>b</u> s <u>H</u> elp | |
|---|---|

ctistat

ctistat display various statistic about a CTI "session" when it ends.

The simplest invocation is:

\$ cti-proxy/ctistat xivo-new

11.12.2 CTI Protocol

Protocol Changelog

The versions below indicate the xivo version followed by the protocol version.

Warning: The CTI server protocol is subject to change without any prior warning. If you are using this protocol in your own tools please be sure to check that the protocol did not change before upgrading XiVO

16.11 - 2.2

• the user_id field has been added back to the User status update

16.09 - 2.2

- the Register user status update now uses the user_uuid instead of the user_id
- the User status update now uses the user_uuid instead of the user_id

16.04 - 2.1

• the Chitchat command to and from fields are now a list of two strings, xivo_uuid and user_uuid.

16.01 - 2.0

- the lastconnswins field has been removed from the Login capas command
- the loginkind field has been removed from the Login capas command
- the *ipbxcommands* and *regcommands* capakinds have been removed from *Login capas* command
- the *Login password* command has been modified. The *hashedpassword* has been replaced by the *password* field which is now sent verbatim.

15.20 - 1.2

• the STARTTLS command has been added

15.19 - 1.2

- the *Chitchat* command *to* field is now a list of two elements, *xivo_uuid* and *user_id*.
- the getlist command has been removed for the *channels* listname.
- many fields have been removed from the getlist command.
 - users list
 - * enableclient
 - * profileclient
 - phones
 - * context

- * protocol
- * simultcalls
- * channels
- voicemails
 - * email
 - * fullname
 - * old
 - * waiting
- agents
 - * phonenumber
- some ipbxcommands have been removed:
 - mailboxcount
 - atxfer
 - transfer
 - hangup
 - originate

15.18 - 1.2

- add the Attended transfer to voicemail command
- add the Blind transfer to voicemail command
- the *Send fax* command now include the size and data field.
- the *filetransfer* command has been removed.

15.16 - 1.2

- the Get relations command was added.
- the *Relations* message was added.

15.14 - 1.2

- the people_purge_personal_contacts message was added.
- the people_personal_contacts_purged message was added.
- the people_personal_contact_raw message was added.
- the people_personal_contact_raw_result message was added.
- the people_edit_personal_contact message was added.
- the people_personal_contact_raw_update message was added.
- the people_import_personal_contacts_csv message was added.
- the people_import_personal_contacts_csv_result message was added.
- the people_export_personal_contacts_csv message was added.
- the people_export_personal_contacts_csv_result message was added.

• for messages people_personal_contact_deleted and people_favorite_update there are no longer data sub-key.

15.13 - 1.2

- for channel status update message:
 - the value of commstatus have been changed from linked-caller and linked-called to linked.
 - the key direction have been removed.
 - the key talkingto_kind have been removed.
- the people_personal_contacts message was added.
- the people_personal_contacts_result message was added.
- the people_create_personal_contact message was added.
- the people_personal_contact_created message was added.
- the people_delete_personal_contact message was added.
- the people_personal_contact_deleted message was added.

15.12 - 1.2

- people_search_result has a new key in relations: source_entry_id
- the people_favorites message was added.
- the people_favorites_result message was added.
- the people_set_favorite message was added.
- the people_favorite_update message was added.

15.11 - 1.2

• the fax_progress message was added.

15.09 - 1.2

• for messages of class history the client cannot request by mode anymore. The server returns all calls and the mode is now metadata for each call.

14.24 - 1.2

- for messages of class ipbxcommand, the command record and sipnotify have been removed.
- the logfromclient message has been removed

14.22 - 1.2

• for messages of class faxsend, the steps file_decoded and file_converted have been removed.

14.06 - 1.2

• the dial_success message was added

14.05 - 1.2

• the unhold_switchboard command was renamed resume_switchboard.

13.22 - 1.2

• the actionfiche message was renamed call_form_result.

13.17 - 1.2

• for messages of class login_capas from server to client: the key presence has been removed.

13.14 - 1.2

- for messages of class getlist, list agents and function updatestatus: the key availability in the status object/dictionary has changed values:
 - deleted values: on_call_non_acd_incoming and on_call_non_acd_outgoing
 - added values: * on_call_non_acd_incoming_internal *
 on_call_non_acd_incoming_external * on_call_non_acd_outgoing_internal
 * on_call_non_acd_outgoing_external

13.12 - 1.2

- for messages of class getlist, list agents and function updatestatus: the key availability in the status object/dictionary has changed values:
 - deleted value: on_call_non_acd
 - added values: on_call_non_acd_incoming and on_call_non_acd_outgoing

13.10 - 1.2

• for messages of class getlist and function updateconfig, the config object/dictionary does not have a rules_order key anymore.

Commands

Objects have the format: "<type>:<xivoid>/<typeid>"

- <type> can take any of the following values: user, agent, queue, phone, group, meetme, ...
- <xivoid> indicates on which server the object is defined
- <typeid> is the object id, type dependant
- e.g. user:xivo-test/5 I'm looking for the user that has the ID 5 on the xivo-test server.

Here is a non exaustive list of types:

• exten

- user
- vm_consult
- voicemail

Agent

Login agent

```
Client -> Server
```

agentphonenumber is the physical phone set where the agent is going to log on.

Server > Client

• Login successfull :

```
{"function": "updateconfig",
 "listname": "queuemembers",
"tipbxid": "xivo",
"timenow": 1362664323.94,
"tid": "Agent/2002, blue",
"config": {"paused": "0",
            "penalty": "0",
            "membership": "static",
            "status": "1",
            "lastcall": "",
            "interface": "Agent/2002",
            "queue_name": "blue",
            "callstaken": "0"},
"class": "getlist"}
{"function": "updatestatus",
"listname": "agents",
"tipbxid": "xivo",
"timenow": 1362664323.94,
"status": {"availability_since": 1362664323.94,
            "queues": [],
            "on_call": false,
            "availability": "available",
            "channel": null},
  "tid": 7,
  "class": "getlist"}
```

• The phone number is already used by an other agent :

Logout agent

Client -> Server

{"class": "ipbxcommand", "command": "agentlogout", "commandid": 552759274}

Pause

On all queues

```
Client -> Server
```

Un pause agent

On all queues

Client -> Server

Add an agent in a queue

Client -> Server

Remove an agent from a queue

Client -> Server

Listen to an agent

```
Client -> Server
```

Configuration

The following messages are used to retrieve XiVO configuration.

Common fields

- class : getlist
- function : listid
- commandid
- tipbxid
- listname : Name of the list to be retreived : users, phones, agents, queues, voicemails, queuemembers

```
"class": "getlist",
   "commandid": 489035169,
   "function": "listid",
   "tipbxid": "xivo",
   "listname": "....."
}
```

Users configuration

Return a list of configured user id's

Client -> Server

```
{"class": "getlist", "commandid": 489035169, "function": "listid", "listname":

→"users", "tipbxid": "xivo"}
```

Server -> Client

{

```
"class": "getlist",
"function": "listid", "listname": "users",
"list": ["11", "12", "14", "17", "1", "3", "2", "4", "9"],
"tipbxid": "xivo","timenow": 1362735061.17
}
```

User configuration

Return a user configuration

• tid is the userid returned by Users configuration message

Client -> Server

```
{
  "class": "getlist",
  "function": "updateconfig",
  "listname": "users",
  "tid": "17",
  "tpbxid": "xivo", "commandid": 5}
```

```
{
   "class": "getlist",
   "function": "updateconfig",
   "listname": "users",
   "tid": "17",
   "tipbxid": "xivo",
   "timenow": 1362741166.4,
   "config": {
        "enablednd": 0, "destrna": "", "enablerna": 0, "enableunc": 0, "destunc
        ...", "destbusy": "", "enablebusy": 0, "enablexfer": 1,
            "firstname": "Alice", "lastname": "Bouzat", "fullname": "Alice Bouzat",
            "voicemailid": null, "incallfilter": 0, "enablevoicemail": 0, "agentid
        ...";
    }
```

Phones configuration

Client -> Server

Server > Client

```
{"class": "getlist", "function": "listid", "list": ["1", "3", "2", "5", "14", "7",

→"6", "9", "8"],

"listname": "phones", "timenow": 1364994093.38, "tipbxid": "xivo"}
```

Individual phone configuration request:

Server > Client

Agents configuration

Client -> Server

```
{"class": "getlist", "commandid": 1431355191, "function": "listid", "listname":

→"agents", "tipbxid": "xivo"}
```

Queues configuration

```
Client -> Server
```

Server -> Client

Queue configuration

tid is the id returned in the list field of the getlist response message

Client -> Server

```
{
    "function": "updateconfig", "listname": "queues", "tipbxid": "xivo", "timenow":_
    -1382704649.69, "tid": "3",
        "config":
            {"displayname": "red", "name": "red", "context": "default", "number": "3002"}
            ·,
            "class": "getlist"}
```

Voicemails configuration

Client -> Server

```
{"class": "getlist", "commandid": 1034160761, "function": "listid", "listname":

→"voicemails", "tipbxid": "xivo"}
```

Queue members configuration

Client -> Server

```
{"class": "getlist", "commandid": 964899043, "function": "listid", "listname":

→"queuemembers", "tipbxid": "xivo"}
```

Server -> Client

Fax

Send fax

Client -> Server

```
{"class": "faxsend",
  "filename": "contract.pdf",
  "destination", 41400,
  "size": 100000,
  "data": "<base64 of the fax content>"}
```

Fax status

- pages: number of pages sent (NULL if FAILED)
- status
 - FAILED: Failed to send fax.
 - PRESENDFAX: Fax number exist and converting pdf->tiff has been done.
 - SUCCESS: Fax sent with success.

{"class": "fax_progress", "status": "SUCCESS", "pages": 2 }

Call control commands

Dial

- destination can be any number
- destination can be a pseudo URL of the form "type:ibpx/id"

Client -> Server

```
{
   "class": "ipbxcommand",
   "command": "dial",
   "commandid": <commandid>,
   "destination": "exten:xivo/<extension>"
}
```

For example :

```
{
    "class": "ipbxcommand",
    "command": "dial",
    "commandid": 1683305913,
    "destination": "exten:xivo/1202"
}
```

The server will answer with either an error or a success:

```
{
    "class": "ipbxcommand",
    "error_string": "unreachable_extension:1202",
}
{
    "class": "dial_success",
    "exten": "1202"
}
```

Attended transfer to voicemail

Transfer the current call to a given voicemail and listen to the message before completing the transfer.

```
Client -> Server
```

```
{
   "class": "attended_transfer_voicemail",
   "voicemail": "<voicemail number>"
}
```

Blind transfer to voicemail

Transfer the current call to a given voicemail.

```
Client -> Server
```

```
"class": "blind_transfer_voicemail",
    "voicemail": "<voicemail number>"
}
```

Login

Once the network is connected at the socket level, the login process requires three steps. If one of these steps is omitted, the connection is reset by the cti server.

- login_id, the username is sent as a login to the cti server, cti server answers by giving a sessionid
- login_pass, the password is sent to the cti server, cti server answers by giving a capaid
- login_capas, the capaid is returned to the server with the user's availability, cti server answers with a list of info relevant to the user

```
"commandid": <commandid>,
"class": "login_id",
}
```

- class: defined what class of command use.
- commandid : a unique integer number.

Login ID

```
Client -> Server
```

```
{
"class": "login_id",
"commandid": 1092130023,
"company": "default",
"ident": "X11-LE-24079",
"lastlogout-datetime": "2013-02-19T11:13:36",
"lastlogout-stopper": "disconnect",
"userlogin": <userlogin>,
"xivoversion": "<cti protocol version>"
}
```

Server -> Client

```
"class": "login_id",
"sessionid": "21UaGDfst7",
"timenow": 1361268824.64,
"xivoversion": "<cti protocol version>"
}
```

Note: sessionid is used to calculate the hashed password in next step

Login password

Client -> Server

```
"class": "login_pass",
"password": "secret",
"commandid": <commandid>
}
```

Server -> Client

```
{
    "capalist": [
        2
    ],
    "class": "login_pass",
    "replyid": 1646064863,
    "timenow": 1361268824.68
}
```

If no CTI profile is defined on XiVO for this user, the following message will be sent:

```
{
    "error_string": "capaid_undefined",
    "class": "login_pass",
    "replyid": 1646064863,
    "timenow": 1361268824.68
}
```

Note: the first element of the capalist is used in the next step login_capas

Login capas

```
Client -> Server
```

```
{
"capaid": 3,
"commandid": <commandid>,
"state": "available",
"class": "login_capas"
}
```

Server -> Client

First message, describes all the capabilities of the client, configured at the server level

- presence : actual presence of the user
- userid : the user id, can be used as a reference

```
• capas
```

- userstatus [a list of available statuses]
 - status name
 - * color
 - * selectionnable status from this status
 - * default action to be done when this status is selected
 - * long name
- services : list of availble services

- phonestatus : list of available phonestatuses with default colors and descriptive names
- capaxlets : List of xlets configured for this profile
- appliname

```
{
  "class": "login_capas"
  "presence": "available",
   "userid": "3",
  "ipbxid": "xivo",
  "timenow": 1361440830.99,

  "source": "my_ldap_directory"
  "source_entry_id": "55"
  "favorite": true
}
```

Server -> Client

```
"class": "people_favorite_update",
"source": "my_ldap_directory"
"source_entry_id": "55"
"favorite": true
```

{

STARTTLS

The STARTTLS command is used to upgrade a connection to use SSL. Once connected, the server send a starttls offer to the client which can reply with a starttls message including the status field. The server will then send a starttls message back to the client with the same status and start the handshake if the status is true.

```
Server -> Client
```

```
{
    "class": "starttls"
}
```

Client -> Server -> Client

```
{
    "class": "starttls",
    "status": true
}
```

Note: a client which does not reply to the starttls offer will keep it's unencrypted connection.

Personal contacts list

```
Client -> Server
```

```
{
   "class": "people_personal_contacts"
}
```

```
Server -> Client
```

```
{
 "class": "people_personal_contacts_result",

  }
```

Statistics

Subscribe to queues stats

This message can be sent from the client to enable statitics update on queues

```
Client -> Server
```

```
{"commandid":36,"class":"subscribetoqueuesstats"}
``Server > Client``
```

Get queues stats

When statistic update is enable by sending message Subscribe to queues stats.

The first element of the message is the queue id

Status

These messages can also be received without any request as unsolicited messages.

User status

User status is to manage user presence

• Request user status update

Client -> Server

```
{"class": "getlist", "commandid": 107712156,
   "function": "updatestatus",
   "listname": "users",
   "tid": "14", "tipbxid": "xivo"}
```

Server > Client

```
{"class": "getlist",
    "function": "updatestatus",
    "listname": "users",
    "status": {"availstate": "outtolunch", "connection": "yes"},
        "tid": "1", "timenow": 1364994093.48, "tipbxid": "xivo"}
```

Change User status

Client -> Server

```
{"availstate": "away",
    "class": "availstate",
    "commandid": 1946092392,
    "ipbxid": "xivo",
        "userid": "1"}
```

Server > Client

```
{"class": "getlist",
    "function": "updatestatus",
    "listname": "users",
```

```
"status": {"availstate": "away"},
"tid": "1", "timenow": 1370523352.6, "tipbxid": "xivo"}
```

Phone status

• tid is the line id, found in linelist from message User configuration

Client -> Server

```
{"class": "getlist", "commandid": 107712156,
    "function": "updatestatus",
    "listname": "phones", "tid": "8", "tipbxid": "xivo"}
```

Server > Client

```
{"class": "getlist",
   "function": "updatestatus",
   "listname": "phones",
   "status": {"hintstatus": "0"},
   "tid": "1",
   "timenow": 1364994093.48,
   "tipbxid": "xivo"}
```

Queue status

Client -> Server

Server > Client

```
{"function": "updatestatus", "listname": "queues", "tipbxid": "xivo", "timenow":_

→1382710430.54,

"status": {"agentmembers": ["1","5"], "phonemembers": ["8"]},

"tid": "8", "class": "getList"}
```

Agent status

• tid is the agent id.

Client -> Server

```
{"class": "getlist",
    "commandid": <random_integer>,
    "function": "updatestatus",
    "listname": "agents",
    "tid": "635",
    "tipbxid": "xivo"}
```

Server > Client

```
{"class": "getlist",
   "listname": "agents",
   "function": "updatestatus",
   "tipbxid": "xivo",
   "tid": 635,
```

- availability can take the values:
 - logged_out
 - available
 - unavailable
 - on_call_nonacd_incoming_internal
 - on_call_nonacd_incoming_external
 - on_call_nonacd_outgoing_internal
 - on_call_nonacd_outgoing_external
- availability_since is the timestamp of the last availability change
- queues is the list of queue ids from which the agent receives calls

Switchboard

Answer

This allows the switchboard operator to answer an incoming call or unhold a call on-hold.

{"class": "answer", "uniqueid": "12345667.89"}

Unsolicited Messages

These messages are received whenever one of the following corresponding event occurs: sheet message on incoming calls, or updatestatus when a phone status changes.

Sheet

This message is received to display customer information if configured at the server side

```
{
   "timenow": 1361444639.61,
   "class": "sheet",
   "compressed": true,
   "serial": "xml",
   "payload": "AAADnnicndPBToNAEAbgV1n3XgFN1AP......",
   "channel": "SIP/e6fhff-00000007"
}
```

How to decode payload :

```
>>> b64content = base64.b64decode(<payload content>)
>>> # 4 first cars are the encoded lenght of the xml string (in Big Endian format)
>>> xmllen = struck.unpack('>I', b64content[0:4])
>>> # the rest is a compressed xml string
>>> xmlcontent = zlib.decompress(toto[4:])
>>> print xmlcontent
<?xml version="1.0" encoding="utf-8"?>
       <profile>
               <user>
                      <internal name="ipbxid"><![CDATA[xivo]]></internal>
                      <internal name="where"><![CDATA[dial]]></internal>

               </user>
       </profile>
```

The xml file content is defined by the following xsd file: xivo-javactilib/src/main/xsd/sheet.xsd (online version)

Phone status update

Received when a phone status change

- class : getlist
- function : updatestatus
- listname : phones

```
{
  "class": "getlist",
  "function": "updatestatus",
  "listname": "phones",
  "tipbxid": "xivo",
  "timenow": 1361447017.29,
  .........
}
```

tid is the the object identification

Example of phone messages received when a phone is ringing :

```
{.... "status": {"hintstatus": "0"}, "tid": "3"}
{.... "status": {"hintstatus": "8"}, "tid": "3"}
```

Update notification

Register agent status update

The *register_agent_status_update* command is used to register to the status updates of a list of agent. Once registered to a agent's status, the client will receive all *Agent status update* events for the registered agents.

This command should be sent when an agent is displayed in the people xlet to be able to update the agent status icon.

The Unregister agent status update command should be used to stop receiving updates.

```
Client -> Server
```

Unregister agent status update

The unregister_agent_status_update command is used to unregister from the status updates of a list of agent.

Once unregistered, the client will stop receiving the Agent status update events for the specified agents.

```
Client -> Server
```

```
{
  "class": "unregister_agent_status_update",
  "agent_ids": [["<xivo-uuid>", "<agent-id1>"],
        ["<xivo-uuid>", "<agent-id2>"],
        ...,
        ["<xivo-uuid>", "<agent-idn>"]],
   "commandid": <commandid>
}
```

Agent status update

The agent_status_update event is received when the presence of an agent changes.

To receive this event, the user must first register to the event for a specified agent using the *Register agent status update* command.

To stop receiving this event, the user must send the Unregister agent status update command.

- data, a dictionary containing 3 fields:
 - agent_id, is an integer containing the ID of the user affected by this status change
 - xivo_uuid: a string containing the UUID of the XiVO that sent the status update
 - status: a string containing the new status, "logged_in" or "logged_out"

```
Server -> Client
```

```
"class": "agent_status_update",
"data": {
```

```
"agent_id": 42,
"xivo_uuid": "<the-xivo-uuid>",
"status": "<status-name>"
}
}
```

Register endpoint status update

The *register_endpoint_status_update* command is used to register to the status updates of a list of lines. Once registered to a endpoint's status, the client will receive all *Endpoint status update* events for the registered agents.

This command should be sent when a endpoint is displayed in the people xlet to be able to update the agent status icon.

The Unregister endpoint status update command should be used to stop receiving updates.

```
Client -> Server
```

```
{
  "class": "register_endpoint_status_update",
  "endpoint_ids": [["<xivo-uuid>", "<endpoint-id1>"],
        ["<xivo-uuid>", "<endpoint-id2>"],
        ...,
        ["<xivo-uuid>", "<endpoint-idn>"]],
   "commandid": <commandid>
}
```

Unregister endpoint status update

The *unregister_endpoint_status_update* command is used to unregister from the status updates of a list of agent. Once unregistered, the client will stop receiving the *Endpoint status update* events for the specified agents.

Client -> Server

```
"class": "unregister_endpoint_status_update",
"endpoint_ids": [["<xivo-uuid>", "<endpoint-id1>"],
        ["<xivo-uuid>", "<endpoint-id2>"],
        ...,
        ["<xivo-uuid>", "<endpoint-idn>"]],
"commandid": <commandid>
}
```

Endpoint status update

The *endpoint_status_update* event is received when the status of a line changes.

To receive this event, the user must first register to the event for a specified endpoint using the *Register endpoint* status update command.

To stop receiving this event, the user must send the Unregister endpoint status update command.

- data, a dictionary containing 3 fields:
 - endpoint_id, is an integer containing the ID of the line affected by this status change
 - xivo_uuid: a string containing the UUID of the XiVO that sent the status update
 - status: an integer matching an entry in the cti hint configuration

```
Server -> Client
```

```
{
  "class": "endpoint_status_update",
  "data": {
    "endpoint_id": 42,
    "xivo_uuid": "<the-xivo-uuid>",
    "status": <hint-status>
  }
}
```

Register user status update

The *register_user_status_update* command is used to register to the status updates of a list of user. Once registered to a user's status, the client will receive all *User status update* events for the registered users.

This command should be sent when a user is displayed in the people xlet to be able to update the presence status icon.

The Unregister user status update command should be used to stop receiving updates.

```
Client -> Server
```

```
{
  "class": "register_user_status_update",
  "user_ids": [["<xivo-uuid>", "<user-uuid1>"],
        ["<xivo-uuid>", "<user-uuid2>"],
        ...,
        ["<xivo-uuid>", "<user-uuidn>"]],
   "commandid": <commandid>
}
```

Unregister user status update

The unregister_user_status_update command is used to unregister from the status updates of a list of user.

Once unregistered, the client will stop receiving the User status update events for the specified users.

```
Client -> Server
```

```
"class": "unregister_user_status_update",
"user_ids": [["<xivo-uuid>", "<user-uuid1>"],
        ["<xivo-uuid>", "<user-uuid2>"],
        ...,
        ["<xivo-uuid>", "<user-uuidn>"]],
"commandid": <commandid>"]
```

User status update

The *user_status_update* event is received when the presence of a user changes.

To receive this event, the user must first register to the event for a specified user using the *Register user status update* command.

To stop receiving this event, the user must send the Unregister user status update command.

- data, a dictionary containing the following fields:
 - user_uuid, a string containing the UUID of the user.

- user_id, an integer containing the ID of the user.
- xivo_uuid: a string containing the UUID of the XiVO that sent the status update
- status: a string containing the new status of the user based on the cti profile configuration

Note: When multiple XiVO share user statuses, the cti profile configuration for presences and phone statuses should match on all XiVO to be displayed properly

Server -> Client

}

```
"class": "user_status_update",
"data": {
    "user_uuid": "<the-user-uuid>",
    "user_id": <the-user-id>,
    "xivo_uuid": "<the-xivo-uuid>",
    "status": "<status-name>"
}
```

Warning: The user_id field is DEPRECATED and should not be used. Use the user_uuid field instead.

CTI server implementation

In the git repository https://gitlab.com/xivo.solutions/xivo-ctid

- cti_config handles the configuration coming from the WEBI
- *interfaces/interface_ami*, together with *asterisk_ami_definitions*, *amiinterpret* and *xivo_ami* handle the AMI connections (asterisk)
- *interfaces/interface_info* handles the CLI-like connections
- interfaces/interface_webi handles the requests and signals coming from the WEBI
- *interfaces/interface_cti* handles the clients' connections, with the help of *client_connection*, and it often involves *cti_command* too
- innerdata is meant to be the place where all statuses are computed and stored

The main loop uses *select()* syscall to dispatch the tasks according to miscellaneous incoming requests.

Requirements for innerdata:

- the properties fetched from the WEBI configuration shall be stored in the relevant xod_config structure
- the properties fetched from elsewhere shall be stored in the relevant xod_status structure
- at least two kinds of objects are not "predefined" (as are the phones or the queues, for instance)
 - the channels (in the asterisk SIP/345-0x12345678 meaning)
 - the group and queue members shall be handled in a special way each

The purpose of the 'relations' field, in the various structures is to keep track of relations and cross-relations between different objects (a phone logged in as an agent, itself in a queue, itself called by some channels belonging to phones ...).

CTI server Message flow

Messages sent from the CTI clients to the server are received by the CTIServer class. The CTIServer then calls interface_cti.CTI class manage_connection method. The interface_cti uses his

_cti_command_handler member to parse and run the command. The CTICommandHandler get a list of classes that handle this message from the CTICommandFactory. Then the the interface_cti.CTI calls run_commands on the handler, which returns a list of all commands replies.

To implement a new message in the protocol you have to create a new class that inherits the CTICommand class. Your new class should have a static member caller required_fields which is a list of required fields for this class. Your class should also have a conditions static member which is a list of tupples of conditions to detect that an incoming message matches this class. The __init__ of your class is responsible for the initialization of it's fields and should call super (<ClassName>, self).__init__ (msg). Your class should register itself to the CTICommandFactory.

```
from xivo_cti.cti.cti_command import CTICommand
from xivo_cti.cti.cti_command_factory import CTICommandFactory
class InviteConfroom(CTICommand):
    required_fields = ['class', 'invitee']
    conditions = [('class', 'invite_confroom')]
    def __init__(self):
        super(InviteConfroom, self).__init__(msg)
        self._invitee = msg['invitee']
CTICommandFactory.register_class(InviteConfroom)
```

Each CTI commands has a callback list that you can register to from anywhere. Each callback function will be called when this message is received with the command as parameter.

Refer to MeetmeList.___init___ for a callback registration example and to MeetmeList.invite for the implementation of a callback.

Note: The client's connection is injected in the command instance before calling callbacks functions. The client's connection is an interface_cti.CTI instance.

11.13 Database

11.13.1 Adding a Migration Script

Strating with XiVO 14.08, the database migration is handled by alembic.

The XiVO migration scripts can be found in the xivo-manage-db repository.

On a XiVO, they are located in the /usr/share/xivo-manage-db directory.

To add a new migration script from your developer machine, go into the root directory of the xivo-manage-db repository. There should be an alembic.ini file in this directory. You can then use the following command to create a new migration script:

PYTHONPATH=. alembic revision -m "<description>"

This will create a file in the alembic/versions directory, which you'll have to edit.

When the migration scripts are executed, they use a connection to the database with the role/user asterisk. This means that new objects that are created in the migration scripts will be owned by the asterisk role and it is thus not necessary (nor recommended) to explicitly grant access to objects to the asterisk role (i.e. no "GRANT ALL" command after a "CREATE TABLE" command).

11.15 Provisioning

This section describes the informations and tools for xivo-provd.

11.15.1 Managing DHCP server configuration

This page considers the configuration files of the DHCP server in /etc/dhcp/dhcpd_update/.

Who modifies the files

The files are updated with the command dhcpd-update, which is also run when updating the provisioning plugins. This commands fetches configurations files from the provd.xivo.solutions server.

How to update the source files

Ensure your modifications are working

- On a XiVO, edit manually the file /etc/dhcp/dhcpd_update/*.conf
- service isc-dhcp-server restart
- If errors are shown in /var/log/daemon.log, check your modifications

Edit the files

- Edit the files in the Git repo xivo-provd-plugins, directory dhcp/
- Push your modifications
- Go in dhcp/
- Run make upload to push your modifications to provd.xivo.solutions. There is no testing version of these files. Once the files are uploaded, they are available for all XiVO installations.

11.15.2 Managing Plugins

Git Repository

Most plugin-related files are available in the xivo-provd-plugins repository. Following examples are relative to the repository directory tree. Any modifications should be preceded by a *git pull*.

Updating a Plugin

We will be using the xivo-cisco-spa plugins family as an example on this page

There is one directory per family. Here is the directory structure for xivo-cisco-spa:

```
plugins/xivo-cisco-spa/
+-- model_name_xxx
+-- model_name_xxx
+-- common
+-- build.py
```

Every plugin has a folder called common which regoups common ressources for each model. Every model has its own folder with its version number.

After modifying a plugin, you must increment the version number. You can modify the file plugin-info to change the version number:

Important: If ever you modify the folder common, you must increment the version number of all the models.

Use Case: Update Firmwares for a given plugin

Let us suppose we want to update firmwares for xivo-snom from 8.7.3.25 to 8.7.3.25 5. Here are the steps to follow :

- 1. Copy folder plugins/xivo-snom/8.7.3.25 to plugins/xivo-snom/8.7.3.25.5
- 2. Update VERSION number in plugins/xivo-snom/8.7.3.25.5/entry.py
- 3. Update VERSION number in plugins/xivo-snom/8.7.3.25.5/plugin-info
- 4. Download new firmwares (.bin files from snom website)
- 5. Update VERSION number and URIs in plugins/xivo-snom/8.7.3.25.5/pkgs/pkgs.db (with uris of down-loaded files from snom website)
- 6. Update sizes and sha1sums in plugins/xivo-snom/8.7.3.25.5/pkgs/pkgs.db (using helper script xivo-tools/dev-tools/check_fw)
- 7. Update plugins/xivo-snom/build.py (duplicate and update section 8.7.3.25 > 8.7.3.25.5)

Test your changes

You have three different methods to test your changes on your development machine.

Always increase plugin version (easiest)

If the production version is 0.4, change the plugin version to 0.4.01, make your changes and upload to testing (see below).

Next modification will change the plugin version to 0.4.02, etc. When you are finished making changes, change the version to 0.5 and upload one last time.

Edit directly on XiVO

Edit the files in /var/lib/xivo-provd/plugins.

To apply your changes, go in xivo-provd-cli and run:

plugins.reload('xivo-cisco-spa-7.5.4')

Disable plugin caching

Edit /etc/xivo/provd/provd.conf and add the line:

cache_plugin: True

Empty /var/cache/xivo-provd and restart provd.

Make your changes in provd-plugins, update the plugin version to the new one and upload to testing (see below). Now, every time you uninstall/install the plugin, the new plugin will be fetched from testing, instead of being cached, even without changing the version.

Uploading to testing

Before updating a plugin, it must be passed through the testing phase. Once it has been approved it can be uploaded to the production server

Important: Before uploading a plugin in the testing provd repository, make sure to git pull the xivo-provd-plugins git repository.

To upload the modified plugin in the testing repo on *provd.xivo.solutions*, you can execute the following command:

\$ make upload

Afterwards, in the web-interface, you must modify the URL in section Configuration \rightarrow Provisioning \rightarrow General to:

`http://provd.xivo.solutions/plugins/1/testing/`

You can then update the list of plugins and check the version number for the plugin that you modified. Don't forget to install the plugin to test it.

Mass-install all firmwares related to a given plugin

Using xivo-provd-cli on a xivo server, one can mass-install firmwares. Following example installs all firmwares for xivo-snom 8.7.3.25.5 plugin (note the auto-completion):

```
xivo-provd-cli> plugins.installed().keys()
[u'xivo-snom-8.7.3.15',
u'xivo-cisco-sccp-legacy',
u'xivo-snom-8.4.35',
u'xivo-snom-8.7.3.25',
u'xivo-aastra-switchboard',
u'xivo-aastra-3.2.2-SP3',
u'xivo-aastra-3.2.2.1136',
u'xivo-cisco-sccp-9.0.3',
u'null',
u'xivo-snom-8.7.3.25.5']
xivo-provd-cli> p = plugins['xivo-snom-8.7.3.25.5']
xivo-provd-cli> p.install_all()
```

Uploading to stable

Once checked, you must synchronize the plugin from *testing* to *stable*. If applicable, you should also update the archive repo.

To download the stable and archive plugins:

```
$ make download-stable
$ make download-archive
```

Go to the *plugins/_build* directory and delete the plugins that are going to be updated. Note that if you are not updating a plugin but you are instead removing it "once and for all", you should instead move it to the archive directory:

```
$ rm -fi stable/xivo-cisco-spa*
```

Copy the files from the directory *testing* to *stable*:

\$ cp testing/xivo-cisco-spa* stable

Go back to the *plugins* directory and upload the files to the stable and archive repo:

\$ make upload-stable
\$ make upload-archive

The file are now up to date and you can test by putting back the *stable* url in the web-interface's configuration:

```
`http://provd.xivo.solutions/plugins/1/stable/`
```

11.15.3 Testing a new SIP phone

Let's suppose you have received a brand new SIP phone that is not supported by the provisioning system of XiVO. You would like to know if it's possible to add auto-provisioning support for it. That said, you have never tested the phone before.

This guide will help you get through the different steps that are needed to add auto-provisioning support for a phone to XiVO.

Prerequisites

Before continuing, you'll need the following:

• a private LAN where only your phones and your test machines are connected to it, i.e. a LAN that you fully control.

Configuring a test environment

Although it's possible to do all the testing directly on a XiVO, it's more comfortable and usually easier to do on a separate, dedicated machine.

That said, you'll still need a XiVO near, since we'll be doing the call testing part on it and not on a separate asterisk.

So, for the rest of this guide, we'll suppose you are doing your tests on a *Debian jessie* with the following configuration:

• Installed packages:

isc-dhcp-server tftpd-hpa apache2

• Example content of the /etc/dhcp/dhcpd.conf file (restart isc-dhcp-server after modification):

```
ddns-update-style none;
default-lease-time 7200;
max-lease-time 86400;
log-facility local7;
subnet 10.34.1.0 netmask 255.255.255.0 {
   authoritative;
   range 10.34.1.200 10.34.1.250;
   option subnet-mask 255.255.255.0;
   option broadcast-address 10.34.1.255;
```

```
option routers 10.34.1.6;
option ntp-servers 10.34.1.6;
option domain-name "my-domain.example.org";
option domain-name-servers 10.34.1.6;
log(concat("[VCI: ", option vendor-class-identifier, "]"));
```

• Example content of the /etc/default/tftpd-hpa file (restart tftpd-hpa after modifcation):

```
TFTP_USERNAME="tftp"
TFTP_DIRECTORY="/srv/tftp"
TFTP_ADDRESS="0.0.0.0:69"
TFTP_OPTIONS="--secure --verbose"
```

With this configuration, files served via TFTP will be in the /srv/tftp directory and those served via HTTP in the /var/www directory.

Testing

}

Adding auto-provisioning support for a phone is mostly a question of finding answers to the following questions.

1. Is it worth the time adding auto-provisioning support for the phone?

Indeed. Adding quality auto-provisioning support for a phone to XiVO requires a non negligible amount of work, if you don't meet any real problem and are comfortable with provisioning in XiVO. Not all phones are born equal. Some are cheap. Some are old and slow. Some are made to work on proprietary system and will only work in degraded mode on anything else.

That said, if you are uncertain, testing will help you clarifying your idea.

2. What is the vendor, model, MAC address and firmware version (if available) of your phone ?

Having the vendor and model name is essential when looking for documentation or other information. The MAC address will be needed later on for some tests, and it's always good to know the firmware version of the phone if you are trying to upgrade to a newer firmware version and you're having some troubles, and when reading the documentation.

3. Is the official administrator guide/documentation available publicly on the vendor web site ? Is it available only after registering and login to the vendor web site ?

Having access to the administrator guide/documentation of the phone is also essential. Once you've found it, download it and keep the link to the URL. If you can't find it, it's probably not worth going further.

4. Is the latest firmware of the phone available publicly on the vendor web site? Is it available only after registering and login to the vendor web site?

Good auto-provisioning support means you need to have an easy way to download the latest firmware of the phone. Ideally, this mean the firmware is downloadable from an URL, with no authentication whatsoever. In the worst case, you'll need to login on some web portal before being able to download the firmware, which will be cumbersome to automatize and probably fragile. If this is the case, it's probably not worth going further.

5. Does the phone need other files, like language files ? If so, are these files available publicly on the vendor web site ? After registering ?

Although you might not be able to answer to this question yet because you might not know if the phone needs such files to be either in English or in French (the two officially supported language in XiVO), you'll need to have an easy access to these files if its the case.

6. Does the phone supports auto-provisioning via DHCP + HTTP (or TFTP) ?

The provisioning system in XiVO is based on the popular method of using a DHCP server to tell the phone where to download its configuration files, and a HTTP (or TFTP) server to serve these configuration files.

Some phones support other methods of provisioning (like TR-069), but that's of no use here. Also, if your phone is only configurable via its web interface, although it's technically possible to configure it automatically by navigating its web interface, it's an **extremely bad** idea since it's impossible to guarantee that you'll still be able to provision the phone on the next firmware release.

If the phone supports both HTTP and TFTP, pick HTTP, it usually works better with the provisioning server of XiVO.

7. What are the default usernames/passwords on the phone to access administrator menus (phone UI and web UI) ? How do you do a factory reset of the phone ?

Although this step is optional, it might be handy later to have these kind of information. Try to find them now, and note them somewhere.

8. What are the DHCP options and their values to send to the phones to tell it where its configuration files are located ?

Once you know that the phone supports DHCP + HTTP provisioning, the next question is what do you need to put in the DHCP response to tell the phone where its configuration files are located. Unless the admin documentation of the phone is really poor, this should not be too hard to find.

Once you have found this information, the easiest way to send it to the phone is to create a custom host declaration for the phone in the /etc/dhcp/dhcpd.conf file, like in this example:

```
host my-phone {
    hardware ethernet 00:11:22:33:44:55;
    option tftp-server-name "http://169.254.0.1/foobar.cfg";
}
```

9. What are the configuration files the phone needs (filename and content) and what do we need to put in it for the phone to minimally be able to make and receive calls on XiVO ?

Now that you are able to tell your phone where to look for its configuration files, you need to write these files with the right content in it. Again, at this step, you'll need to look through the documentation or examples to answer this question.

Note that you only want to have the most basic configuration here, i.e. only configure 1 line, with the right SIP registrar and proxy, and the associated username and password.

10. Do basic telephony services, like transfer, works correctly when using the phone buttons ?

On most phones, it's possible to do transfer (both attended and direct), three-way conferences or put someone on hold directly from the phone. Do some tests to see if it works correctly.

Also at this step, it's a good idea to check how the phone handle non-ascii characters, either in the caller ID or in its configuration files.

11. Does other "standard" features work correctly on the phone ?

For quality auto-provisioning support, you must find how to configure and make the following features work:

- NTP server
- MWI
- function keys (speed dial, BLF, directed pickup / call interception)
- timezone and DST support
- multi language
- DTMF
- · hard keys, like the voicemail hard key on some phone
- non-ASCII labels (line name, function key label)
- non-ASCII caller ID

- backup proxy/registrar
- paging

Once you have answered all these questions, you'll have a good idea on how the phone works and how to configure it. Next step would be to start the development of a new provd plugin for your phone for a specific firmware version.

Table 11.2 – continued from previous page

11.15.4 Configuring a NAT Environment

This is a configuration example to simulate the case of a hosted XiVO, i.e. an environment where:

- the XiVO has a public IP address
- the phones are behind a NAT

In this example, we'll reproduce the following environment:

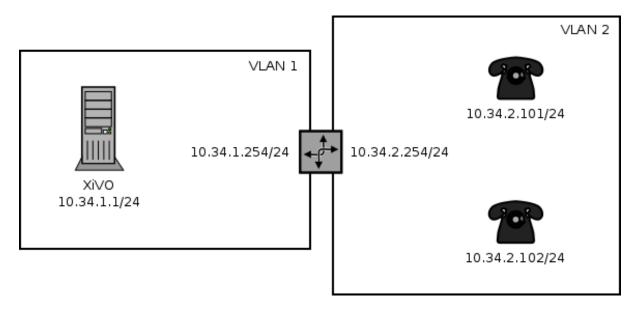

Fig. 11.2: Phones behind a NAT

Where:

- the XiVO is installed inside a virtual machine
- the host machine is used as a router, a NAT and a DHCP server for the phones
- the phones are in a separate VLAN than the XiVO, and when they want to interact with it, they must pass through the NAT

With this setup, we could also put some phones in the same VLAN as the XiVO. We would then have a mixed environment, where some phones are behind the NAT and some phones aren't.

Also, it's easy to go from a non-NAT environment to a NAT environment with this setup. What you usually have to do is only to switch your phone from the "XiVO" VLAN to the "phones" VLAN, and reconfiguring the lines on your XiVO.

The instruction in this page are written for Debian jessie and VirtualBox.

Prerequisite

On the host machine:

- 1 VLAN network interface for the XiVO. In our example, this will be eth0.341, with IP 10.34.1.254/24.
- 1 VLAN network interface for the phones. In our example, this will be eth0.342, with IP 10.34.2.254/24.

On the guest machine, i.e. on the XiVO:

• 1 network adapter attached to the "XiVO" VLAN network interface. In our example, this interface inside the virtual machine will have the IP 10.34.1.1/24.

Configuration

1. On the host, install the ISC DHCP server:

apt-get install isc-dhcp-server

2. If you do not want it to always be started:

```
systemctl disable isc-dhcp-server.service
```

3. Edit the DHCP server configuration file /etc/dhcp/dhcpd.conf. We need to configure the DHCP server to serve network configuration for the phones (Aastra and Snom in this case):

```
ddns-update-style none;
default-lease-time 3600;
max-lease-time 86400;
log-facility daemon;
option space Aastra6700;
option Aastra6700.cfg-server-name code 2 = text;
option Aastra6700.contact-rcs code 3 = boolean;
class "Aastra" {
   match if substring(option vendor-class-identifier, 0, 6) = "Aastra";
   vendor-option-space Aastra6700;
    option Aastra6700.cfg-server-name = "http://10.34.1.1:8667/Aastra";
    option Aastra6700.contact-rcs false;
}
class "Snom" {
   match if substring(option vendor-class-identifier, 0, 4) = "snom";
    option tftp-server-name = "http://10.34.1.1:8667";
    # the domain-name-servers option must be provided for the Snom 715 to work_
→properly
    option domain-name-servers 10.34.1.1;
subnet 192.168.32.0 netmask 255.255.255.0 {
}
subnet 10.34.1.0 netmask 255.255.255.0 {
}
subnet 10.34.2.0 netmask 255.255.255.0 {
    authoritative;
```

```
range 10.34.2.100 10.34.2.199;
option subnet-mask 255.255.255.0;
option broadcast-address 10.34.2.255;
option routers 10.34.2.254;
option ntp-servers 10.34.1.1;
```

- 4. If you have many network interfaces on your host machine, you might also want to edit /etc/default/ isc-dhcp-server to only include the "phones" VLAN network interface in the "INTERFACES" variable.
- 5. Start the isc-dhcp-server:

}

```
systemctl start isc-dhcp-server.service
```

6. Add an iptables rules to do NAT:

iptables -t nat -A POSTROUTING -o eth0.341 -j MASQUERADE

7. Make sure that IP forwarding is enabled:

```
sysctl -w net.ipv4.ip_forward=1
```

- 8. Put all the phones in the "phones" VLAN on your switch
- 9. Activate the NAT and Monitoring options on the Services → IPBX → General settings → SIP Protocol page of your XiVO.

Note that the iptables rules and the IP forwarding setting are not persistent. If you don't make them persistent (not documented here), don't forget to reactivate them each time you want to recreate a NAT environment.

11.16 SCCP

xivo-libsccp is an alternative SCCP channel driver for Asterisk. It was originally based on chan_skinny.

This page is intended for developers and people interested in using xivo-libsccp on something other than XiVO.

11.16.1 Installation from the git repository

Warning: If you just want to use your SCCP phones with XiVO, refer to SCCP Configuration instead.

The following packages are required to compile xivo-libsccp on Debian.

- build-essential
- asterisk-dev

apt-get update && apt-get install build-essential asterisk-dev

```
git clone https://gitlab.com/xivo.solutions/xivo-libsccp.git
cd xivo-libsccp
make
make install
```

11.16.2 Configuration

Warning: If you just want to use your SCCP phones with XiVO, refer to SCCP Configuration instead.

See sccp.conf.sample for a configuration file example.

11.16.3 FAQ

```
Q. When is this *feature X* will be available?
A. The order in which we implement features is based on our client needs. Write
us an email that clearly explain your setup and what you would like to do and we
will see what we can do. We don't provide any timeline.
Q. I want to use the Page() application to call many phones at the same time.
A. Here a Page() example for a one way call (half-duplex):
exten => 1000,1,Verbose(2, Paging to external cisco phone)
same => n,Page(sccp/100/autoanswer&sccp/101/autoanswer,i,120 )
...for a two-way call (full-duplex):
exten => 1000,1,Verbose(2, Paging to external cisco phone)
same => n,Page(sccp/100/autoanswer&sccp/101/autoanswer,di,120 )
```

11.16.4 Network Configuration for 7920/7921

Here's how to to configure a hostapd based AP on a Debian host so that both a 7920 and 7921 Wi-Fi phone can connect to it.

The 7920 is older than the 7921 and is pretty limited in its Wi-Fi functionnality:

- 802.11b
- WPA (no WPA2)
- TKIP (no CCMP/AES)

Which means that the most secure WLAN you can set up if you want both phones to connect to it is not that secure.

- 1. Make sure you have a wireless NIC capable of master mode.
- 2. If needed, install the firmware-<vendor> package. For example, if you have a ralink card like I do:

apt-get install firmware-ralink

3. Install the other dependencies:

```
apt-get install wireless-tools hostapd bridge-utils
```

- 4. Create an hostapd configuration file in /etc/hostapd/hostapd.sccp.conf with content: hostapd.sccp.conf
- 5. Update the following parameters (if applicable) in the configuration file:
 - interface
 - ssid
 - channel

- wpa_passphrase
- 6. Create a new stanza in /etc/network/interfaces:

7. Up the interface:

```
ifup wlan0=wlan-sccp
```

8. Configure your 7920/7921 to connect to the network.

To unlock the phone's configuration menu on the 7921:

- Press the Navigation Button downwards to enter SETTINGS mode
- Navigate to and select Network Profiles
- Unlock the IP phone's configuration menu by pressing **#. The padlock icon on the top-right of the screen will change from closed to open.

When asked for the authentication mode, select something like "Auto" or "AKM".

You don't have to enter anything for the username/password.

9. You'll probably want to bridge your wlan0 interface with another interface, for example a VLAN interface:

```
brctl addbr br0
brctl addif br0 wlan0
brctl addif br0 eth0.341
ip link set br0 up
```

10. If you are using virtualbox and your guest interface is bridged to eth0.341, you'll need to change its configuration and bridge it with br0 instead, else it won't work properly.

11.16.5 Adding Support for a New Phone

This section describes the requirements to consider that a SCCP phone is working with XiVO libsccp.

Basic functionality

- Register on Asterisk
- SCCP reset [restart]
- Call history
- Date time display
- HA

Telephony

These test should be done with and without direct media enabled

- Emit a call
- Receive a call
- Receive and transfer a call
- Emit a call and transfer the call
- Hold and resume a call

- Features (*0 and others)
- Receive 2 calls simultaneously
- Emit 2 calls simultaneously
- DTMF on an external IVR

Function keys

- Redial
- DND
- Hold
- Resume
- New call
- End call
- Call forward (Enable)
- Call forward (Disable)
- Try each button in each mode (on hook, in progress, etc)

Optional options to test and document

- Phone book
- Caller ID and other display i18n
- MWI
- Speeddial/BLF

11.17 Web Interface

11.17.1 Configuration for development

Default error level for XiVO web interface is E_ALL & ~E_DEPRECATED & ~E_USER_DEPRECATED & ~E_RECOVERABLE_ERROR & ~E_STRICT

If you want to display warning or other error in your browser, edit the /etc/xivo/web-interface/xivo. ini and replace report_type level to 3:

```
[error]
level = E_ALL
report_type = 3
report_mode = 1
report_func = 1
email = john.doe@example.com
file = /var/log/xivo-web-interface/error.log
```

You may also edit /etc/xivo/web-interface/php.ini and change the error level, but you will need to restart the cgi:

service spawn-fcgi restart

11.17.2 Interactive debugging in Eclipse

Instructions for Eclipse 4.5.

On your XiVO:

1. Install php5-xdebug:

```
apt-get install php5-xdebug
```

2. Edit the /etc/php5/cgi/conf.d/20-xdebug.ini (or /etc/php5/conf.d/20-xdebug. ini on wheezy) and add these lines at the end:

```
xdebug.remote_enable=1
xdebug.remote_host="<dev_host_ip>"
```

where $< dev_host_ip > is$ the IP address of your machine where Eclipse is installed.

3. Restart spawn-fcgi:

service spawn-fcgi restart

On your machine where Eclipse is installed:

- 1. Make sure you have Eclipse PDT installed
- 2. Create a PHP project named xivo-web-interface:
 - Choose "Create project at existing location", using the xivo-web-interface directory
- 3. In the Window / Preferences / PHP menu:
 - Add a new PHP server with the following information:
 - Name: anything you want
 - Base URL: https://<xivo_ip>
 - Path Mapping:
 - * Path on Server: /usr/share/xivo-web-interface
 - * Path in Workspace: /xivo-web-interface/src
- 4. Create a new PHP Web Application debug configuration:
 - Choose the PHP server you created in last step
 - Pick some file, which can be anything if you don't "break at first line"
 - Uncheck "Auto Generate", and set the path you want your browser to open when you'll launch this debug configuration.

Then, to start a debugging session, set some breakpoints in the code and launch your debug configuration. This will open the page in your browser, and when the code will hit your breakpoints, you'll be able to go through the code step by step, etc.

Community Documentation

11.18 Community Documentation

This page provides links to resources on various topics around XiVO. They have been generously created by people from the community.

11.18.1 Tutorials

Please note that these resources are provided on an "as is basis". They have not been reviewed by the XiVO team, therefore the information presented may be innaccurate. We also accept resources provided in other languages besides English.

11.18.2 Contribute

We gladly accept new contributions. There are two ways to contribute:

• The preferred way: open a pull request on Gitlab and add a line to this page (see: *Contributing to the Documentation*).

Note that we only accept documents in open formats, such as PDF or ODF.

CHAPTER 12

Release Notes

12.1 Aldebaran (2018.LTS3)

| Component | latest ver. |
|---------------------|-------------|
| config-mgt | 2018.05.02 |
| elasticsearch | 1.7.2 |
| fingerboard | 2018.05.00 |
| kibana_volume | 2018.05.00 |
| nginx | 2018.05.00 |
| pack-reporting | 2018.05.00 |
| pgxivocc | 1.3 |
| recording-rsync | 1.0 |
| recording-server | 2018.05.02 |
| spagobi | 2018.05.00 |
| xivo-db-replication | 2018.05.00 |
| xivo-full-stats | 2018.05.00 |
| XiVO PBX | 2018.05.02 |
| xuc | 2018.05.02 |
| xucmgt | 2018.05.02 |

12.1.1 Aldebaran.02

Note: Bugfix release. See Aldebaran.00 section for features list and behavior changes.

Consult the Aldebaran.02 Roadmap.

Components updated: config-mgt, recording-server, xivo-dist, xucmgt, xucserver

CCAgent

- #1801 Cannot remove activity from favorites when showQueueControls is not set
- #1834 Be able to use XUC API from xucmgt 3rd party app

CCManager

• #1776 - Call Qualifications: export as csv

Config mgt

• #1828 - Disable PlayFramework CSRF protection for REST API request with X-Auth-Token

Recording

- #1787 As supervisor I don't see disk space usage
- #1789 Recording disk usage is inverted in log
- #1823 Cannot use recording control on web agent during an outgoing call or incoming call
- #1832 Recording call status is not always reported on acd outbound calls

Reporting

• #1795 - Queue statistic conversation_time abnormally long

SpagoBi

• #1806 - Null 'key' argument while displaying queue report in SpagoBI

Web Assistant

• #1799 - UC assistant should not allow to hold second call if one is already holded

XUC Server

- #1817 Channel vars not propagated from queue to agent
- #1833 Connected line number and name is not always correct

XiVO PBX

• #1794 - Add borealis in the named distribution of xivo-dist

12.1.2 Aldebaran.01

Note: Bugfix release. See Aldebaran.00 section for features list and behavior changes.

Consult the Aldebaran.01 Roadmap.

Components updated: recording-server

• #1777 - Angular controller load issue on "controle d'enregistrement" tab on the recording server

12.1.3 Aldebaran.00

Note: LTS Release. Below are listed the features, bugfixes and behavior changes.

Consult the Aldebaran.00 Roadmap.

12.1.4 Changes

Aldebaran is the new LTS release of XiVO Solutions, below is a summary of the *New Features* and *Behavior Changes* compared to the previous LTS version, Polaris.

New Features

- XiVO administration web interface has been revamped to make it lighter and more responsive.
- UC assistant can handle conferences with features such as showing participants, including a visual indicator to show who is talking. Added also possibility to Mute/Unmute/Kick participants if you're an organizer of the conference.
 - See *Conference Room* for conference room creation
 - and UC Assistant Conference for usage in UC Assistant
- Personal contacts can be managed now from UC assistant. Possibility to add/edit/delete/import your own contacts from the application (see *Personal contacts*).

Behavior Changes

- Transfers:
 - It is now the forwarded user outgoing caller id which is used as the presentation number for its forwarded call.
 - It is now the forwarded user call rights which are applied to his forwarded call.
- System
 - config-mgt is no longer part of the CC solutions but is coupled directly with XiVO PBX. An automatic
 redirection is done from old URL. Service is visible both from XiVO webi and is part of the xivoservice status list.

12.1.5 Upgrade

Upgrade Polaris to Aldebaran

In this section is listed the manual steps to do when migrating from Polaris to Aldebaran.

Before Upgrade

• If docker is installed (on XiVO PBX or XiVO CC), its custom start options may cause the upgrade to fail. Please check that /etc/systemd/system/docker.service.d directory does not exist or it is empty. Otherwise see documentation on docker web.

On XiVO PBX

- XiVO Aldebaran is only available in **64-bit** versions. To migrate XiVO from 1386 to amd64, you must follow *Migrate XiVO from i386 (32 bits) to amd64 (64 bits)*.
- Configuration files and dialplan subroutine for ACD outgoing calls for call blending (See Polaris documentation) was integrated to XiVO. The configuration **must** be manually removed if it exists:

```
sed -i '/generate_agent_skills.py/d' /etc/asterisk/queueskills.conf
rm /usr/local/sbin/generate_agent_skills.py
rm /etc/asterisk/extensions_extra.d/xuc_outcall_acd.conf
```

- If the XiVO was added to XiVO Centralized User Management, the file routage.conf must be updated.
 - Download the new routage.conf file
 - Replace the old file /etc/asterisk/extensions_extra.d/routage.conf by the new one

• Follow the Upgrading page.

On XiVO CC

• Update distribution to xivo-aldebaran in source list:

After Upgrade

On XiVO PBX

• Outgoing call was removed from redirections.

You MUST check the xivo-upgrade log with the following command:

zgrep MIGRATE_OUTCALL_FWD /var/log/xivo-upgrade.log*

Then you MUST edit each object to reconfigure the changed destination. All Outgoing call redirections can be replaced by an Extension redirection with the appropriate context. For example an outgoing redirection towards "my_outcall (@to-extern)" to number "0123456789" can be replaced by an extension redirection to "0123456789" with context "to-extern"

- ConfigMgt service was moved to XiVO PBX. Here's how to migrate the ConfigMgt database:
 - On your XiVO CC (where the service pgxivocc is run) authorize user root to login with password via ssh,
 - Then on your XiVO CC, stop the services with xivocc-dcomp stop
 - Then, on your XiVO PBX, run the migration script and follow the instruction:

xivo-migrate-configmgt-db

- Finally, when migration is complete, relaunch the services on XiVO CC:

```
xivocc-dcomp up -d --remove-orphans
```

On XiVO CC

• Update new kibana default panels:

```
xivocc-dcomp stop kibana_volumes
docker rm -v xivocc_kibana_volumes_1
xivocc-dcomp up -d
```

12.1.6 Features & bugfixes list

Components updated: **config-mgt**, **recording-server**, **xivo**, **xivo-auth**, **xivo-db-replication**, **xivo-dist**, **xivo-install-script**, **xivo-manage-db**, **xivo-monitoring**, **xivo-service**, **xivo-solutions-doc**, **xivo-web-interface**, **xivocc-installer**, **xucmgt**, **xucserver**

CCManager

• #1769 - Rename statistics "Total" on ccmanager

Config mgt

• #1758 - ConfigMgt status in XiVO when restart is inactive(dead) whereas the docker is running

Recording

- #1085 Recording space alert when limit reached
- #1750 Stop Recording on external transfer

Important: Behavior change Recording will now be stopped upon external transfer of an incoming call. That is if two external parties are bridged together (after a transfer for example), the recording will be stopped. See *Stop recording upon external transfer*.

Reporting

• #1768 - Replicate call qualification configuration

Web Assistant

- #1654 Import/export a personal contact list
- #1657 Name of the personal contact from my call history
- #1658 Name of the personal contact in current call
- #1720 Control my own microphone in a conference room
- #1728 FavoriteUpdated event is not handled anymore once a personal contact is created
- #1735 Mute/UnMute a participant in conference
- #1736 Kick a participant in a conference
- #1771 Updated name of the personal contact in call history

WebRTC

• #731 - [Doc] WebRTC route call when not connected

XUC Server

• #1773 - Add call qualifications interface to xucserver

XiVO PBX

- #1741 Add configmgt webservice to configure call qualification options in the queue WebI section
- #1745 Include Config Mgt in XiVO UC

Important: Behavior change Docker bridge network were changed - from 172.18.0.0/16 to 172.18.0.0/24 for XiVO UC - from 172.18.0.0/16 to 172.18.1.0/24 for Config Mgt

- #1752 Incomprehensible error message when creating a conference with Organizer pin code without Pin code on general tab
- #1757 Get token from xivo-auth to be used by configmgt
- #1763 Configure call qualification options in the queue WebI section

XiVOCC Infra

• #1726 - xivo-docker does not upgrade docker-compose if it already exists

12.2 Aldebaran Intermediate Versions

12.2.1 XiVO Aldebaran Intermediate Versions

2018.04

Consult the 2018.04 Roadmap.

Components updated: **asterisk-xivo-mirror**, **config-mgt**, **packaging**, **xivo**, **xivo-agid**, **xivo-auth**, **xivo-confgend**, **xivo-config**, **xivo-dao**, **xivo-db-replication**, **xivo-dist**, **xivo-full-stats**, **xivo-load-tester**, **xivo-manage-db**, **xivo-provd-plugins**, **xivo-provd-plugins-addons**, **xivo-service**, **xivo-upgrade**, **xivo-web-interface**, **xivoc-installer**, **xucmgt**, **xucserver**

Reporting

- #1591 Wrong answered statistic in kibana sample dashboard
- #1730 Upon shut down, xivo-full-stats can't write agent state if state is wrapup
- #1740 Status answered is never set on table *call_data* for a call on group

Web Assistant

- #1281 List of favorite users stops refreshing after search
- #1651 Edit a personal contact
- #1652 Delete a personal contact
- #1653 Add a personal contact from call history
- #1683 Add visual indicator when a conference participant is talking
- #1721 Display differently the organizer of the current conference
- #1723 Begin the conference only when organizer enters the conference room
- #1747 Do not subscribe to CC statistics when using web assistant

XUC Server

- #1688 Display correct error message when *dird* is incorrectly responding
- #1733 Invalid Agent acd calls and negative Agent unanswered acd calls

XiVO PBX

• #1619 - Include *config-mgt* in XiVO PBX

Important: Component deployment change

- *config-mgt* is no longer part of the CC solutions but is coupled directly with *XiVO PBX*. You can access it at <xivo_ip>:9100. An automatic redirection is done from old URL.
- Service is visible both from XiVO webi and is part of the xivo-service status list.

Warning: It is not possible so far to connect to *config-mgt* with created users, except you manually configure token authentication. See #1758

- #1672 Docker interfaces are removed after applying network configuration from webi
- #1682 BTIP XiVO default answer for sip option messages is "404 not found" and should be "200 ok"
- #1692 Replace old buttons images to something more bootstrap alike
- #1722 Define organizer's code for each conference room to manage participants

- #1724 Close a conference when organizer leaves the conference room
- #1727 Error missing when creating wrong Web service access
- #1738 Add generic token from a config file authentication to xivo-auth

XiVO Provisioning

- #1519 Provision patton SN43XX (FXS) (SN4312/JS,SN4316/JS, SN4324/JS,SN4332/JS)
- #1599 Provision patton SN4120 (BRI)
- #1748 Can't install plugin xivo-patton-SN4120-6.10 v1.1

2018.03

Consult the 2018.03 Roadmap for complete list of features and fixes.

Components updated: asterisk, xivo, xivo-dist, xivo-manage-db, xivo-orchestration-service, xivo-upgrade, xivo-web-interface, config-mgt, xucmgt, xucserver

CCAgent

• #1695 - Agent in non-acd outgoing call has wrong color in CCAgent

Config mgt

• #1622 - Add token authentication to ConfigMgt

Desktop Assistant

• #1701 - Update electron version for fixing security exploit CVE-2018-1000006

SpagoBi

• #1729 - Version 1.2 for Queues and Agents reports

Web Assistant

• #1650 - I want to create a personal contact

XUC Server

- #1709 Outbound queue calls are not displayed as ACD call in CCAgent
- #1710 Agent states : Agent is established instead of dialing
- #1716 Add token authentication to Xuc Server

XiVO PBX

- Asterisk: Ships version 13.19.0 of asterisk (see #1660) whith fixes for:
 - #764 [C] DTMF INFO before answer leads to 200 OK without Contact: header
 - #1373 [C] Asterisk can crash with TCP/TLS when doing a "sip reload"
- #1441 Web-i: Remove "outgoing call" from possible destination for incall
- #1693 Improve xivo-upgrade to install dahdi-linux-modules
- #1694 Unify installation of dahdi-linux-modules for script, upgrade and pxe
- #1700 Missing horizontal form on wizard page

XiVOCC Infra

- #1702 Swarm Authentication for docker swarm services
- #1708 Upgrade from docker-engine to docker-ce

2018.02

Consult the 2018.02 Roadmap for complete list of features and fixes.

Components updated: xivo, xivo-agid, xivo-confgend, xivo-dao, xivo-db-replication, xivo-dist, xivo-lib-python, xivo-monitoring, xivo-upgrade, xivo-web-interface, xivocc-installer, xucmgt, xucserver

CCAgent

• #1635 - Cannot deactivate anymore recording control for agents

CCManager

• #1659 - Edge browser support

Web Assistant

- #1646 I can see the status of a conference room
- #1648 I can see the duration from the beginning of the conference
- #1649 I can see internal and external participant
- #1655 I want to list all personal contact
- #1656 I want to search a personal contact

WebRTC

• #1309 - Point to Point Video in WebRTC Web Assistant

Warning: Experimental feature

See Experimental video call feature section for configuration.

XUC Server

- #1632 Call tracking does not track ISDN (DAHDI) calls
- #1636 Wrong Alert-Info SIP Header for Yealink phones
- #1637 AgentState acd status is set to true if Agent calls a queue
- #1638 Outbound queue calls are not using customized caller id

XiVO PBX

• #1477 - Display user's outgoing caller id when it forwards its calls externally

Important: Behavior change

It is now the forwarded user outgoing caller id which is used as the presentation number for its forwarded call.

Given:

- E : external user
- U1 : internal user with unc. forwarding enabled towards M
- M : external number
- U2 : internal user

| Scenario | Outgoing Caller ID on U1 | Caller ID presented |
|-------------------|--------------------------|---------------------------|
| E -> U1 –fwd–> M | Yes | U1's Caller ID |
| | No | Outgoing rule's Caller ID |
| U2 -> U1 -fwd-> M | Yes | U1's Caller ID |
| | No | Outgoing rule's Caller ID |

• #1478 - Apply user's call permissions to his forwarded calls

Important: Behavior change

It is now the forwarded user call rights which are applied to his forwarded call.

Given:

- user U1 has forwarded his call towards a mobile phone number.
- user U1 has the rights to call a mobile phone number.

Then whatever the call origin, the call will be routed (because user U1 has the rights to).

• #1621 - Install Docker with XiVO

Important: Behavior change

- Docker repository in file /etc/apt/sources.list.d/docker.list is now part of XiVO even if XiVO UC is not
 installed
- Docker and Docker Compose installs on XiVO server
- #1639 Merge Help and Contact menu in only one
- #1640 Make breadcrumb links clickable
- #1641 Reorganize admin rights page
- #1661 Handle properly alll kind of error message display
- #1669 Create dahdi linux package compatible with latest kernel package (for Jessie based XiVO)
- #1670 Create dahdi linux package compatible with latest kernel package (for Wheezy based XiVO)
- #1675 New queue with specific leaveempty/joinempty combination can't be created
- #1678 Prevent 32bit XiVO upgrade to Aldebaran
- #1679 Docker repository in xivo-dist seems not right
- #1685 php-cgi take 100% cpu

XiVO Provisioning

See Plugins release notes.

• #1644 - T48S - In Menu, two keys labelled Annuaire

Important: Behavior change To fix the problem, plugin now uses Yealink default french translation. It introduces some little changes which are listed in the issue.

- #1667 T48S In Menu, two keys labelled Annuaire (v82)
- #1668 New scope DHCP for Cisco SMB 514G phones

XiVOCC Infra

- #1633 Replication error when installing XIVO UC on XiVO PBX
- #1687 Install swarm on xivo and cc

2018.01

Consult the 2018.01 Roadmap for complete list of features and fixes.

Components updated: asterisk, debian-pxelinux, xivo, xivo-agid, xivo-confgend, xivo-config, xivo-dao, xivo-dist, xivo-manage-db, xivo-solutions-doc, xivo-upgrade, xivo-web-interface, xivocc-installer, xucserver

Asterisk

• #1412 - Improve Asterisk versioning and integrate Xivo patches version

CCManager

• #1625 - Abandonned call in queue is removed twice from call list

Switchboard

• #1590 - [C] Problem if a POPC transfer to a SECRETARY-BOSS filter

XUC Server

- #1145 Skill based routing does not work after having installed ACD outgoing calls for call blending
- #1592 Wrapup cannot be resumed if agent is logged in a different phone

XiVO PBX

- #1116 Refresh XiVO web interface Initiate a new UI Look & Feel
- #1418 Default User configuration enablexfer should be unchecked
- #1598 Add xivo-aldebaran-dev to xivo-dist
- #1603 Simplification Voicemail uncheck Get transfered to an operator
- #1610 Callfilter member can't do a direct transfer call when boss/secretary filter is activated
- #1612 Document that our ISO does not support UEFI system

XiVOCC Infra

- #1565 Disable CC Agent and CC Manager in Xivo UC
- #1587 Enhance XiVO PBX build for Aldebaran
